## PREFACE

---

**T**HE material formerly presented by the author of this book as a practical home-study course is now offered as a series of radio and communication engineering books. These volumes may serve as a refresher course for persons already familiar with the subject, or as a study guide in correspondence<sup>1</sup> or residence school courses for those desiring a comprehensive treatment. The reader is more likely to learn correctly and rapidly if this material is used in a plan of directed study. However, for those who do not have time to take advantage of available courses, the books should prove valuable for reading and reference purposes.

This first commercial edition of "Applied Mathematics" has been preceded by four private editions used in a practical home-study course of the Smith Practical Radio Institute. The preparation of this course was started in 1934 to meet the needs of a group of radio broadcasting operators and engineers who had irregular working hours. The course is for the student who has a high-school education or the equivalent and is familiar with the popular terminology used in radio.

Chapters 9 and 10 cover the requirements of simultaneous equations in mesh circuits and quadratic equations in complex circuits having multiple resonance frequencies. The author is indebted to Mr. Daniel B. Hutton for assisting with the preparation of the material in these two chapters.

The advanced section, Chaps. 12 to 15 inclusive, presents a simplified treatment of calculus, series, and wave forms. Elementary calculus concepts assist in understanding the theory, such as that  $di/dt$  expresses the rate of current change with

<sup>1</sup> These books are a part of the general plan for a practical home study course offered by the Cleveland Institute of Radio Electronics Cleveland, Ohio. Further information is available upon request.

respect to time. Another illustration is the determination of impedance matching by maximizing the power transfer. The material on series is given because of their use in evaluating functions and making simple engineering approximations. The treatment of wave forms gives the underlying mathematics for analyzing and synthesizing wave shapes found in television and pulse techniques.

The section devoted to tables and formulas is included to make this mathematics handbook self-contained. The other books of this series will refer to this material whenever it is needed.

The author wishes to acknowledge the helpful cooperation which has been received from all sides. In particular, he wishes to thank the many students who by their constructive criticisms have helped to mold this course into its present form, and Beverly Dudley for his careful reading of the manuscript and for the suggestions that he has made for the improvement of the text in a number of places.

CARL E. SMITH.

# APPLIED MATHEMATICS

## CHAPTER 1

### ARITHMETIC

Mathematics is one of the most valuable tools possessed by the engineer. This is especially true of the radio and communication engineer because the analysis of electric circuits is largely a study of linear equations. An example is the linear relation of Ohm's law,

$$E = IR \quad (1)$$

The simplicity of this law and its extensive use when working out electric problems have in a large measure been responsible for the rapid advance of the electrical industry.

Communication systems in general depend upon three things: (1) sending facilities; (2) transportation facilities in the form of telephone lines and radio links; and (3) receiving facilities. The study of the networks involved in such systems is nothing more than a study of alternating current at audio and radio frequencies. Such a study is materially clarified and simplified if one has the ability to apply the essential mathematics. The mathematics presented in this book is not difficult but must be thoroughly mastered if real progress is to be made through the rest of this series of books. Since many of the readers will have already had this mathematics it should not be a burden for them to answer the exercises at the end of each chapter as a matter of review.

**Signless Numbers.**—The child makes his first acquaintance with numbers in counting the objects of a group. These are simple signless numbers made up of arabic numerals or combinations of arabic numerals, thus

1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, etc.

These signless numbers obey the arithmetic processes of addition and multiplication.

*Example 1.* Add 3 to 6.

*Solution.*  $3 + 6 = 9$ . *Ans.*

*Example 2.* Multiply 2 by 6.

*Solution.*  $2 \times 6 = 12$ . *Ans.*

**Real Numbers.**—As the child's experience increases he will soon desire to use the arithmetic processes of subtraction and division. Occasionally the result cannot be expressed in the simple system of signless numbers. For instance, if the mercury in the thermometer drops below zero, or if he wishes to subtract a large number from a small number, the result is no longer in the simple system of signless numbers.

To expand the number system to take care of all four arithmetic processes, it is necessary to include a zero and negative numbers. The signless numbers will then be considered positive numbers even though no sign is used. This system of real numbers considered thus far is one of whole numbers called "integers" or "integral numbers." Whole numbers are called "even numbers" when exactly divisible by 2 and "odd numbers" when not exactly divisible by 2.

The real number system consists of *zero*; all *whole numbers*; all *rational numbers*, which can be expressed as whole numbers in fraction form; and all *irrational numbers*, which cannot be expressed as simple fractions. For instance, the diagonal of a square having sides one unit in length can be expressed as the square root of 2, thus;  $\sqrt{2}$ . The  $\sqrt{2}$  is an irrational number which cannot be expressed as a simple fraction.

*Example 3.* Harry has \$9 but owes Tom \$12. What is Harry's financial status?

*Solution.*  $\$9 - \$12 = -\$3$ . *Ans.*

This means that he is \$3 in debt. Harry actually owns less than nothing.

*Example 4.* Divide 6 by 2 and state the kind of number that results.

*Solution.*  $6 \div 2 = 3$ . *Ans.*

The answer is a rational odd integral number. In this example, 6 is the *dividend*, 2 is the *divisor*, and 3 is the *quotient*.

*Example 5.* Divide 4 by 6 and state the kind of number that results.

*Solution.*  $\frac{4}{6} = \frac{2}{3}$ . *Ans.*

The answer is a rational number expressed in fraction form.

**Graphical Representation of Real Numbers.**—Real numbers can be considered as points along a straight line as shown in Fig. 1. These points are a measure of the distance from the reference point 0. The negative numbers are in the opposite direction to the positive numbers. For instance, if the numbers represent miles along a road that runs from west to east the positive numbers represent mileage east of the reference point and the negative numbers represent the mileage west of the reference point. A person starting at 0, the reference point, going 8 miles east, in the positive direction, and then turning around and going 18 miles west, in the negative direction, will be 10 miles west of the starting point, in the negative direction. In equation form, this is expressed

$$+8 \text{ miles} - 18 \text{ miles} = -10 \text{ miles} \quad \text{Ans.}$$

As another instance, consider a 4-volt and a 6-volt battery connected in series. If the positive terminal of the 4-volt battery

FIG. 1.—Graphical representation of real numbers.

is connected to the negative terminal of the 6-volt battery and the reference point 0 is considered at the negative end of the 4-volt battery, then the voltage at the positive end of the 6-volt battery is

$$+4 \text{ volts} + 6 \text{ volts} = 10 \text{ volts} \quad \text{Ans.}$$

which is with respect to the reference point 0. Now, if the 6-volt battery is turned around so that the positive terminals of the 4-volt and 6-volt batteries are connected together, the voltage at the negative end of the 6-volt battery, with respect to the reference point 0 at the negative end of the 4-volt battery, is

$$+4 \text{ volts} - 6 \text{ volts} = -2 \text{ volts} \quad \text{Ans.}$$

Smaller values will always be found to the left of the beginning point and larger values will always be found to the right of the beginning point, as shown in Fig. 1.

*Example 6.* Is the fraction  $-\frac{1}{3}$  a larger number than the fraction  $-\frac{2}{3}$ ? Illustrate graphically.

**Solution.** The fraction  $-\frac{1}{2}$  is larger than the fraction  $-\frac{3}{4}$  because it lies to the right as represented graphically in Fig. 2. *Ans.*

**Rules for Addition and Subtraction.**—Adding a negative number ( $-3$ ) is equivalent to subtracting a positive number ( $+3$ ).

Thus  $2 + (-3) = -1$   
or  $2 - (+3) = -1$

When two numbers of unlike sign are to be added, subtract the smaller from the larger and place the sign of the larger in front of the answer.

FIG. 2.—Position of negative fractions with respect to  $-1$ ,  $0$ , and  $+1$ .

If there are several numbers to be added, first, add all the positive numbers; second, add all the negative numbers; and third, subtract the smaller sum from the larger sum and place the sign of the larger in front of the answer.

**Example 7.** Add  $-1$ ,  $-6$ ,  $+4$ ,  $-3$ ,  $+8$ ,  $+2$ .

**Solution.**

$-1$	$+4$	$14 + (-10) = +4$	<i>Ans.</i>
$-6$	$+8$		
$-3$	$+2$		
<hr/>	<hr/>		
$-10$	$+14$		

Subtracting a negative number, such as  $-3$ , is equivalent to adding a positive number, such as  $3$ . The rule for subtraction is to change the sign of the subtrahend and add.

**Example 8.** Subtract  $(-6)$  from  $4$ .

**Solution.**

$4$	minuend
$-6$	subtrahend
<hr/>	
$10$	remainder <i>Ans.</i>

or, in equation form,

$$4 - (-6) = 10 \quad \text{Check.}$$

Addition can be performed in any order, but subtraction must be performed in the order given. For instance, in addition,

$$2 + 3 = 3 + 2 = 5$$

while, in subtraction,

$$2 - 3 \neq 3 - 2$$

In connection with the above rules, it is well to keep the following facts in mind:

1. Adding a positive number gives a larger value.
2. Subtracting a positive number gives a smaller value.
3. Adding a negative number gives a smaller value.
4. Subtracting a negative number gives a larger value.

**Rules for Multiplication and Division.**—1. The product or quotient of two positive numbers is always a positive number. For instance, in multiplication,  $2 \times 4 = 8$ , and, in division,  $12 \div 3 = 4$ .

2. The product or quotient of two negative numbers is always a positive number. For instance, in multiplication,

$$-2 \times -4 = 8,$$

and, in division,  $-12 \div -3 = 4$ .

3. The product or quotient of a positive and negative number is always a negative number. For instance, in multiplication,  $-2 \times 4 = -8$ , and, in division,  $-12 \div 3 = -4$ .

4. Multiplication can be performed in any order while division must be performed in the order written. For instance, in multiplication,  $2 \times 4 = 4 \times 2 = 8$ , but, in division,

$$12 \div 3 \neq 3 \div 12.$$

5. In a series of different operations, the multiplications are performed first, the divisions second, the additions third, and the subtractions fourth. Terms of a grouping, such as between parentheses, should be solved before performing the operation on the grouping.

**Example 9.** Solve:  $12 \div 3 - 2 \times 9 \div 3 + 10 \times 2 - 2$ .

**Solution.** Performing the multiplications,  $12 \div 3 - 18 \div 3 + 20 - 2$   
 Performing the divisions,  $4 - 6 + 20 - 2$   
 Performing the additions,  $24 - 6 - 2$   
 Performing the subtractions,  $16$  *Ans.*

**Example 10.** Solve:  $[(2 \times 6) - (5 - 8)] \div (3 + 2)$ .

**Solution.** Performing the operations within the parenthesis groupings,  
 $[(12) - (-3)] \div (5)$   
 Combining terms in the bracket,  $15 \div 5$   
 Performing the division,  $3$  *Ans.*

**Cancellation.**—Cancellation is a process used to shorten mathematical problems involving a series of multiplications and divisions. The following are rules for cancellation:

1. Any factor below the line can be divided into any factor above the line, or any factor above the line can be divided into any factor below the line.

2. Any factor common to factors of a term above and factors of a term below the line can be divided into each.

3. After canceling all factors possible, the answer is obtained by dividing the product of all the factors above the line by the product of all the factors below the line.

*Example 11.* Solve  $\frac{5 \times 3 \times 16 \times 8}{15 \times 8 \times 4 \times 3}$ .

*Solution.* Divide 5 into 15, 8 into 16, and 4 into 8, thus

$$\frac{\overset{2}{\cancel{5}} \times 3 \times \overset{2}{\cancel{16}} \times \overset{2}{\cancel{8}}}{\underset{3}{\cancel{15}} \times \cancel{8} \times \cancel{4} \times 3} = \frac{3 \times 2 \times 2}{3 \times 3}$$

Divide 3 into the 3 in the numerator and the 3 in the denominator, and, after multiplying the resulting terms in the numerator, perform the division to obtain

$$\frac{\overset{1}{\cancel{3}} \times 2 \times 2}{\underset{1}{\cancel{3}} \times \cancel{3}} = \frac{2 \times 2}{3} = \frac{4}{3} = 1 \frac{1}{3} \quad \text{Ans.}$$

With a little practice all the operations can be done without rewriting the fraction.

**Fractions.**—Fractions are valuable to represent numbers between consecutive whole numbers or a certain portion of a whole number. A fraction is an indicated division with the denominator below the line representing the number of equal parts into which the whole number is divided and the numerator above the line representing the number of these equally divided parts to be taken. A fraction that has a numerator smaller than the denominator is called a “proper fraction,” while a fraction that has a numerator equal to or greater than the denominator is called an “improper fraction.” A proper fraction, therefore, is less than 1 and an improper fraction is equal to or greater than 1. Equivalent fractions are fractions that have the same value.

If a whole number is associated with a fraction, the number is called a “mixed number.” The answer to Example 11 is a mixed number and means  $1 + \frac{1}{3}$ . A mixed number can be converted into an improper fraction by multiplying the whole number by the denominator of the fraction and adding this number to the numerator, thus

$$1 + \frac{1}{3} = \frac{3 \times 1 + 1}{3} = \frac{3 + 1}{3} = \frac{4}{3} \text{ Ans.}$$

The following are some useful principles for fractions:

1. If the numerator and denominator are multiplied or divided by the same number, the value of the fraction does not change. Thus

$$\frac{6 \times 2}{8 \times 2} = \frac{12}{16} = \frac{6}{8} = \frac{3}{4} \text{ Ans.}$$

or 
$$\frac{\frac{6}{2}}{\frac{8}{2}} = \frac{3}{4} \text{ Check.}$$

2. If the numerator is multiplied by a number, or the denominator is divided by it, the fraction is multiplied by the number. Thus

$$\frac{6}{8} \times 2 = \frac{6 \times 2}{8} = \frac{12}{8} = \frac{3}{2} = 1\frac{1}{2} \text{ Ans.}$$

or 
$$\frac{6}{8} \times 2 = \frac{6}{\frac{8}{2}} = \frac{6}{4} = \frac{3}{2} = 1\frac{1}{2} \text{ Check.}$$

3. If the numerator is divided by a number, or the denominator is multiplied by it, the fraction is divided by the number.

$$\frac{6}{8} \div 2 = \frac{\frac{6}{2}}{8} = \frac{3}{8} \text{ Ans.}$$

or 
$$\frac{6}{8} \div 2 = \frac{6}{8 \times 2} = \frac{6}{16} = \frac{3}{8} \text{ Check.}$$

4. To add fractions, first, convert all the fractions to the same denominator; second, add all the numerators, and third, place this sum over the denominator. Thus

$$\frac{1}{7} + \frac{1}{3} + \frac{1}{2} = \frac{6}{42} + \frac{14}{42} + \frac{21}{42} = \frac{41}{42} \text{ Ans.}$$

Since 42 is the smallest denominator that can be used for these fractions, it is called the "L.C.D." (the least common denominator).

5. To subtract one fraction from another, first convert both fractions to the same denominator; second, subtract one numerator from the other numerator; and third, place the

remainder over the denominator. Thus

$$\frac{1}{5} - \frac{1}{6} = \frac{6}{30} - \frac{5}{30} = \frac{1}{30} \quad \text{Ans.}$$

6. To multiply fractions, multiply the numerators together for the new numerator and the denominators together for the new denominator. Thus

$$\frac{2}{3} \times \frac{3}{5} = \frac{2 \times 3}{3 \times 5} = \frac{2}{5} \quad \text{Ans.}$$

7. To divide fractions or to simplify complex fractions, invert the divisor and multiply, thus

$$\frac{\frac{2}{3}}{\frac{3}{5}} = \frac{2}{3} \div \frac{3}{5} = \frac{2}{3} \times \frac{5}{3} = \frac{10}{9} = 1 \frac{1}{9} \quad \text{Ans.}$$

The *reciprocal* of a number is the fraction that has the number as the denominator and 1 as the numerator. Thus, the reciprocal of 3 is  $\frac{1}{3}$ . The reciprocal of a fraction is 1 over the fraction, or the fraction inverted, thus

$$\text{The reciprocal of } \frac{2}{3} \text{ is } \frac{1}{\frac{2}{3}} = \frac{1}{1} \div \frac{2}{3} = \frac{1}{1} \times \frac{3}{2} = \frac{3}{2} \quad \text{Ans.}$$

The sign of a fraction depends upon three signs, (1) the sign in front of the fraction, (2) the sign of the numerator, and (3) the sign of the denominator. The sign of the fraction is positive if the product of these three signs is positive and the sign of the fraction is negative if the product of these three signs is negative. Thus, for a positive fraction,

$$+ \frac{+3}{+5} = + \frac{-3}{-5} = - \frac{+3}{-5} = - \frac{-3}{+5}$$

$$+ = (+)(+)(+) = (+)(-)(-) = (-)(+)(-) = (-)(-)(+)$$

and for a negative fraction,

$$- \frac{-3}{-5} = - \frac{+3}{+5} = + \frac{-3}{+5} = + \frac{+3}{-5}$$

$$(-) = (-)(-)(-) = (-)(+)(+) = (+)(-)(+) = (+)(+)(-)$$

**Decimal Fractions.**—Decimal fractions have denominators that are multiples of 10. Thus,  $\frac{2}{10}$ ,  $\frac{47}{100}$ , and  $\frac{63}{1000}$  are

decimal fractions. For convenience, they can be written omitting the denominator if a decimal point is placed in the numerator so that there will be as many digits to the right of the decimal point as there are zeros in the denominator, thus

$$\frac{2}{10} = 0.2, \quad \frac{47}{100} = 0.47, \quad \frac{63}{1,000} = 0.063$$

The zero is written at the left of the decimal point for clearness. This is not necessary but is a very good practice to follow. When there are fewer figures in the numerator than there are zeros in the denominator, zeros are added to the left of the number figures to make the required number of digits.

Every time the decimal point is moved one place, the number changes by 10 times its value. If the decimal point is moved to the right, the number increases; if it is moved to the left, it decreases. The relative value of the digits on either side of the decimal point is illustrated in the following table:

TABLE 1.—RELATIVE VALUE OF DIGITS ON EITHER SIDE OF THE DECIMAL POINT

1,000,000,000.	Billions
100,000,000.	Hundreds of millions
10,000,000.	Tens of millions
1,000,000.	Millions
100,000.	Hundreds of thousands
10,000.	Tens of thousands
1,000.	Thousands
100.	Hundreds
10.	Tens
1.	Units
0.1	Tenths
0.01	Hundredths
0.001	Thousandths
0.0001	Ten thousandths
0.00001	Hundred thousandths
0.000001	Millionths
0.0000001	Ten millionths
0.00000001	Hundred millionths
0.000000001	Billionths

Engineers usually simplify the reading of decimal numbers. Instead of reading 342.79 as "three hundred and forty-two and seventy-nine one-hundredths," they usually read it "three, four, two, point, seven, nine." Another common practice is to

express small numbers less than unity up to hundredths in per cent of unity by moving the decimal point to the right two digits, thus, 0.79 may be written 79 per cent of unity.

**Exponents.**—The exponent of a number is a small figure placed to the right and above the number and means that the number is to be taken that many times as a factor, hence the square of the number 10 is

$$10^2 = 10 \times 10 = 100$$

Similarly,  $10^3 = 10 \times 10 \times 10 = 1,000$

$10^3$  is read "10 cube," or "10 raised to the third power." When no exponent is written, it is understood to be 1; hence,  $10^1 = 10$ . Positive exponents give results greater than unity, if the number raised to the power is greater than unity.

A number raised to a negative power is equivalent to the reciprocal of the number (1 over the number) raised to a positive power, hence

$$10^{-3} = \frac{1}{10^3} = \frac{1}{10} \times \frac{1}{10} \times \frac{1}{10} = 0.1 \times 0.1 \times 0.1 = \frac{1}{1,000} = 0.001$$

Negative exponents give results between zero and unity when the number raised to the negative power is greater than unity.

Since positive exponents are for results greater than unity and negative exponents are for results less than unity, the system can be made complete if the exponent zero always gives unity. Hence, any number raised to the zero power is defined to be unity; thus,  $10^0 = 1$ .

In order to state general laws for exponents, it is convenient to substitute letters for the numbers as is done in algebra, thus

$$A^n = (A \text{ multiplied by itself } n \text{ times})$$

Hence, when  $n = 4$ , we have  $A^4 = A \cdot A \cdot A \cdot A$ . Using this notation, we can write the following laws of exponents:

1. *Addition of Exponents.*

$$A^m A^n = A^{m+n} \quad (2)$$

This means that ( $A$  multiplied by itself  $m$  times) ( $A$  multiplied by itself  $n$  times) = ( $A$  multiplied by itself  $m + n$  times).

*Example 12.*  $2^3 \times 2^4 = 2^{3+4} = 2^7$ . *Ans.*

*Example 13.*  $6^{-2} \times 6^4 \times 6^{-8} \times 6^{-6} = 6^{-13}$ . *Ans.*

## ARITHMETIC

It should be noted that this law is for like numbers raised the same or different powers. If unlike numbers are raised powers, it is necessary to raise the respective numbers to 1 power of their respective exponent before multiplying.

*Example 14.*  $4^2 \times 2^3 = 4 \times 4 \times 2 \times 2 \times 2 = 16 \times 8 = 128.$  *Ans.*

### 2. Subtraction of Exponents.

$$\frac{A^m}{A^n} = A^{m-n} = \frac{1}{A^{n-m}}$$

when  $m = n$ ;  $\frac{A^n}{A^n} = A^{n-n} = A^0 = \frac{1}{A^0} = 1.$

*Example 15.*  $\frac{2^3}{2^2} = 2^{3-2} = 2^1 = 2.$  *Ans.*

*Example 16.*  $\frac{11^6}{11^{-7}} = 11^6 \times 11^7 = 11^{13}.$  *Ans.*

*Example 17.*  $\frac{5^4}{5^6} = \frac{1}{5^6 \times 5^{-4}} = \frac{1}{5^2} = 5^{-2}.$  *Ans.*

These examples show that a number in the numerator can be moved to the denominator if the sign of the exponent is changed. Likewise, a number in the denominator can be moved to numerator if the sign of the exponent is changed.

3. *Multiplication of Exponents.* To find the power of a power we multiply the exponents, thus

$$(A^m)^n = A^{mn}$$

*Example 18.*  $(3^5)^2 = 3^5 \times 3^5 \times 3^5 = 3^{15}.$  *Ans.*

*Example 19.*  $(2^{-3})^{-4} = 2^{12}.$  *Ans.*

*Example 20.*  $(4^{-4})^2 = 4^{-8}.$  *Ans.*

*Example 21.*  $(6^2)^{-7} = 6^{-14}.$  *Ans.*

4. *Power of a Product.* The power of a product can be written as the product of the various factors raised to that power, thus

$$(ABC \dots)^n = A^n B^n C^n \dots$$

*Example 22.*  $(3 \cdot 4 \cdot 5)^2 = 3^2 \cdot 4^2 \cdot 5^2 = 3600.$  *Ans.*

5. *Power of a Fraction.* The power of a fraction can be written as the power of the numerator divided by the power of the denominator, thus

$$\left(\frac{A}{B}\right)^n = \frac{A^n}{B^n}$$

*Example 23.*  $\left(\frac{3}{4}\right)^2 = \frac{3^2}{4^2} = \frac{9}{16}$  *Ans.*

**Scientific Notation.**—Any number can be expressed by scientific notation if it is written as a decimal number between 1 and 10 multiplied by 10 raised to the proper exponent. The use of scientific notation materially simplifies the writing of many numbers used in electrical engineering. It is recommended that the student use scientific notation wherever it will simplify the numbers.

*Example 24.* Write the following numbers in scientific notation:

$$\begin{aligned} 6,000,000 &= 6 \times 10^6 \text{ Ans.} \\ 0.000\ 000\ 34 &= 3.4 \times 10^{-7} \text{ Ans.} \end{aligned}$$

This example shows that the decimal point can be shifted as many places as necessary if the new quantity, or answer, is multiplied by 10 raised to a power equal to the number of places the decimal point is shifted. The power of 10 in the answer is positive if the decimal point is moved to the left and negative if the decimal point is moved to the right.

*Example 25.* Simplify the following fraction and express the answer in scientific notation:

$$\begin{aligned} \frac{4.000 \times 5 \times 10^{-12} \times 2 \times 10^6}{0.0000005 \times 4 \times 10^{16}} &= \frac{4 \times 5 \times 2 \times 10^{3-12+6}}{5 \times 4 \times 10^{16-7}} \\ &= \frac{2 \times 10^{-3}}{10^9} = 2 \times 10^{-3-9} = 2 \times 10^{-12} \text{ Ans.} \end{aligned}$$

**Conversion of Units.**—In radio and communication engineering some quantities would be very small or very large if expressed in common units. The usual practice, therefore, is to use units that can be expressed in quantities of convenient size. For instance, a convenient expression for capacity is micromicrofarad, which is one-millionth of a millionth part of a farad, that is

$$1\mu\mu\text{f} = 0.000000000001 \text{ farad} = 10^{-12}\text{f} \text{ or } 10^{-12} \text{ farad}$$

Here the Greek letter  $\mu$  means “micro” and f means “farad.” Likewise, one microfarad is one-millionth of a farad and is expressed

$$1\mu\text{f} = 0.000001 \text{ farad} = 10^{-6}\text{f} \text{ or } 10^{-6} \text{ farad}$$

the term millifarad is rarely used. The abbreviation mfd is used

quite commonly on typewriters not having  $\mu$  and even in printed matter to stand for microfarad.

Inductance values in radio and communication engineering are usually expressed in micromicrohenrys ( $\mu\mu h$ ), microhenrys ( $\mu h$ ), or millihenrys ( $mh$ ). One millihenry is one thousandth of a henry, that is

$$1 \text{ mh} = 0.001h = 10^{-3}h$$

Resistance values are usually larger than unity and may be very large.  $k\Omega$  is often used for kilohms, meaning "thousands of ohms," while  $M\Omega$  is used for megohms, meaning "millions of ohms."

High voltage or wattage is ordinarily expressed as kilovolt ( $kv$ ) or kilowatt ( $kw$ ). A kilovolt or kilowatt is one thousand times greater than the volt or watt.

When changing from one size of unit to another, the conversion table on page 243 is very convenient to use. The table on page 239 gives other useful quantitative electrical abbreviations.

**Radicals.**—If a quantity is divided into  $n$  equal factors, then one of the factors is said to be the  $n^{\text{th}}$  root of the quantity. In other words,

$$(A^{\frac{1}{n}} \text{ multiplied by itself } n \text{ times}) = A \quad (7)$$

The  $n^{\text{th}}$  root of the quantity  $A$  can be written as a fractional exponent or as the  $n^{\text{th}}$  root of the radical  $A$ , thus

$$A^{\frac{1}{n}} = \sqrt[n]{A} \quad (8)$$

*Example 26.*  $9^{\frac{1}{2}} = \sqrt[2]{9} = 3. \text{ Ans.}$

In Eq. (8),  $A = 9$ ,  $n = 2$ ; hence, by Eq. (7),

$$(9^{\frac{1}{2}} \times 9^{\frac{1}{2}}) = 9^{\frac{1+1}{2}} = 9 \quad \text{or} \quad 3 \times 3 = 9.$$

When expressing square root, the 2 is usually omitted; hence

$$\sqrt[2]{\phantom{x}} = \sqrt{\phantom{x}} \quad (9)$$

but for other roots it must be indicated.

The number under the radical sign is called the "radicand."

If a quantity is to have a root extracted and also be raised to a power, the following general form is applicable:

$$A^{\frac{m}{n}} = \sqrt[n]{A^m} \quad (10)$$

The numerator of the exponent indicates the power and the denominator of the exponent indicates the root.

*Example 27.*  $A^{\frac{m}{n}} = 8^{\frac{2}{3}} = \sqrt[3]{8^2} = \sqrt[3]{64} = 4 = (\sqrt[3]{8})^2 = 2^2 = 4. \quad \text{Ans}$

**Square Root of Numbers.**—The extraction of the square root is a relatively simple process but that of higher roots is more complicated and calls for the use of logarithms. If the number is expressed in scientific notation, the root can be taken directly providing the exponent of 10 is even. However, if the exponent is odd the decimal point must be shifted one digit. When the exponent of 10 is even, the root of this part of the number is 10 raised to one half the value of the original exponent. If the exponent of 10 is odd, it cannot be divided by 2 to get a whole number. This is the reason for shifting the decimal point.

*Example 28.*  $\sqrt{1.44 \times 10^4} = \sqrt{1.44} \times \sqrt{10^4} = 1.2 \times 10^2. \quad \text{Ans.}$

*Example 29.*  $\sqrt{6.4 \times 10^3} = \sqrt{64 \times 10^2} = \sqrt{64} \sqrt{10^2} = 8 \times 10. \quad \text{Ans.}$

The extraction of the square root of a whole number will be explained in the following example:

*Example 30.* Extract the square root of 69,573.

*Step 1.* Start at the decimal point and divide the number into groups of two, thus

$$6'95'73'$$

*Step 2.* Find the largest squared number that will be less than the first group. In this case 2 square gives 4, which is the largest squared number less than 6. Place this 2 to the right as shown and subtract the square of this number from the first group, thus

$$\begin{array}{r} 6'95'73'/2 \\ 4 \\ \hline 2 \end{array}$$

*Step 3.* The second group is brought down with the remainder, in this case giving 295.

*Step 4.* The number in the answer is doubled and brought down as a trial divisor.

*Step 5.* Another number is added to this trial divisor. This number is so selected that the product of it by the trial divisor will be the largest number that will go into the remainder, thus

$$\begin{array}{r} 6'95'73' \underline{26} \\ 4 \\ \underline{46} \overline{295} \\ 276 \\ \underline{\phantom{00}19} \end{array}$$

*Step 6.* The process is now repeated, that is, the next group of figures is brought down with the remainder, the answer is doubled and one figure added to it of such a value that the product of the two numbers will be the largest number that will go into the remainder, thus

$$\begin{array}{r} 6'95'73' \underline{263} \\ 4 \\ \underline{46} \overline{295} \\ 276 \\ \underline{523} \overline{1973} \\ 1569 \\ \underline{\phantom{00}404} \end{array}$$

The answer for this problem is 263 with a remainder of 404. If more accuracy is desired, it can be obtained by bringing down two ciphers and repeating the above process. *Ans.*

In the above example we had a whole number, but the process would not be changed if we had a decimal quantity to deal with. It is only necessary to keep in mind that the number must be pointed off in groups of two, starting at the decimal point. Examples of pointing off are

$$43'97'32'98'73 \quad 0.00'07'56 \quad 0.78'03$$

The student should work a considerable number of these problems to become familiar with the procedure.

### Exercises

1. Add: 119, -34, 23, 56, -90, -43.
2. Add: -78, 89, 64, -34, 20, -85.
3. Add: 97, 44, -63, -56, -89.
4. Add: 45, -70, -54, 34, 24, -89, 865.
5. Subtract (-78, 87, -43) from -98.
6. Subtract (34, 67, -91, -52) from (45, -19, -65, -78).
7. Subtract -89 from (13, -76).
8. Multiply:  $18 \times -5 \times 6 \times -13$ .

9. Solve  $\frac{18 \times 10^3}{6 \times 10^2}$ .

10. Solve  $\frac{8 \times -6 \times 10^{-11} \times 10^{-4}}{-4 \times 10^{16} \times 3^2}$ .

11. Solve  $\frac{6^{10} \times 6^{-9} \times 6^{-18}}{6^{54} \times 6^{-45}}$ .

12. Express the following in scientific notation: 987,000; 76.456; 0.0007; 9,000.00; 8.976.500.01; 12,000.000.000.000.000.000.

13. Solve  $\frac{0.0000006 \times 10^6 \times 100,000.00}{0.48 \times 10^{-1} \times 0.0000004}$ .

14. Express each of the following in units, micro units and in micromicro units: 0.0000009 farad; 1,000 mh;  $6\mu\text{f}$ ;  $67\mu\mu\text{f}$ ;  $104\mu\text{h}$ ;  $0.0003\mu\text{f}$ ;  $0.1\mu\text{f}$ ; 0.008 farad.

15. Find the square root of the following numbers: 889,635; 9,976; 9,940.09; 5.890331; 0.0000000009; 0.00047; 0.004978.

## CHAPTER 2

### LOGARITHMS

Where four or more significant figures are required, logarithms may be used to advantage in all computations except addition and subtraction. Every engineer should be proficient in their use; hence the following notes and definitions are given to refresh the memory.<sup>1</sup>

A *Logarithm* is an exponent; therefore the same laws apply to logarithms as to exponents in general. This statement must be qualified slightly, because the base must be positive and other than 1.

To a person who thoroughly understand exponents, logarithms should be very easy to understand. Common logarithms are based upon the use of 10 raised to positive and negative powers. In Chap. 1, 10 was raised to positive and negative powers. This chapter goes one step further and introduces decimal powers. A table of logarithms is merely the systematic arrangement of the value of 10 raised to decimal powers. The base of common logarithms is 10.

$$\left. \begin{array}{l} \text{The } \textit{logarithm} \\ \text{of } \textit{any} \text{ number} \\ \text{to the base 10} \end{array} \right\} = \left\{ \begin{array}{l} \text{the power to which} \\ 10 \text{ must be raised to} \\ \text{produce the number} \end{array} \right.$$

This may sound complicated, but it is really quite simple; for instance,  $100 = 10^2$ . Now the logarithm of 100 to the base 10 is 2, the power to which 10 must be raised to produce 100. Consider another illustration which is more general,

$$10^{2.457882} = 287$$

<sup>1</sup> Certain portions of this chapter have been taken with permission from Dana and Willmarth, "Engineering Problems Manual," published and copyrighted by McGraw-Hill Book Company, Inc., New York.

This equation says that the logarithm of 287 is written

$$\log 287 = 2.457882,$$

which means that 10 must be raised to the 2.457882 power to produce 287; this was obtained from the logarithm tables.

If 10 is raised to the third power, the result is 1,000. From this it is seen that the logarithm of any number between 100 and 1,000 will be a decimal number between 2 and 3. If 10 is raised to the first power, the answer is 10, so that  $\log 10 = 1$ , and the logarithm of any number from 10 to 100 will be decimal numbers between 1 and 2.

$10^0 = 1$ ; *not* 0, which is a common mistake. This says in terms of logarithms that  $\log 1 = 0$ , so numbers between 1 and 10 have logarithms between 0 and 1.

The discussion so far has dealt with positive exponents of 10. That is, all numbers greater than 1 have positive logarithms.

Now consider  $10^{-1}$ . From the theory of exponents this can be written  $10^{-1} = 1/10^1 = 0.1$ . This says that  $\log 0.1 = -1$ . Likewise,  $10^{-2} = 1/10^2 = 0.01$ , or  $\log 0.01 = -2$ . A more general case is  $10^{-1+.551450} = 0.356$ , or  $\log 0.356 = -1+.551450$ . This was taken from the logarithm table. It is seen from the above illustrations that any number between 0.1 and 1 will have a logarithm of  $-1+$ . decimal. Between 0.01 and 0.1 the logarithm will be  $-2+$ . decimal; between 0.001 and 0.01 the logarithm will be  $-3+$ . decimal.

The logarithm of a number is made up of two parts; a decimal, called the "mantissa," and a whole number (which may be positive, negative, or zero), called the "characteristic."

The *mantissa* determines the sequence of digits, and is all that is given in logarithm tables. It is always positive.

The *characteristic* determines the position of the decimal point.

Consider the illustration given above,  $\log 287 = 2.457882$ . Here 2 is the characteristic and 0.457882 is the mantissa. In the other illustration  $\log 0.356 = -1+.551450$  where  $-1$  is the characteristic and  $+.551450$  is the mantissa.

The following simple computations may serve to clear up some confusion regarding the meaning of logarithms and the characteristic numbers:

Base Raised to Exponent = Number	Logarithm of Number = Exponent
$(10)^3 = 1,000$	$\log 1,000 = 3.000$
$(10)^2 = 100$	$\log 100 = 2.000$
$(10)^1 = 10$	$\log 10 = 1.000$
$(10)^0 = 1$	$\log 1 = 0.000$
$(10)^{-1} = 1/10^1 = \frac{1}{10} = 0.1$	$\log 0.1 = -1.000$
$(10)^{-2} = 1/10^2 = \frac{1}{100}$ $= 0.01$	$\log 0.01 = -2.000$
$(10)^{-3} = 1/10^3 = 1/1,000$ $= 0.001$	$\log 0.001 = -3.000$

A brief study of this table of logarithms shows that the decimal point shifts as the characteristic changes. To illustrate this,

$$\begin{array}{ll}
 (10)^{0.5} = (10)^{\frac{1}{2}} = \sqrt{10^1} = 3.1623, & \text{or } \log 3.1623 = 0.500 \\
 (10)^{1.5} = (10)^{\frac{3}{2}} = \sqrt{10^3} = 31.623, & \text{or } \log 31.623 = 1.500 \\
 (10)^{2.5} = (10)^{\frac{5}{2}} = \sqrt{10^5} = 316.23, & \text{or } \log 316.23 = 2.500
 \end{array}$$

The characteristic of numbers from 1.0 to 9.99 is 0; from 10 to 99.99, 1; from 100 to 999.99, 2, etc. We can, therefore, make the following simple rule:

#### RULE FOR CHARACTERISTICS

Numbers	Characteristic
One or over.....	One less than the number of digits to the left of the decimal point
Less than one.....	One greater than the number of ciphers between the decimal point and the left-hand digit; negative in sign

The characteristic of a number, written in scientific notation, is *the exponent of 10*. For instance, the characteristic of the number  $8.394 \times 10^9$  is 9. Likewise, the characteristic of the number  $1.743 \times 10^{-3}$  is -3.

It will be noted in the above illustration that 3.1623, 31.623, and 316.23 all have the same mantissa of +0.500 but that the characteristic numbers of the logarithms of these numbers, according to the rule, are 0, 1, and 2, respectively. As the decimal point is shifted, the following result occurs:

Number	Log
316.23	2.500
31.623	1.500
3.1623	0.500
0.31623	-1 + 0.500
0.031623	-2 + 0.500

*Example 1.* Determine the logarithm of 2,873.  
*Solution.* The desired portion of a logarithm table is found below.<sup>1</sup>

N		0	1	2	3	4	5	6	7	8	9	Diff.
285	45	4845										
6		6366										
7		7882	8033	8184	8336	8487	8638	8789	8940	9091	9242	151
8		9392	9543	9694	9845	9995	0146	0296	0447	0597	0748	151
9	46	0898										

The figure 287 is found in the left column under *N* and the figure 3 is found at the head of one of the columns. The mantissa of this number 2873 is then found across from 287 and down from 3, and is 0.458336. Always place a decimal point in front of the mantissa. The zero is placed to the left of the decimal point in front of the mantissa when there is no characteristic or when the characteristic is zero. The characteristic is always determined by inspection. From the rule for characteristics, since the number is greater than 1 the characteristic is 1 less than the number of digits to the left of the decimal point and in this case is 3. Then  $\log 2873 = 3.458336$ . *Ans.*

The characteristic could also have been determined by taking the exponent of 10 when the number was written in scientific notation; thus  $2,873 = 2.873 \times 10^3$ , where the characteristic is 3.

By the above portion of logarithm table another point can be illustrated. It will be noted that the mantissa corresponding to 2,884 is +0.459995 and the one corresponding to the next number 2,885 is +0.460146. There has been a change from 0.459999 to +0.460000 between these two numbers. Now, for convenience of finding this place, there are dashes under the numbers across to this point, and then above the numbers on across. All numbers above this line must use +0.45, while all numbers below this line must affix +0.46.

**Multiplication by Logarithms.**—From Chap. 1 it was learned that to multiply the same numbers raised to various powers it was necessary merely to add their exponents. Since common logarithms are exponents of the same number (in this case, of 10)

<sup>1</sup> Allen's "Six-place Tables," McGraw-Hill Book Company, Inc., New York.

Kashmir University Library  
Acc. No .....145560.....

it is necessary only to add the logarithms of the numbers to multiply them. To find the product after the logarithms have been added, it is necessary to determine the number that has a logarithm equal to this sum. This reverse process is called "taking the antilogarithm." To take an antilogarithm, first look up the mantissa of the logarithm in the logarithm table and find the number that gives it. The characteristic of the logarithm merely tells where to place the decimal point.

*Example 2.* Multiply  $6 \times 48$ .

*Solution.*  $\log 6 = 0.778151$  mantissa from logarithm tables  
 $\log 48 = 1.681241$  characteristic by inspection

Adding,  $\log (6 \times 48) = 2.459392$

Look up the mantissa  $+ 0.459392$  in the logarithm table (this mantissa can be found in the portion of logarithm table given above). The number having this mantissa is 2880. Since 2 is the characteristic, point the number off and get 288.0. *Ans.*

Logarithms are useful in multiplying large numbers, where accuracy to four or five places is sufficient.

*Example 3.* Multiply  $7,864,591 \times 198,642$ .

*Solution.*  $\log 7,864,591 = 6.895644 +$  mantissa from table  
 $\log 198,642 = 5.297979 +$  with characteristic affixed  
 $\log (7,864,591 \times 198,642) = 12.193623 +$   
 $\text{antilog } 12.193623 = 1,562,000,000,000$   
 $= 1.562 \times 10^{12}$  *Ans.*

The student should check all these examples to familiarize himself with the method of using the logarithm table. It will be noted in working the above problems that no interpolation was made. When looking up the antilogarithm, the number giving the nearest to the mantissa was used.

Logarithms are useful in multiplying very small numbers, as illustrated in Example 4.

*Example 4.* Multiply  $0.000000946 \times 0.00087$ .

*Solution.*  $\log 0.000000946 = -7 + 0.975891 = 3.975891 - 10$   
 $\log 0.00087 = -4 + 0.939519 = 6.939519 - 10$   
 $\log (0.000000946 \times 0.00087)$   
 $= -11 + 1.915410 = 10.915410 - 20$   
 $= 0.915410 - 10$   
 $\text{antilog } (0.915410 - 10) = 8.2302 \times 10^{-10}$  *Ans.*

It will be noted in this example that instead of using a negative characteristic with the mantissa, it is more desirable to use a

positive characteristic with the smallest available multiple of  $(-10)$  placed on the right-hand side. Since the mantissa is always positive, it is confusing to associate with it a negative characteristic and then always have to remember this detail.

If several numbers are to be multiplied, one addition of their logarithms is sufficient. The antilogarithm of this sum gives their product.

*Example 5.* Multiply  $0.00004871 \times 6497 \times 1.984$ .

*Solution.*  $\log 0.00004871 = 5.687618 - 10$

$\log 6,497 = 3.812713$

$\log 1.984 = 0.297542$

$\hline 9.797873 - 10$

$\text{antilog } (9.797873 - 10) = 0.627875 \text{ Ans.}$

*Raising numbers to higher powers* is accomplished by multiplying the logarithm of the number by the power and taking the antilogarithm.

This operation would be quite a task to multiply out long-hand, but by logarithms it is easily done as follows:

*Example 6.* Find the fifth power of 638, that is,  $638^5$ .

*Solution.*  $\log 638 = 2.804821$

Multiplying by the power  $\frac{5}{\log 638^5 = 14.024105}$

$\text{antilog } 14.024105 = 105,700,000,000,000 = 1.057 \times 10^{14} \text{ Ans.}$

In this example the effect is the same as that of adding the logarithm of 638 five times and then taking the antilogarithm to obtain the fifth power of the number 638.

**Division by Logarithms.**—Division of numbers by logarithms is accomplished by subtracting the logarithm of the divisor from the logarithm of the dividend. The antilogarithm of this remainder is the quotient.

*Example 7.* Divide 8,964 by 479.

*Solution.*  $\log 8,964 = 3.952502$

$\log 479 = 2.680336$

Subtracting,  $\log \frac{8,964}{479} = 1.272166$

$\text{antilog } 1.272166 = 18.71 + \text{the quotient Ans.}$

The plus sign means that the quotient is greater than indicated owing to not interpolating. Interpolation will be discussed later.

*Example 8.* Divide 0.000371 by 791.

$$\begin{array}{rcl} \text{Solution.} & \log 0.000371 & = 6.569374 - 10 \\ & \log 791 & = \underline{2.898176} \end{array}$$

$$\text{Subtracting, } \log \frac{0.000371}{791} = 3.671198 - 10$$

$$\text{antilog } (3.671198 - 10) = 4.69027 \times 10^{-7} \quad \text{Ans.}$$

*Extracting the root of a number* is accomplished by dividing the logarithm of the number by the root and taking the antilogarithm.

*Example 9.* Solve  $\sqrt[3]{976}$ .

$$\text{Solution. } \log 976 = 2.989450$$

Dividing,

$$3 \overline{) 2.989450}$$

$$\log \sqrt[3]{976} = 0.996483$$

$$\text{antilog } 0.996483 = 9.919 \quad \text{Ans.}$$

After the student thoroughly understands the use of positive and negative exponents, logarithms become a convenient tool in solving many problems. Only practice is then needed to make the solution of these problems rapid. Logarithms can be used to save considerable time in multiplying and dividing large numbers and the use of logarithms offers the only practical way to raise numbers to high powers and extract roots larger than 2.

**Interpolation.**—In order to increase the accuracy to more significant figures, beyond the values read directly from the table, resort is made to interpolation. Interpolation is used in many types of work and should be familiar to the student. Interpolation can be used with logarithm tables because the small difference between numbers is approximately proportional to the difference between their logarithms.

A practical illustration of interpolation is to find the capacity of a variable capacitor when set at 53 degrees. Since the capacity at 50 degrees is 278 micromicrofarad and at 55 degrees is 284 micromicrofarad, the capacity change from 50 degrees to 55 degrees is  $284 - 278 = 6$  micromicrofarad or  $\frac{6}{5} = 1.2$  micromicrofarad per degree change of the capacitor dial. Then the capacity for 3 degrees is 3.6 micromicrofarad and is added to the capacity 278 micromicrofarad at 50 degrees to get 281.6 micromicrofarad, the capacity at 53 degrees. This applies only to straight-line variable capacity capacitors.

Applying this principle of interpolation to logarithms, consider the log 78,634. The mantissa of 7863 from the logarithm table is 0.895588, but it is still necessary to obtain the 4 by interpo-

lation. The figure 56 will be found as the "diff" in the right-hand column. At the bottom of the page will be found a table of proportional parts and going across from the "diff" 56 in the left-hand column to the column headed 4. Therefore 22.4 is the proportional part to be added to the above mantissa giving  $\log 78,634 = 4.8956104$ .

Some logarithm tables do not have proportional parts, so in such cases it will have to be figured out each time. Considering the above illustration,

$$\begin{aligned}\log 78,630 &= 4.895588 && \text{(from log tables)} \\ \log 78,634 &= 4.8956104 && \text{(by interpolation)} \\ \log 78,640 &= 4.895644 && \text{(from log tables)}\end{aligned}$$

Here the logarithms of 30 and 40 are given in the last two digits of the number but it is desired to secure the logarithm of 34 in these last two digits. The corresponding mantissas for 30 and 40 are 0.895588 and 0.895644 respectively. The difference between 30 and 40 is 10, while the difference in the corresponding mantissa is 56. This is the way to secure the number in the right-hand column under "diff." Corresponding to 34 take 0.4 of 56, which is 22.4 and is the proportional part worked out at the bottom of the page.<sup>1</sup> The logarithm by interpolation is  $\log 87,634 = 4.8956104$ .

To find the antilogarithm, the above process must be reversed. For illustration, find the antilogarithm of 3.657488. From the logarithm tables,

$$\begin{aligned}\text{antilog } 3.657438 &= 4,544 \\ \text{antilog } 3.657488 &= 4,544.521 && \text{(by interpolation)} \\ \text{antilog } 3.657534 &= 4,545\end{aligned}$$

Subtract 3.657438 from 3.657488, giving 50, the proportional part. The difference in this case, as noted in the right-hand column, is 96. Across from 96 on the next page find under 5, not 50 but 48, the nearest number to 50, so the answer will not be exact. To make it exact, take the ratio

$$\frac{50}{96} = \frac{x}{10}$$

Solving for  $x$ ,

$$x = \frac{500}{96} = 5.21$$

<sup>1</sup> See Allen's "Six-place Tables," McGraw-Hill Book Company, Inc., New York.

Now  $\text{antilog } 3.657488 = 4,544.521$ , while if the 48 from the table was used, the result would be 4,544.5. Ordinarily the accuracy of the proportional parts table is sufficient, but it can be seen that greater accuracy sometimes can be obtained by using exact proportion.

The student with a thorough understanding of exponents should find that what has been presented on logarithms here is sufficient to enable him to handle any ordinary problem in logarithms. However, it may be well to illustrate by example how to handle the characteristic in extracting the root of small numbers.

*Example 10.* Extract the fifth root of 0.0004466.

*Solution.*  $\log 0.0004466 = 6.649919 - 10$

Dividing by 5,  $\log \sqrt[5]{0.0004466} = 1.3299838 - 2$   
 $= 9.3299838 - 10$   
 $\text{antilog } (9.3299838 - 10) = 0.213788 \quad \text{Ans.}$

It should be pointed out that the negative characteristic placed on the right-hand side ( $-10$  in this case) should *always* be divisible by the root to be extracted. This number is usually made 10 for convenience in routine work.

*Example 11.* Extract the fourth root of 0.0004466.

*Solution.*  $\log 0.0004466 = 0.649919 - 4$

Dividing by 4,  $\log \sqrt[4]{0.0004466} = 0.1624797 - 1$   
 $= 9.1624797 - 10$   
 $\text{antilog } (9.1624797 - 10) = 0.145372 \quad \text{Ans.}$

**Operating the Slide Rule.**—The slide rule is a graphic logarithm table. Many users of the instrument do not realize this and as a result are not able to make full use of its possibilities.

To multiply numbers, simply add their logarithms. To do it graphically on the slide rule, add the distances that are marked off proportional to the logarithm. To divide, subtract distance corresponding to the dividend. The resulting distance corresponds to the quotient.

The accuracy of a slide rule depends upon the precision with which it is made. A longer slide rule will give better accuracy than a short one, but the accuracy does not increase in direct proportion to the length of the scale. Common 10-inch slide rules will give an accuracy to three significant figures, and on the lower end of the scale it is possible to estimate to the fourth digit.

**C and D Scales.**—These are the most commonly used scales on the slide rule. An inspection of these scales shows that they start with 1 at the left end, known as “*the initial index*,” and are marked off with consecutive numbers to 10 at the other end, which is marked with 1 and is the “*right-hand, or final, index*.” This is a complete graphic logarithm table giving the mantissa which determines the sequence of digits in the number. The decimal point is determined by the characteristic, just as was explained earlier in this chapter. Usually it can be readily determined by inspection.

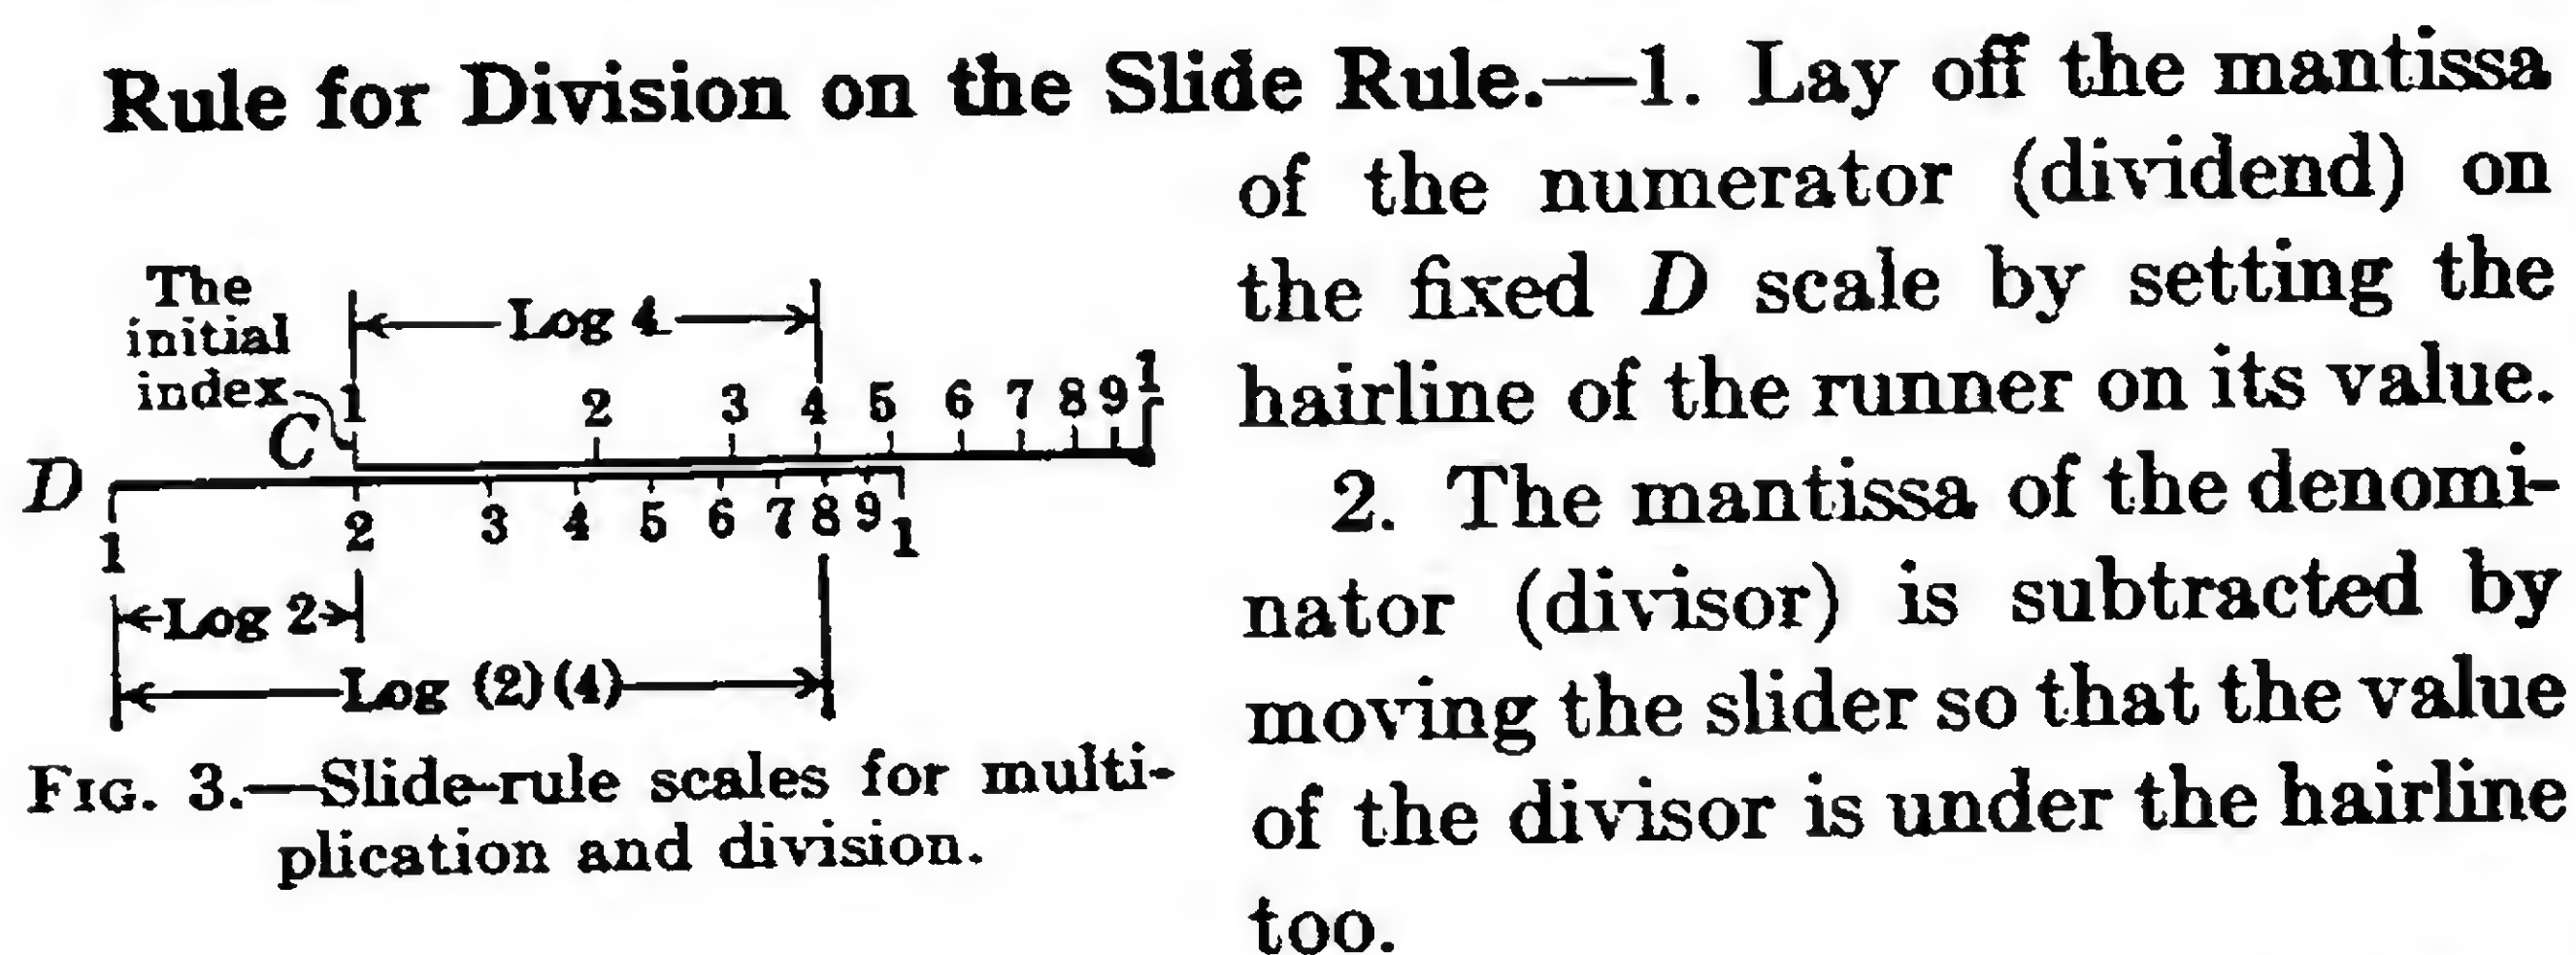

**Rule for Multiplication on the Slide Rule.**—1. Lay off the mantissa of the first number on scale *D* by setting the initial index of scale *C* over the graduation corresponding to the first number.

2. The mantissa of the second number is now added by shifting the runner so that its initial index comes over the graduation corresponding to the second number on scale *C*.

3. The mantissa of the product is the sum of the two distances and the answer is read on scale *D* under the hairline of the runner.

*Example 12.* Multiply  $2 \times 4$  on the slide rule.

*Solution.* The answer 8 is indicated in Fig. 3 by following the above steps.

*Example 13.* Divide 8 by 4 on the slide rule.

*Solution.* Figure 3 also illustrates this problem, which is the reverse of the multiplication. The answer 2 is obtained by following the above steps.

**Square Root Rule.**—If the characteristic of the number is 0 or an even number, then the square root is found under the left portion of scale *A* on scale *D*. Divide the characteristic by 2 and place the decimal point in the square root according to the

result. If the number was originally written in scientific notation, then the exponent of 10 is divided by 2 and the answer is still in scientific notation.

*Example 14.* Find the square root of 97,969.

*Solution.* Since the characteristic 4 of this number is even, place the hairline over 97,969 to the left of the center on scale *A* and read 313 the answer on scale *D*. The characteristic of the answer is 2, just half that of the original number. Actually only the first three digits of the original number can be read on scale *A* of the slide rule.

If the characteristic of the number is an odd number, then the square root is found under the right-hand portion of the *A* scale on the *D* scale. Subtract 1 from the characteristic of the number and divide by 2 to find the characteristic of the root.

*Example 15.* Find the square root of  $1.56816 \times 10^5$ .

*Solution.* Below 1.56816 on the right-hand side of scale *A* find the answer  $3.96 \times 10^2$ . The characteristic 2 was found by subtracting 1 from 5 and dividing by 2.

**Square Rule.**—When the hairline is to the left of the middle of the *A* and *B* scales (roots less than 3.1623), the square of the number on the *D* scale is found on the *A* scale. The characteristic of the squared number is twice that of the original number. If the original number is written in scientific notation, then the answer will also be in scientific notation.

*Example 16.* Square 240.

*Solution.* Above 240 on scale *D* read the answer 57,600 on scale *A*. The characteristic doubled since the answer was on the left-hand side.

When the hairline is to the right of the middle on scale *A* and *B*, the characteristic is found by multiplying the characteristic of the original number by 2 and adding 1. Again, if the original number was in scientific notation, then the answer will also be in scientific notation.

*Example 17.* Square  $6.2 \times 10^3$ .

*Solution.* Above 6.2 on scale *D* read the answer  $3.844 \times 10^7$  on scale *A*. The characteristic 7 was obtained by multiplying 3 by 2 and adding 1.

The student must use the slide rule at every opportunity if he wishes to become familiar with its operation and feel confidence in its results.

**Folded Scales.**—Sometimes when two numbers are being multiplied the second number appears beyond the right-hand index of scale  $D$ . Rather than sliding the other index of scale  $C$  over the first number and reading the answer at the other end, merely read opposite the second number on the  $CF$  scale the answer on the  $DF$  scale. For instance  $2 \times 6$  permits the use of the folded scale to get 12 on scale  $DF$  opposite 6 on scale  $CF$ . This could have been obtained by placing the other index of scale  $C$  over 2 on scale  $D$  and reading the answer 12 on scale  $D$  opposite 6 on scale  $C$ .

It will be of interest to note that the  $CF$  and  $DF$  scales are folded at  $\pi$ , which is 3.1416. This permits the index to fall about the center of the rule and in addition permits rapid calculations which involve  $\pi$ . For instance, a circle has a diameter of 6 inches. What is its circumference? Set the hairline over 6 on scale  $D$  and read the answer ( $6\pi = 18.85$ ) under the hairline on scale  $DF$ . In other words it is not necessary to use the slider.

**Inverted Scales.**—Labor may be saved in many problems through the use of reciprocals. A problem of division may be converted into a problem of multiplication by using the reciprocal of the denominator. (*Note:* The reciprocal of a number is a fraction with 1 over the number.) The  $CI$  and  $CIF$  scales, which are usually printed in red, are reciprocal scales.

**Reciprocal Rule.**—When moving a number from the numerator to the denominator of a fraction, or vice versa, write the reciprocal of the number in the position and change the sign of the characteristic of the number. When the initial index of the inverted scale (the  $CI$  to the right of the final index of  $D$  scale, and the  $CIF$  to the left of the  $DF$  index) projects, subtract 1 from the characteristic of the number causing the index to project.

*Example 18.* Multiply  $6 \times 4 \times 3$ .

*Solution.* Divide 6 on scale  $D$  by 4 on scale  $CI$  (which causes multiplication), then slide hairline to 3 on scale  $C$  and read the answer 72 on scale  $D$ . Since the initial index on the right-hand end of the  $CI$  scale is to the right of the final index on scale  $D$ , 1 must be added to the characteristic.

The student can get along without these inverted scales but if he is interested in short cuts he can read the instruction book with the slide rule for further information.

**A and B Scales.**—The *A* and *B* scales consist of two complete logarithm scales, each half as long as scale *D*. Since the values of the logarithm increase twice as fast on scale *A* as on scale *D*, the means of securing square roots and square powers is provided. Opposite a number on scale *D* the square is found on scale *A*. Conversely, a number on scale *A* will have its square root opposite it on the *D* scale.

**K Scale.**—The *K* scale consists of three complete logarithm scales, each one third as long as scale *D*. The *K* scale gives cubes and cube roots in the same manner as scale *A* gives squares and square roots.

**L Scale.**—This scale is a complete logarithm table. To take the logarithm of a number, place the hairline of the slider over the number on scale *D* and read the mantissa under the hairline on scale *L*.

The following facts are important to keep in mind when using a slide rule:

1. The slide rule is a graphic logarithm table.
2. The mantissa only is determined from any logarithm table, including the slide rule which is a graphic one.
3. The mantissa determines only the sequence of digits.
4. Characteristics are not given in any logarithm tables.
5. The characteristic is determined by inspection. It is the exponent of 10 when the number is written in scientific notation.
6. The characteristic determines the decimal point.

When multiplying very large or very small numbers on the slide rule, it is convenient to use 10 to some power and place the decimal point after the first digit.

*Example 19.* Multiply  $0.00000027 \times 96000$ .  
 Rewrite  $2.7 \times 10^{-7} \times 9.6 \times 10^4$   
 Rewrite and multiply  $2.7 \times 9.6 \times 10^{-3} = 25.92 \times 10^{-3}$  *Ans.*

This makes it easy to keep track of the decimal point by inspection when scientific notation is employed.

**Decimal Point and the Slide Rule.**—The last example illustrates how the decimal point can be easily found by inspection. A definite procedure will now be given for keeping track of the decimal point when using the slide rule.

When using numerical logarithms the characteristic is added to the mantissa, but when using the slide rule this cannot be

done. However, *keeping track of the characteristic* is the easiest way of determining the decimal point when using a slide rule.

When multiplying by means of numerical logarithms the sum of the mantissas is often more than 1.0 and so 1 must be carried over into the column of the characteristics. If this same problem is solved with a slide rule, it is found that there is an *exact parallel* between the numerical and graphic methods. The distances representing the mantissas will add to one full scale length or more. This corresponds to carrying 1 into the characteristic column; hence a note should be made each time this occurs.

There is a simple, quickly applied, and absolutely accurate rule for decimal points based upon the foregoing facts. This method completely does away with the need of longhand check-

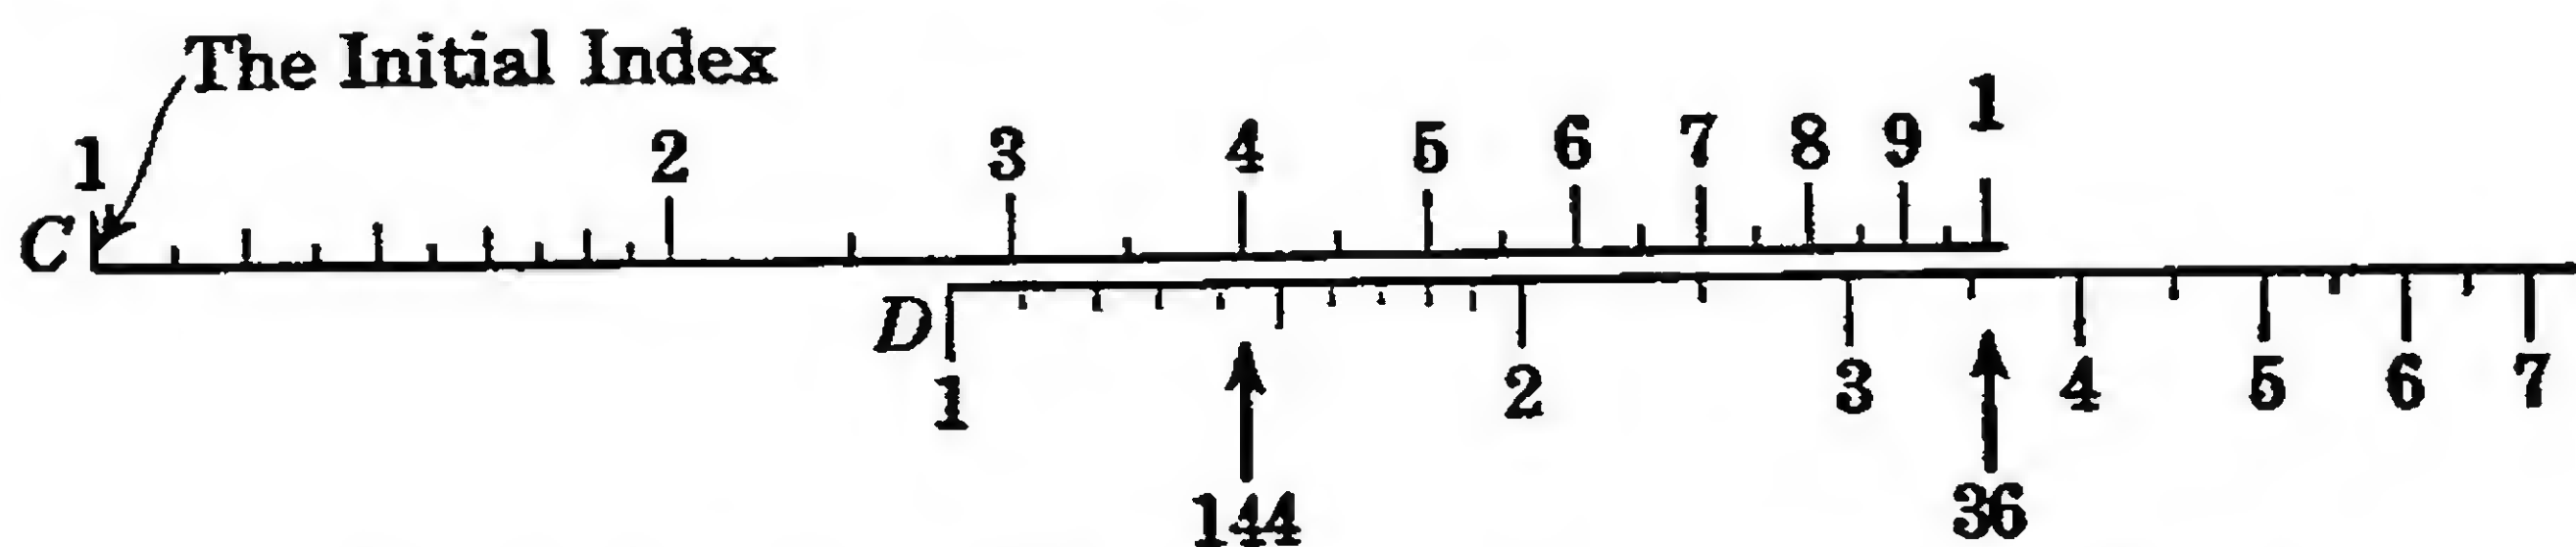

FIG. 4.—Slide-rule scale showing the initial index projecting.

ing, mental shifting of the decimal point, approximate calculations, or any other so-called “system” not based upon logarithms.

**The Initial Index.**—In the following rules for location of the decimal point, reference is made to “*the initial index.*” There are many indexes on a rule; those at the beginning end of any scale are initial indexes, and those at the far end are final indexes. There is one initial index, however, which is so important that it is *the initial index*. When using the *C* and *D* scales, *the initial index is the left end of the C scale* for all operations. The graduations begin at the initial index and have increasing values as the final index is approached.

When the slide is in the position shown in Fig. 4, it is said that *the initial index projects* and *a change must be made in the characteristic*. The initial index never projects unless such a change should be made.

**Rules for Locating the Decimal Point When Using the C and D Scales.**—1. Note the position of *the initial index* as soon as each new term in the problem has been set on the rule

2. If *the* initial index projects, *add* 1 to the logarithmic characteristic of the term which caused the index to project. Thus, for multiplication, add 1 to the logarithmic characteristic of the multiplier which caused the index to project. The characteristic of the answer is the algebraic sum of the characteristics of the terms plus the "added characteristics." For division, add 1 to the logarithmic characteristic of the divisor which caused the index to project. The characteristic of the answer is the algebraic difference of the characteristics of the divisor and dividend.

3. When *the* initial index does not project, make no changes in the characteristics.

4. For continued operations, note the position of the initial index as soon as each new term is set on the rule, and record any necessary addition to the characteristics at once.

**Sequence of Operations.**—While becoming familiar with this method, the beginner should form the habit of going through the following steps in his slide-rule work:

1. Set the work up in a suitable form for a slide-rule computation. (See examples below.)

2. Indicate the logarithmic characteristic of each term somewhere close by. (Just above the multipliers and below the divisors is convenient.)

3. Note the position of the initial index as soon as each new factor is set on the rule.

4. Record the "added characteristic" if the initial index projects.

5. Determine the characteristic of the answer.

### Multiplication.

*Example 20.* Multiply 36 by 0.0004.

1. Set the work up in a suitable form.

2. Indicate the logarithmic characteristic above each multiplier.

$$\begin{array}{rcccccl}
 & & +1 & & & & \\
 +1 & & -4 & +1 & -4 & +1 & = -2 \\
 (36)(0.0004) & = & 0.0144 & = & 1.44 \times 10^{-2} & \text{Ans.}
 \end{array}$$

3. Referring to Fig. 4, it is seen that the initial index projects.

4. Hence 1 must be added to the characteristics.

5. Adding the characteristics gives  $1 - 4 + 1 = -2$  as the characteristic of the answer. The answer is now pointed off according to this characteristic.

**Division.***Example 21.* Divide 0.512 by 800.

1. Set the work up in a suitable form.
2. Indicate the logarithmic characteristic above the dividend and below the divisor.

$$\begin{array}{r} -1 \\ 0.512 \\ \hline 800 \\ +2 \\ +1 \end{array} = \begin{array}{r} -1 \\ -3 \\ -4 \end{array} = 0.00064 = 6.4 \times 10^{-4} \text{ Ans.}$$

3. The initial index projects.
4. Hence 1 must be added to the characteristic of the divisor giving  $2 + 1 = 3$ .
5. The characteristics of the divisor are subtracted from the characteristics of the dividend giving  $-1 - 3 = -4$  as the characteristic of the quotient. The answer is now pointed off according to this characteristic.

**Multiplication and Division.**

$$\text{Example 22. Solve } \frac{\begin{array}{r} -4 \\ (0.0003) \end{array} \begin{array}{r} +3 \\ (1440) \end{array}}{\begin{array}{r} 6.0 \\ 0 \\ +1 \end{array}} = 7.2 \times 10^{-2} \text{ Ans.}$$

Place the characteristics above the respective numbers of the numerator and below the respective numbers of the denominator. Place the hairline over 3 on the *D* scale for the first number of the numerator. Slide the *C* scale until 6 is under the hairline to make the division. Since the initial index projects, add +1 below the 0 of the denominator. Next slide the hairline over 144 on the *C* scale. Since this cannot be done, the initial index is moved to the same point on the *D* scale that the final index was located. Now the hairline can be placed over 144 on the *C* scale. The initial index does not project, so no characteristic is added. The answer is now found on the *D* scale under the hairline and is 72. The characteristic of this answer is obtained by adding those of the numerator and subtracting those of the denominator, thus

$$(-4 + 3) - (0 + 1) = (-1) - (+1) = -2$$

The answer is then 0.072 or  $7.2 \times 10^{-2}$

As another example, let us solve

$$\frac{\begin{array}{r} +2 \\ (256) \end{array} \begin{array}{r} +1 \\ -4 \\ -3 \\ (0.0008)(0.0012) \end{array}}{\begin{array}{r} -3 \\ +1 \end{array} \begin{array}{r} +3 \\ +1 \\ (0.0048)(3200)(96) \end{array}} = 1.666 \times 10^{-7} \text{ Ans.}$$

Place the characteristics above the respective numbers of the numerator and denominator. In this example place the hairline over 256 on the *D*

scale and slide 48 of the *C* scale under the hairline to divide. The initial index projects; hence +1 must be added below the -3. Now slide the hairline to 8 on the *C* scale which is for the next number in the numerator. The initial index projects, so add +1 above -4. Next slide the *C* scale until 32 is under the hairline. This is for the next number in the denominator. Since the initial index does not project, no characteristic is added. Now slide the hairline to 12 on the *C* scale for the next number in the numerator. The initial index does not project, so no characteristic is added. Move the *C* scale until 96, the next number of the denominator, is under the hairline. The initial index projects, so add +1 to the 1 below 96. The final index of the *C* scale is over the answer on the *D* scale and is 1666. The characteristic is obtained by adding those of the numerator and subtracting those of the denominator, thus

$$\begin{aligned}(2 - 4 + 1 - 3) - (-3 + 1 + 3 + 1 + 1) \\ = (-4) - (+3) = -7\end{aligned}$$

The answer is then

$$0.0000001666 \text{ or } 1.666 \times 10^{-7} \text{ Ans.}$$

The following problems are given to be worked on the slide rule, the accuracy of the answer then to be checked by the use of a logarithm table.

Multiply:

- |                            |                                |
|----------------------------|--------------------------------|
| 1. $296 \times 265$        | 9. $462 \times 0.00091$        |
| 2. $197 \times 334$        | 10. $17,900 \times 264,000$    |
| 3. $486 \times 361$        | 11. $0.49000 \times 0.00017$   |
| 4. $87.6 \times 7.12$      | 12. $0.00042 \times 0.0000084$ |
| 5. $1.91 \times 0.629$     | 13. $897,000 \times 0.000063$  |
| 6. $0.0534 \times 0.00617$ | 14. $11,100 \times 99.9$       |
| 7. $967 \times 0.000316$   | 15. $191.00 \times 919,000$    |
| 8. $41,900 \times 264,000$ | 16. $0.00000013 \times 798$    |

In each of the above problems, divide the first number by the second number. Then extract the square root of the second number. Then square the first number. See answers on page 317.

**Suggestions in the Use and Care of the Slide Rule.**—1. *Do not memorize special "trick" settings.* They are of value only in routine work where the same type of computation is used many times.

2. *Use fixed scales to read answers.* The slide is used only for adding or subtracting logarithms. Acquire the correct method and stick to it.

3. For continued operations, involving multiplication and division, *take a zigzag path through the problem.* Divide the

first number in the numerator by the first term in the denominator, then multiply by the second term in the numerator and divide by the second term in the denominator. This will save several settings and lessen chances to error.

4. *Avoid longhand checking*, as confidence cannot be gained in this way. If there are several numbers, take them in a different order as a check.

5. *Keep your slide rule clean* and away from dampness. Wipe off the face with a damp cloth occasionally, but never use alcohol or strong soap, as either of these may remove the markings.

6. *Keep scales and runner properly adjusted* as accurate results depend on this.

#### Exercises

- |   |  |
|---|--|
| 1. $961 \times 378$                               | 11. $\sqrt[4]{7658}$                                       |
| 2. $14.7 \times 7.917$                            | 12. $\sqrt[5]{29341}$                                      |
| 3. $0.00049 \times 7,411$                         | 13. $\sqrt{0.0001392}$                                     |
| 4. $9,376 \times 1,375 \times 0.0006134$          | 14. $\sqrt[3]{0.0027965}$                                  |

## CHAPTER 3

### ALGEBRA

We must study the fundamentals of algebra if we are to get anywhere with radio and communication principles. This review of algebra will consider only the fundamental principles met in everyday engineering work. Nearly all radio engineering involves algebra in some form. Enough of the subject will be treated here to enable the student to handle circuit theory and vacuum tube operation. The work presented will be as simple as ordinary arithmetic and should not baffle any student desiring to take the subject.

In this book algebra will be used to show derivations of useful radio equations. By this means, the student should be better prepared to use such equations than if he were simply given them to memorize. Equations can often be rearranged and solved for a desired term.

In arithmetic figures are used in equations, while in algebra letters are used in order to express more general conditions.

For instance, in algebra we can write Ohm's law by the expression

$$E = IR \quad (1)$$

By simple algebra this same law can be written in the fractional equations

$$I = \frac{E}{R} \quad (2)$$

$$R = \frac{E}{I} \quad (3)$$

In some problems one expression will be more desirable than the others.

When studying tuned circuits, we deal algebraically with  $X_L = X_C$ , where  $X_L$  is the inductive reactance and  $X_C$  is the capacitive reactance. The following equation is true for resonance no matter what the numerical values happen to be. It is

$$f = \frac{1}{2\pi \sqrt{LC}} \quad (4)$$

This is the familiar equation used to determine the frequency of resonance. If we know the inductance  $L$  and the capacity  $C$ , we can determine  $f$ , the frequency at which the circuit will freely oscillate.

**Equations.**—We have so far cited several equations, which are merely expressions of equality between two quantities. This equality is denoted by  $(=)$ , the sign of equality. In Ohm's law  $E = IR$  states that the voltage  $E$  has the same numerical value as the current multiplied by the resistance. *An equation is an expression having the same value on both sides of the sign of equality.* If this is not true, we do not have an equation but an inequality. *The value of one side of an equation may be changed or varied if the other side is changed the same amount.* Such quantities are called "variables." In this case we are changing the numerical value on both sides but maintaining equality; hence, we still have an equation. We can apply multiplication, division, addition, or subtraction to one side of the equation if we do the same thing to the other side.

#### *Illustration of Addition.*

$$\begin{array}{ll} \text{Given} & x + y = z \\ \text{Then} & 1 + x + y = 1 + z \end{array}$$

If  $x = 4$ ,  $y = 3$ , and  $z = 7$ , the above equations read respectively, "Each side is equal to 7, or  $(4 + 3 = 7)$ ," and, "Each side is equal to 8 or  $(1 + 4 + 3 = 1 + 7)$ ."

#### *Illustration of Subtraction.*

$$\begin{array}{ll} \text{Given} & x + y - 3 = z - 3 \\ \text{Substituting values} & 4 + 3 - 3 = 7 - 3 \\ \text{Each side is equal to} & 4. \end{array}$$

#### *Illustration of Multiplication.*

$$\begin{array}{ll} \text{Given} & 2(x + y) = (z)2 \\ \text{Substituting values,} & 2(4 + 3) = 7 \times 2 \\ \text{Each side is equal to} & 14. \end{array}$$

*Illustration of Division.*

Given  $\frac{x + y}{7} = \frac{z}{7}$

Substituting values,  $\frac{4 + 3}{7} = \frac{7}{7}$

Each side is equal to 1.

We see from these illustrations that if an operation is performed on one side, it must also be performed on the other, or the equality of the equation will be destroyed.

Equations usually can be written in several forms and still maintain equality. This often permits us to simplify a complicated expression. Before going farther we must learn how to write algebraic expressions properly.

**Addition.**—We may add *like* terms if we prefix the common term with the number of terms added.

*Illustrations.*

$$x + x = 2x$$

$$ab + ab + ab = 3ab$$

$$\frac{n}{m} + \frac{n}{m} = 2\frac{n}{m}$$

$$(a - b) + (a - b) + (a - b) = 3(a - b)$$

When no number is prefixed it is understood to be 1 of that quantity; thus,  $P$  means  $1P$ .

*Unlike* terms must be written out, thus

$$x + y + z$$

and cannot be simplified.

**Subtraction.**—We may subtract *like* terms if we prefix the common term to the remainder obtained.

*Illustrations.*

$$4a - a = 3a$$

$$9xy - 7xy = 2xy$$

$$\frac{m}{n} - \frac{8m}{n} = -\frac{7m}{n}$$

In the last illustration we have to subtract 8 from 1 which leaves  $-7$ .

*Unlike* terms cannot be handled this way. They must be written out; thus,  $4x - y$  cannot be simplified. However, the

expression can be rearranged, giving  $-y + 4x$ , without changing its value.

Positive and negative number rules, as already given, will always hold true in algebra. What is called "algebraic addition" takes into account all signs and may in some cases actually involve subtraction.

As an illustration, the impedance of a circuit can be expressed

$$Z^2 = R^2 + X^2 \quad (5)$$

where  $R$  is the resistance,  $X$  is the reactance, and  $Z$  is the impedance. Extracting the square root of both sides, we get

$$Z = \sqrt{R^2 + X^2} \quad (6)$$

In this form we can solve for the impedance, while in the original equation we had to deal with the square of the impedance.

If this circuit contained inductive reactance,  $X_L$ , and capacitive reactance  $X_C$ , this expression can be written

$$Z = \sqrt{R^2 + (X_L - X_C)^2} \quad (7)$$

In this case the capacitive reactance must be subtracted from the inductive reactance and then the quantity squared before being added to the square of the resistance to obtain the square of the impedance.

We see that the algebraic language in the above equation is very clear and simple in comparison with the expression of the relationship in a sentence. The exact and simple statement of relationships is one of the main objectives in mathematics.

**Multiplication.**—We may multiply *like* terms by raising the like term to the power corresponding to the number of terms multiplied.

*Illustrations.*

$$\begin{aligned} N \times N \times N &= N^3 \\ ab \times ab &= (ab)^2 \end{aligned}$$

We may indicate the multiplication of *unlike* terms by simply writing the terms to be multiplied in succession with no sign between terms.

*Illustrations.*—To multiply  $I$ , the current, by  $R$ , the resistance, to obtain the voltage,  $E$ , we write

$$E = IR$$

As another illustration, for resonance,

$$X_L = X_C$$

but  $X_L = \omega L$ , where  $\omega$  is the angular velocity in radians per second and  $L$  is the inductance in henrys, and  $X_C = 1/\omega C$  where  $C$  is the capacity in farads. Since things equal to the same thing are equal to each other, we can write

$$\omega L = \frac{1}{\omega C}$$

or, multiplying both sides of the equation by  $\omega$ , we get

$$\omega^2 L = \frac{1}{C}$$

Now, if we multiply both sides by  $1/L$ , we get

$$\omega^2 = \frac{1}{LC}$$

but

$$\omega = 2\pi f$$

so

$$(2\pi f)^2 = \frac{1}{LC}$$

Multiplying through by  $\frac{1}{(2\pi)^2}$  we get

$$f^2 = \frac{1}{(2\pi)^2 LC}$$

Now, if we take the square root of both sides, we have

$$f = \frac{1}{2\pi \sqrt{LC}}$$

which is the familiar equation to determine the resonant frequency of a circuit.

In this development we have had several occasions to multiply unlike terms such as  $\omega \times L$ , written simply  $\omega L$ . Several times we have multiplied both sides of the equation by the same thing so the equation must still hold true. Then in the last step we took the square root of both sides to get the answer in a familiar form.

Let us now apply the above rules to some more problems. As an illustration,

$$2adc \times 3abc = 6a^2bdc^2$$

Here we note that the numerical coefficients 2 and 3 are multiplied to get 6. Then we have  $a \times a = a^2$  and  $c \times c = c^2$ . The  $d$  and  $b$  must appear in the answer because they are unlike terms, and hence the multiplication can only be indicated.

This same type of reasoning is applied to the following illustration:

$$\begin{aligned}(4x^2y^2z)(5xyz) &= 20xxxxxyyyzz \\ &= 20x^3y^4z^3\end{aligned}$$

It will be noted that the theory of exponents comes into play here; that is, when like terms are multiplied their exponents are added.

A pair of parentheses indicates one quantity. If we should have  $(4a^2b)^3$  it would mean that every unlike term in the quantity must be raised to the third power, thus getting

$$4^3(a^2)^3b^3 = 64a^6b^3$$

An exponent following a letter refers to that letter only. For example,  $xy^2$  means that only the  $y$  is raised to the second power. If we want the  $x$  also raised to second power we must write  $x^2y^2$  or  $(xy)^2$ , which are the same and mean  $xyxy$ .

So far we have dealt with single terms. We must learn how to deal with quantities with more than one term.

### *Illustrations.*

$abc$	(single term)
$a - bc$	(two terms)
$a + b - c$	(three terms)

This illustration shows that several terms in a quantity are grouped together by plus and minus signs. One quantity multiplied by another quantity, as  $(a + b)$  multiplied by  $c$ , can be expressed  $c(a + b)$  and if multiplied out gives  $ca + cb$ . This shows that *each term in the quantity must be multiplied individually*. To multiply more complicated quantities where the answer is not so evident, the following method is suggested:

$$\begin{array}{r} a + b \\ \underline{\quad c \quad} \text{multiplier} \\ ac + bc \quad \text{answer} \end{array}$$

As another illustration,

$$c(ab + cd - e^2) = abc + c^2d - ce^2$$

To show this

$$\begin{array}{r} ab + cd - e^2 \\ \underline{\quad c \quad} \\ abc + c^2d - ce^2 \end{array}$$

After the multiplication has been performed there are still three terms, but the parentheses have been removed, and the multiplication by  $c$  has been indicated in each term.

Careful attention must be given to the signs when multiplying. The following rules are, therefore, important to keep in mind.

1. Multiplication of terms with *like* signs gives a *plus* product.
2. Terms with *unlike* signs give a *minus* product.

*Illustrations.*

$$\begin{array}{ll} z(x + y) = xz + yz & z(x - y) = xz - yz \\ -z(x + y) = -xz - yz & -z(x - y) = -xz + yz \end{array}$$

The application of these rules can be extended to expressions having more than one term, as illustrated by the following:

$$(x + y)(x + y) = x^2 + 2xy + y^2$$

To show this

$$\begin{array}{r} (x + y) \text{ multiplied by } x \quad x + y \\ (x + y) \text{ multiplied by } y \quad \underline{x + y} \\ \text{Adding} \quad \quad \quad \underline{x^2 + xy} \\ \quad \quad \quad \quad \quad \underline{+ xy + y^2} \\ \quad \quad \quad \quad \quad x^2 + 2xy + y^2 \quad \text{total product} \end{array}$$

$$(x + y)(x - y) = x^2 - y^2$$

To show this

$$\begin{array}{r} (x + y) \text{ multiplied by } x \quad x + y \\ (x + y) \text{ multiplied by } -y \quad \underline{x - y} \\ \text{Adding} \quad \quad \quad \underline{x^2 + xy} \\ \quad \quad \quad \quad \quad \underline{- xy - y^2} \\ \quad \quad \quad \quad \quad x^2 \quad \quad \quad - y^2 \quad \text{total product} \end{array}$$

$$(x - y)(x - y) = x^2 - 2xy + y^2$$

To show this

$$\begin{array}{r} (x - y) \text{ multiplied by } x \quad \frac{x - y}{x^2 - xy} \\ (x - y) \text{ multiplied by } -y \quad \quad -xy + y^2 \\ \text{Adding} \quad \quad \quad \frac{x^2 - 2xy + y^2}{\text{total product}} \end{array}$$

$$(a - c)(d + f) = ad - cd + af - cf$$

To show this

$$\begin{array}{r} (a - c) \text{ multiplied by } d \quad \frac{a - c}{ad - cd} \\ (a - c) \text{ multiplied by } f \quad \quad + af - cf \\ \text{Adding} \quad \quad \quad \frac{ad - cd + af - cf}{\text{total product}} \end{array}$$

In the first three examples common terms were placed in the same column and added, but in the last example there were no common terms, so the complete expression had to be written out.

Particular care must be taken to keep the signs of the individual terms correct. If the student follows this procedure, very little trouble should be experienced, because each step in itself is very simple.

**Division.**—To reverse the above process, the law of exponents is readily applied.

*Illustrations.*

$$\begin{aligned} \frac{C}{C} &= C^0 = 1 \\ \frac{C^4}{C^2} &= \frac{CCCC}{CC} = C^2 \quad (\text{by cancellation}) \\ \frac{abc^2}{bc} &= \frac{abcc}{bc} = ac \quad (\text{by cancellation}) \end{aligned}$$

The first illustration is an important one to remember. As mentioned in the previous lessons, any quantity raised to the zero power gives 1. In the second example the two C's in the denominator canceled the two C's in the numerator, giving 1 to be multiplied by  $C^2$ , but to simplify, the 1 is dropped in the answer and it is understood that the coefficient of  $C^2$  is 1. The 1 is used only when there are no other factors in the product.

The division of unlike terms must be indicated because they cannot be further simplified.

*Illustrations.*

$$\frac{X}{R} \quad \frac{1}{4\pi^2 LC} \quad \frac{E}{I}$$

As in multiplication, if a quantity is to be divided by a term, each term in that quantity must be divided by that term. As an illustration,

$$\frac{x^2 + xy + x^3z}{x} = x + y + x^2z$$

In this illustration the division could actually be performed, but when there are unlike terms the division must be indicated. To illustrate,

$$\frac{ab + cd}{a} = b + \frac{cd}{a}$$

The second term in the numerator did not contain  $a$ , so the division was indicated.

**Reciprocals.**—Reciprocals are very convenient in problems involving fractions. As shown before, the reciprocal of 10 is  $\frac{1}{10} = 0.1$ .

Extending this principle, we get illustrations like the following:

The reciprocal of  $y$  is  $\frac{1}{y}$ ; that of  $\frac{1}{10}$  is  $\frac{1}{\frac{1}{10}} = 10$ , of  $\frac{1}{x}$  is  $\frac{1}{\frac{1}{x}} = x$

Instead of dividing by a number, multiply by its reciprocal. To illustrate,

$$\begin{aligned} 1. \quad & \frac{y}{1/x} = y \frac{x}{1} = yx \\ 2. \quad & \frac{I}{100} = I \left( \frac{1}{100} \right) = 0.01I \\ 3. \quad & \frac{xy + zy}{y/(x+z)} = \frac{(xy + zy)(x+z)}{y} \\ & = (x+z)(x+z) \\ & = x^2 + 2xz + z^2 \end{aligned}$$

**Removal of Parentheses.**—A single pair of parentheses can always be removed from an algebraic expression. In case the sign before it is plus, no change is necessary; but if a minus is before it, the sign of all the terms within it must be changed.

*Illustrations.*

$$\begin{aligned} a + (b - cd) &= a + b - cd \\ a - (-b + cd) &= a + b - cd \end{aligned}$$

It will be noted that no signs were changed in the first illustration, but because of the negative sign in the second illustration before the parentheses, the signs between them had to be changed when they were removed.

**Factoring.**—Already, in division, some factoring in effect has been done. For example, we wish to remove  $x$  from within the following parenthesis without changing the value of the quantity.

$$(ax + b^2x^2 - cxy)$$

Since  $x$  appears in each term, we can divide each term by  $x$ ; thus

$$\frac{ax}{x} = a$$

is the way the first term is handled. Applying this to each term, we have

$$\frac{ax + b^2xx - cxy}{x} = a + b^2x - cy$$

Since  $x$  is now divided out,

$$ax + b^2x^2 - cxy \neq a + b^2x - cy$$

This unequal sign,  $\neq$ , means that one side is not equal to the other side. To make it equal we must multiply the right-hand side by  $x$ , thus

$$ax + b^2x^2 - cxy = x(a + b^2x - cy)$$

From multiplication we see that if  $x$  is multiplied by the quantities in the parenthesis, the left-hand side of the equation is obtained. So, factoring is really the reverse of multiplication. It is usually done to obtain a desired result which will be illustrated later.

**Substituting Terms.**—Terms may be substituted in an equation provided each term substituted has the same value as the term it replaces. To illustrate, the formula for the velocity of light is

$$\lambda f = c$$

$$f = \frac{c}{\lambda}$$

Now in the equation,  $f = \frac{1}{2\pi \sqrt{LC}}$  we can substitute for  $f$  and have

$$\frac{c}{\lambda} = \frac{1}{2\pi \sqrt{LC}}$$

Complex expressions are often simplified by substitution when several operations are to be performed, thus saving the labor of writing the whole expression out each time. The impedance of an alternating current circuit can be expressed

$$Z = \sqrt{R^2 + \left(2\pi fL - \frac{1}{2\pi fC}\right)^2}$$

This can be simplified by making the following substitutions:

$$X_L = 2\pi fL$$

and

$$X_C = \frac{1}{2\pi fC}$$

which give

$$Z = \sqrt{R^2 + (X_L - X_C)^2}$$

Now if we let  $X = X_L - X_C$  we can simplify still further and have

$$Z = \sqrt{R^2 + X^2}$$

In this case we assume  $X_L$  larger than  $X_C$ . If  $X_L$  were smaller than  $X_C$ , the value of  $X$  would be negative, but  $X$  multiplied by itself,  $X^2$ , would be positive. This means that the assumption is not necessary to get the correct answer.

**Solving Equations.**—All the necessary theory has now been covered to solve equations. Summarizing, these *rules* are

1. The same quantity can be *added* to both sides of an equation, without destroying the equality of the equation.

2. The same quantity can be *subtracted* from both sides of an equation, without destroying the equality of the equation.

3. A term can be transposed from one side of an equation to the other, *if the sign is changed*, without destroying the equality of the equation. (This is a result of Rules 1 and 2.)

4. If *all the signs* in an equation are changed, the equality of the equation will not be destroyed.

5. Both sides of an equation can be *multiplied* by the same quantity without destroying the equality of the equation.

6. The same quantity can be *divided* into both sides of an equation, without destroying the equality of the equation. In other words, terms can be canceled.

7. Both sides of an equation can be *raised to the same power* without destroying the equality of the equation.

8. The *reciprocal* of one side of an equation is equal to the reciprocal of the other side.

9. Both sides of an equation can have *the same root extracted*, without destroying the equality of the equation.

10. Terms in an equation can be replaced by *terms that are equal* in value.

To solve or evaluate an equation we use the above rules in order that the term for which we are solving can be placed on only *one side of the equation*. With all other terms of known value on the opposite side, we have a solution and thus know the value of the unknown quantity in terms of known quantities. The usual practice is to arrange unknown terms on the left-hand side of the equation and all known terms on the right-hand side.

For example,  $E = IR$  is an expression of Ohm's law. If  $I = 8$  and  $R = 6$ , we can replace  $I$  and  $R$  by the values they equal and then solve for the unknown value of  $E$ , thus

$$E = (8)(6) = 48$$

Sometimes an algebraic equation is indeterminate; that is, it cannot be solved as explained above. To illustrate,

$$IX_L = 2\pi fLI$$

where  $L = 30$ .

$$f = 60.$$

$$2\pi = 6.28.$$

$$X_L = 11,300.$$

$$\text{Substituting} \quad 11,300I = (6.28)(60)(30)I$$

$$11,300I = 11,300I$$

$$I = I$$

$$1 = 1$$

In such cases as this it is not possible to place the unknowns on one side of the equation and the knowns on the other side; therefore, no solution is possible.

*Illustrations of the Use of Above Ten Rules.*

Given	$x - y = z$	
add	$\frac{+ y}{x} = \frac{+ y}{z + y}$	(Rules 1 and 3)

To make this perfectly clear, let  $x = 10$ ,  $y = 8$ , and  $z = 2$ .  
Then, substituting,

	$10 - 8 = 2$
or	$10 = 2 + 8$

Now, use Rule 2 and subtract  $x$  from each side of the equation.

Given	$x - y = z$
Subtract	$+ x = + x$
giving,	$- y = z - x$
Substituting,	$- 8 = 2 - 10$

This is seen to be true.

Changing all signs,

	$y = -z + x$	(Rule 4)
or	$8 = -2 + 10$	

This also is true.

Even though the value of both sides of the equation is changed in each of these cases, the equality is not destroyed.

For an example in multiplication and division we have the general form of Ohm's law,

$$I = \frac{E}{Z}$$

It is desired to solve for the voltage  $E$ . Multiply both sides by  $Z$ , giving

$$IZ = \frac{E}{Z} (Z) \quad (\text{Rule 5})$$

On the right-hand side,  $\frac{E}{Z} (Z) = \frac{EZ}{Z} = E$

But we want  $E$  on the left-hand side so we turn the equation around and have

$$E = IZ \quad (\text{the solution})$$

Now let us solve this equation for  $Z$ . Dividing both sides by  $I$  gives

$$\frac{E}{I} = \frac{IZ}{I} \quad (\text{Rule 6})$$

By canceling  $I$ ,

$$\frac{E}{I} = Z$$

As above, turning the equation around gives

$$Z = \frac{E}{I} \quad (\text{the solution})$$

As another illustration, the  $Q$  of a circuit is given by the equation

$$Q = \frac{2\pi fL}{R}$$

If we know the figure of merit  $Q$ , the frequency  $f$ , and the resistance  $R$ , we can solve for the inductance  $L$  as follows:

$$Q = \frac{2\pi fL}{R}$$

Multiplying both sides by  $R$  removes the denominator on the right-hand side, thus

$$RQ = 2\pi fL$$

Dividing both sides by  $2\pi f$  transfers the  $2\pi f$  from the right side of the equation to the left. Thus

$$\frac{RQ}{2\pi f} = L$$

Then, by turning the equation around,

$$L = \frac{RQ}{2\pi f} \quad (\text{the solution})$$

Suppose we wish to find the plate resistance ( $R_p$ ) in a vacuum tube from the following equation:

$$A = \frac{\mu R}{R + R_p}$$

Clearing of fractions, by multiplying both sides by the denominator on the right side, gives

$$A(R + R_p) = \mu R$$

Removing the parentheses and multiplying each term inside them by  $A$ , we get

$$AR + AR_p = \mu R$$

Subtracting  $AR$  from both sides,

$$AR_p = \mu R - AR$$

Dividing both sides by  $A$ ,

$$R_p = \frac{\mu R - AR}{A}$$

This is the required solution for  $R_p$ .

The procedure of removing the denominator and clearing of fractions, shown above, is one of the most useful in solving equations. When any equation with fractions is to be solved they should be removed by this means.

The last step is also important, for the desired term is often multiplied by other known factors. In such cases dividing both sides of the equation by this known term will leave the unknown alone on the left-hand side and give the desired answer.

Solve the above equation for  $R$ .

$$A = \frac{\mu R}{R + R_p}$$

Clearing of fractions,

$$A(R + R_p) = \mu R$$

Removing the parentheses,

$$AR + AR_p = \mu R$$

Subtracting  $AR$  from both sides,

$$AR_p = \mu R - AR$$

Factoring the right-hand side by dividing through by  $R$  and multiplying by  $R$ ,

$$AR_p = \frac{R(\cancel{\mu R} - A\cancel{R})}{\cancel{R}} = R(\mu - A)$$

Turning the equation around to get  $R$  on the left-hand side,

$$R(\mu - A) = AR_p$$

Dividing both sides by  $(\mu - A)$ ,

$$R = \frac{AR_p}{\mu - A}$$

Solving for  $R$  was slightly more complicated but each step in itself was quite simple. The student should write out each step when solving problems until the procedure is thoroughly understood. If the steps are written out in detail, mistakes will be less likely to occur.

In an alternating current circuit,

$$I = \frac{E}{\sqrt{R^2 + X^2}}$$

To solve this equation for  $X$ , proceed as follows:  
Clearing of fractions and turning the equation around,

$$E = I \sqrt{R^2 + X^2}$$

Dividing by  $I$ ,

$$\frac{E}{I} = \sqrt{R^2 + X^2}$$

Squaring both sides (Rule 7) and turning the equation around,

$$R^2 + X^2 = \left(\frac{E}{I}\right)^2$$

Transposing  $R^2$  (subtracting  $R^2$  from both sides),

$$X^2 = \frac{E^2}{I^2} - R^2$$

Reducing to a common denominator,

$$X^2 = \frac{E^2}{I^2} - \frac{R^2 I^2}{I^2} = \frac{E^2 - R^2 I^2}{I^2}$$

Extracting the square root of both sides (Rule 8),

$$X = \sqrt{\frac{E^2 - R^2 I^2}{I^2}} \quad \text{or} \quad X = \frac{\sqrt{E^2 - R^2 I^2}}{\sqrt{I^2}} = \frac{\sqrt{E^2 - R^2 I^2}}{I}$$

The student should become familiar with these processes and be able to prove such problems. To prove this problem, take the answer and solve for  $I$ .

$$X = \frac{\sqrt{E^2 - R^2 I^2}}{I}$$

Clearing of fractions,

$$IX = \sqrt{E^2 - R^2 I^2}$$

Squaring both sides to remove the radical,

$$I^2 X^2 = E^2 - R^2 I^2$$

Transposing  $I^2 R^2$ ,

$$I^2 X^2 + I^2 R^2 = E^2$$

Factoring  $I^2$ ,

$$I^2 (X^2 + R^2) = E^2$$

Dividing by  $(X^2 + R^2)$ ,

$$I^2 = \frac{E^2}{X^2 + R^2}$$

Extracting the square root of both sides by rule 9,

$$I = \sqrt{\frac{E^2}{R^2 + X^2}} = \frac{\sqrt{E^2}}{\sqrt{R^2 + X^2}} = \frac{E}{\sqrt{R^2 + X^2}}$$

Which is the original equation and indicates that the solution is correct.

Another help is to substitute known values in the equation and prove the answer is correct for a particular case. If it is true for a particular case, it will likely hold in the general solution. Thus, let  $E = 100$  volts,  $R = 8$  ohms resistance, and  $X = 6$  ohms reactance.

Then

$$I = \frac{E}{\sqrt{R^2 + X^2}} = \frac{100}{\sqrt{8^2 + 6^2}} = \frac{100}{\sqrt{64 + 36}} = \frac{100}{10} = 10 \text{ amp}$$

Substituting these values in the answer and solving for  $X$  give

$$\begin{aligned} X &= \frac{\sqrt{E^2 - I^2 R^2}}{I} = \frac{\sqrt{100^2 - (10)^2 (8)^2}}{10} = \frac{\sqrt{10,000 - 6,400}}{10} \\ &= \frac{\sqrt{3,600}}{10} = \frac{60}{10} = 6 \text{ ohms reactance} \end{aligned}$$

This checks the value given above.

In case the student may not know when to square or when to extract a square root, it may be helpful to remember that  $X = (\sqrt{X})^2$ , so if  $X^2$  is given, extract the square root to get  $X$  and if  $\sqrt{X}$  is given, square the quantity to get  $X$ . Of course rules 7 and 8 must be remembered when performing these operations on equations. Both sides of the equation must be treated alike.

In the equation,

$$X_i = X_c$$

we know that

$$X_i = 2\pi fL \quad \text{and} \quad X_c = \frac{1}{2\pi fC}$$

Therefore, by substituting as pointed out in rule 10, we can write

$$2\pi fL = \frac{1}{2\pi fC}$$

### Exercises

1.  $x + y = a - b$ . Find  $y, b$ .
2.  $ax + by - cz = R$ . Find  $b, z$ .
3.  $RST = XY - JQ$ . Find  $S, Q$ .

18.  $K = \frac{M}{\sqrt{L_1 L_2}}$ . Find  $L_1$ .

19.  $R_t = R_o(1 + at)$ . Find  $t$ .

20.  $\lambda = 1884 \sqrt{LC}$ . Find  $C$ .

## CHAPTER 4

### GEOMETRY

This lesson will be concerned with the study of the right triangle. Conventional geometry as given in high school is not touched upon in this lesson. All the student need remember from high-school geometry is how to find the hypotenuse of a right triangle if the two legs are given.

In studying electrical engineering, it is often desirable to add voltages and currents that are not always in phase. These voltages and currents can be represented by means of vectors and added by means of geometric addition.

*Arithmetic addition* concerns itself with adding positive numbers only. Graphically, this means that only numbers from the origin out along a positive axis can be considered. This permits the addition of vectors in only one direction.

*Algebraic addition* concerns itself with adding both positive and negative numbers. Graphically, this means that all numbers on a straight line through the origin can be handled. This number system is twice as large as that of arithmetic addition. This permits the addition of vectors acting in the same direction or in exact opposition.

*Geometric addition* concerns itself with adding vectors in a plane and hence has generalized algebraic addition much as algebraic addition has generalized arithmetic addition.

A *vector* is a quantity which has both *magnitude and direction*. Quantities such as dimensions, weight, and temperature have magnitude only. Quantities with magnitude only are called "scalar quantities." Quantities such as displacement, velocity, force, voltage, current, and impedance have direction in addition to magnitude. These quantities are called "vector quantities"; they are represented by directed lines called "vectors." The length of the line represents the magnitude, and the line is drawn in the direction of the vector. An arrow on the end of the line indicates its sense.

**Arithmetic Addition.**—Let us consider a force vector  $A = 6$  pounds, and another force vector  $B = 8$  pounds, acting in the same direction on point  $O$  (the origin), as illustrated in Fig. 5.

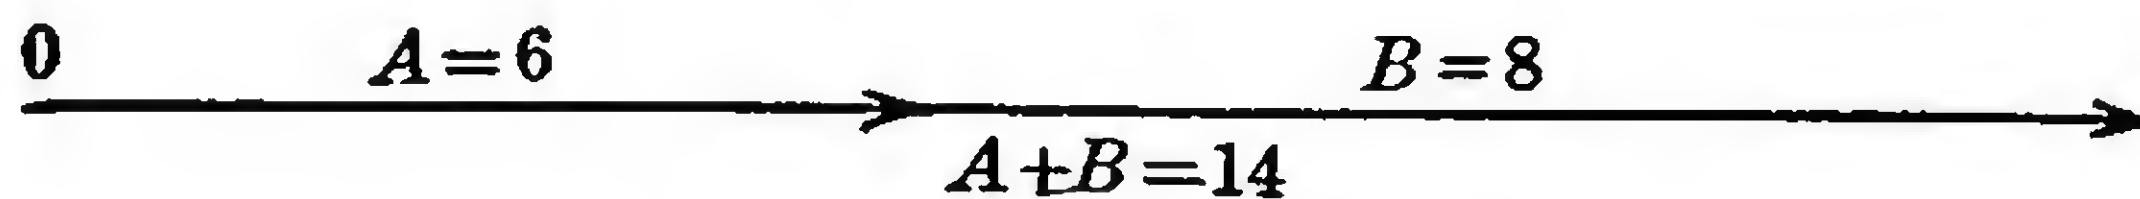

FIG. 5.—Arithmetic addition of vectors.

In this case arithmetic, algebraic, and geometric addition are the same. The point  $O$  is acted on by the total force,

$$A + B = 6 + 8 = 14 \text{ pounds} \quad \text{Ans.}$$

*Example 1.* An automobile going east is stuck in the mud. A tractor coupled to the front of the automobile exerts a pull of 400 lb. If the car is able to exert an aiding force of 300 lb., what is the total force, acting in an easterly direction moving it out of the mud?

*Solution.* Let  $A = 400$  lb., the tractor force.

$B = 300$  lb., the auto force.

$$C = A + B = 400 + 300 = 700 \text{ lb.} \quad \text{Ans.}$$

**Algebraic Addition.**—Now let the force  $A$  act in the opposite direction as shown in Fig. 6. The resultant force is in the direction of vector  $B$ . That is,  $A + B = -6 + 8 = 2$  pounds. *Ans.*

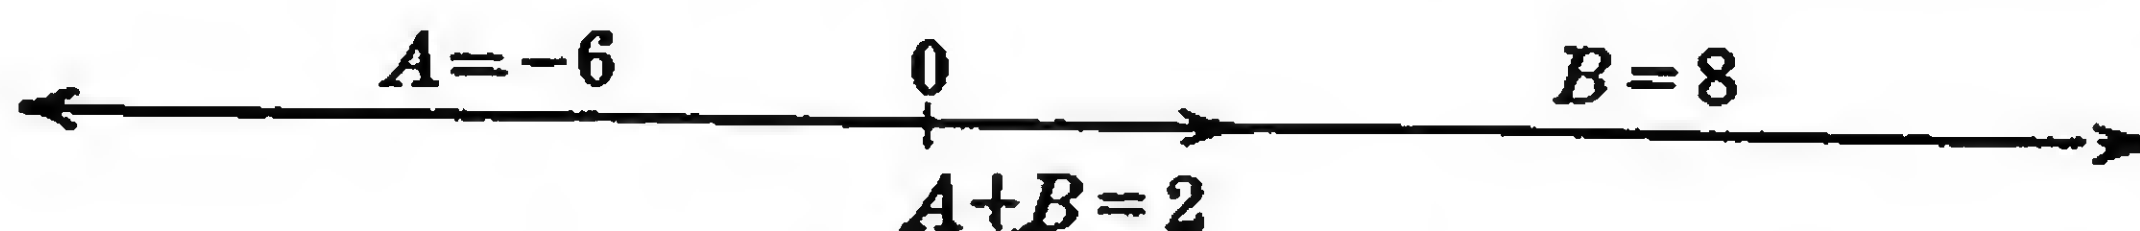

FIG. 6.—Algebraic addition of vectors.

Since  $A$  in this case is a negative quantity, arithmetic addition does not apply in this case, but algebraic and geometric addition do apply.

*Example 2.* If the tractor is connected to the back of the auto in Example 1, determine the total force acting on the auto in a westerly direction.

*Solution.*  $C = A + B = -400 + 300 = -100$  lb. *Ans.*

**Geometric Addition.**—Now let the force  $A = 6$  act at right angles to the force  $B = 8$  as shown in Fig. 7.<sup>1</sup>

Since vectors  $A$  and  $B$  are not in the same straight line, neither arithmetic nor algebraic addition applies, so we must rely upon geometric addition in this case. Our common sense tells us that with these forces acting on the point  $O$  it will tend to move in the direction of both forces  $A$  and  $B$  and the resulting movement

<sup>1</sup> The complete expression for a vector will be given later, see p. 80.

will be in a direction somewhere between vectors  $A$  and  $B$ . If vectors  $A$  and  $B$  were of the same magnitude, the resulting movement would take place halfway between the two vectors, but since vector  $B$  is greater than  $A$  the movement will be in a direction nearer to the direction of vector  $B$  than in the direction of vector  $A$ .

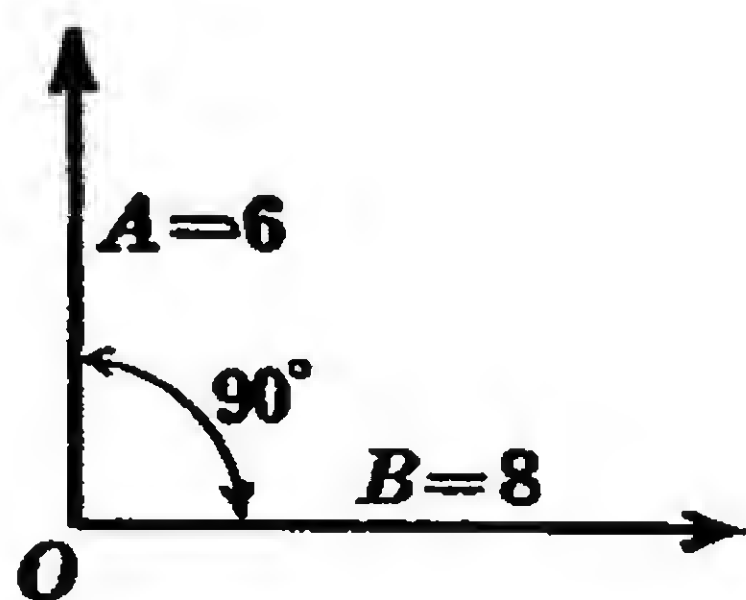

FIG. 7.—Geometric addition of vectors.

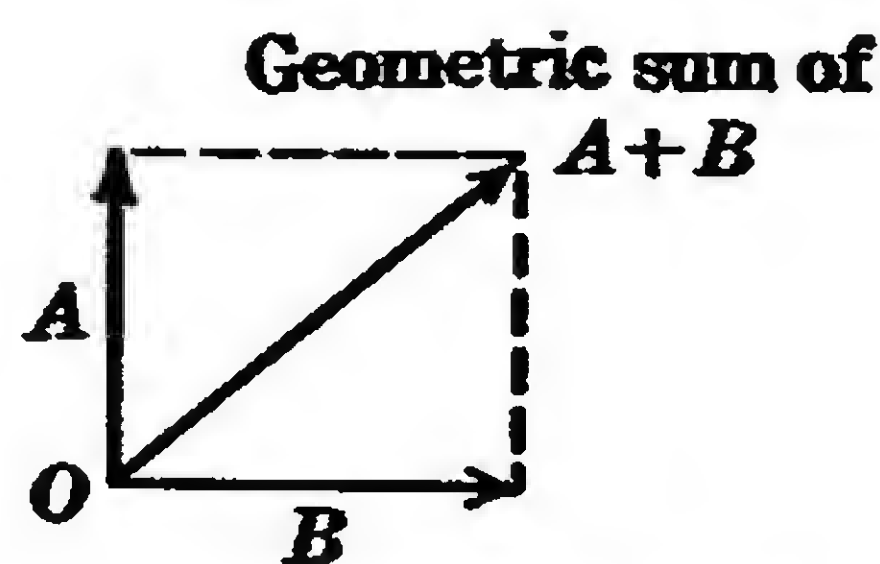

FIG. 8.—Geometric addition of vectors by completing the rectangle.

The geometric sum of vectors  $A$  and  $B$  is obtained by completing the parallelogram (rectangle, in this case) and drawing the diagonal from the origin  $O$  to the opposite corner. This diagonal of the parallelogram is in the correct direction and has the correct length to represent the geometric sum of vectors  $A$  and  $B$ . Figure 8 illustrates this geometric addition. The geometric sum of  $A + B$  is the hypotenuse of a right triangle made up of vectors  $B$  and  $A$  as the two sides shown in Fig. 9.

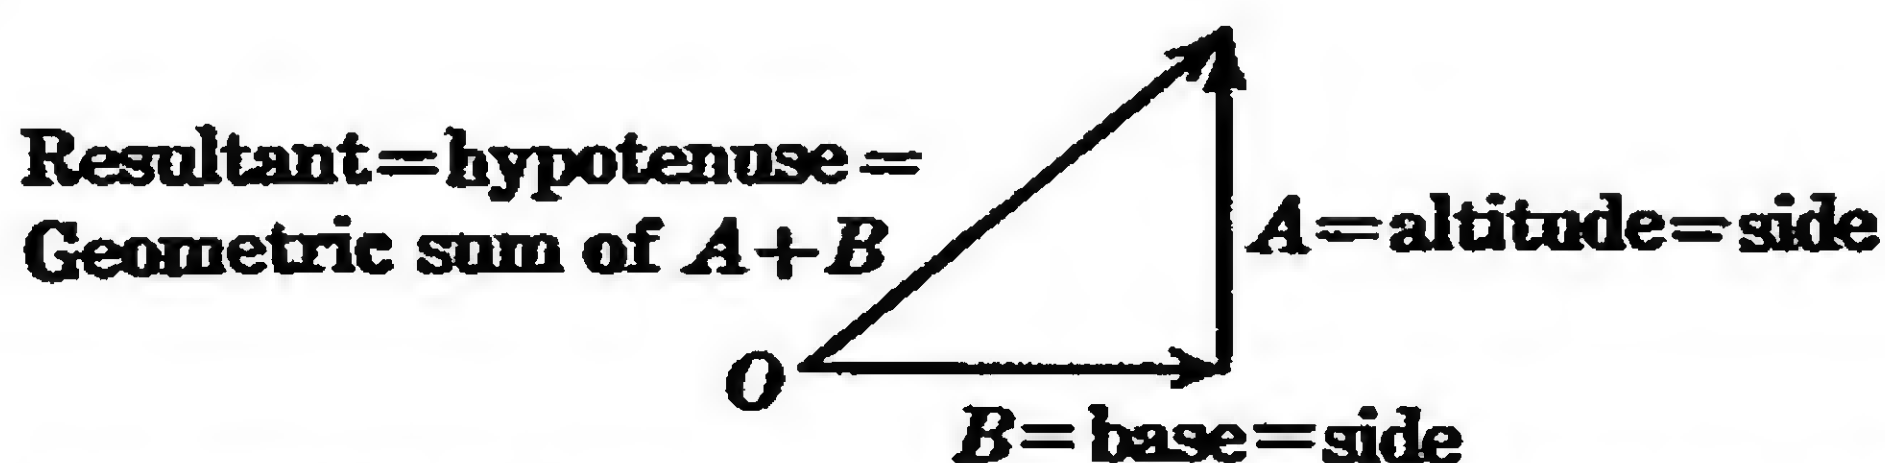

FIG. 9.—Geometric addition of vectors by using the right triangle.

Figure 8 gives the same result as Fig. 9, but Fig. 9 gives the true vector triangle for addition geometrically. Vector  $A$  can be moved from its position in Fig. 8 to its position in Fig. 9 without altering its magnitude or direction and therefore is the same vector.

*The hypotenuse of a right triangle is equal to the square root of the sum of the squares of the other two sides.*

If  $C$  is the hypotenuse with  $A$  and  $B$  the two sides, then

$$C = \sqrt{A^2 + B^2} \quad (1)$$

Applying this basic principle of geometric addition to the above

illustration we find that the magnitude of the resultant in terms of the magnitude of the sides is<sup>1</sup>

$$\begin{aligned}\text{Resultant} &= \sqrt{|A|^2 + |B|^2} = \sqrt{6^2 + 8^2} = \sqrt{36 + 64} \\ &= \sqrt{100} = 10 \quad \text{Ans.}\end{aligned}$$

Then the total force acting on the point  $O$  is 10 pounds and will be in the direction of the resultant vector  $A + B$  as shown in Fig. 9. *Note:* " $A + B$ " in this case means geometric addition and is equal to 10 instead of 14, the algebraic sum of the magnitude of  $A = 6$  and  $B = 8$ .

The hypotenuse of a right triangle must always be longer than either of the other two sides. It is always the side opposite the right angle (90 degrees) in the triangle.

*Example 3.* If the tractor is connected to the side of the automobile of Example 1 and pulls due north, determine the magnitude of the force acting on the automobile in a northeasterly direction.

*Solution.*

$$\begin{aligned}|C| &= \sqrt{|A|^2 + |B|^2} = \sqrt{400^2 + 300^2} \\ &= \sqrt{160,000 + 90,000} = \sqrt{250,000} \\ &= 500 \text{ lb.} \quad \text{Ans.}\end{aligned}$$

**Parallelogram Law.**—This law is the fundamental principle on which it is possible to determine the effect of a group of vectors

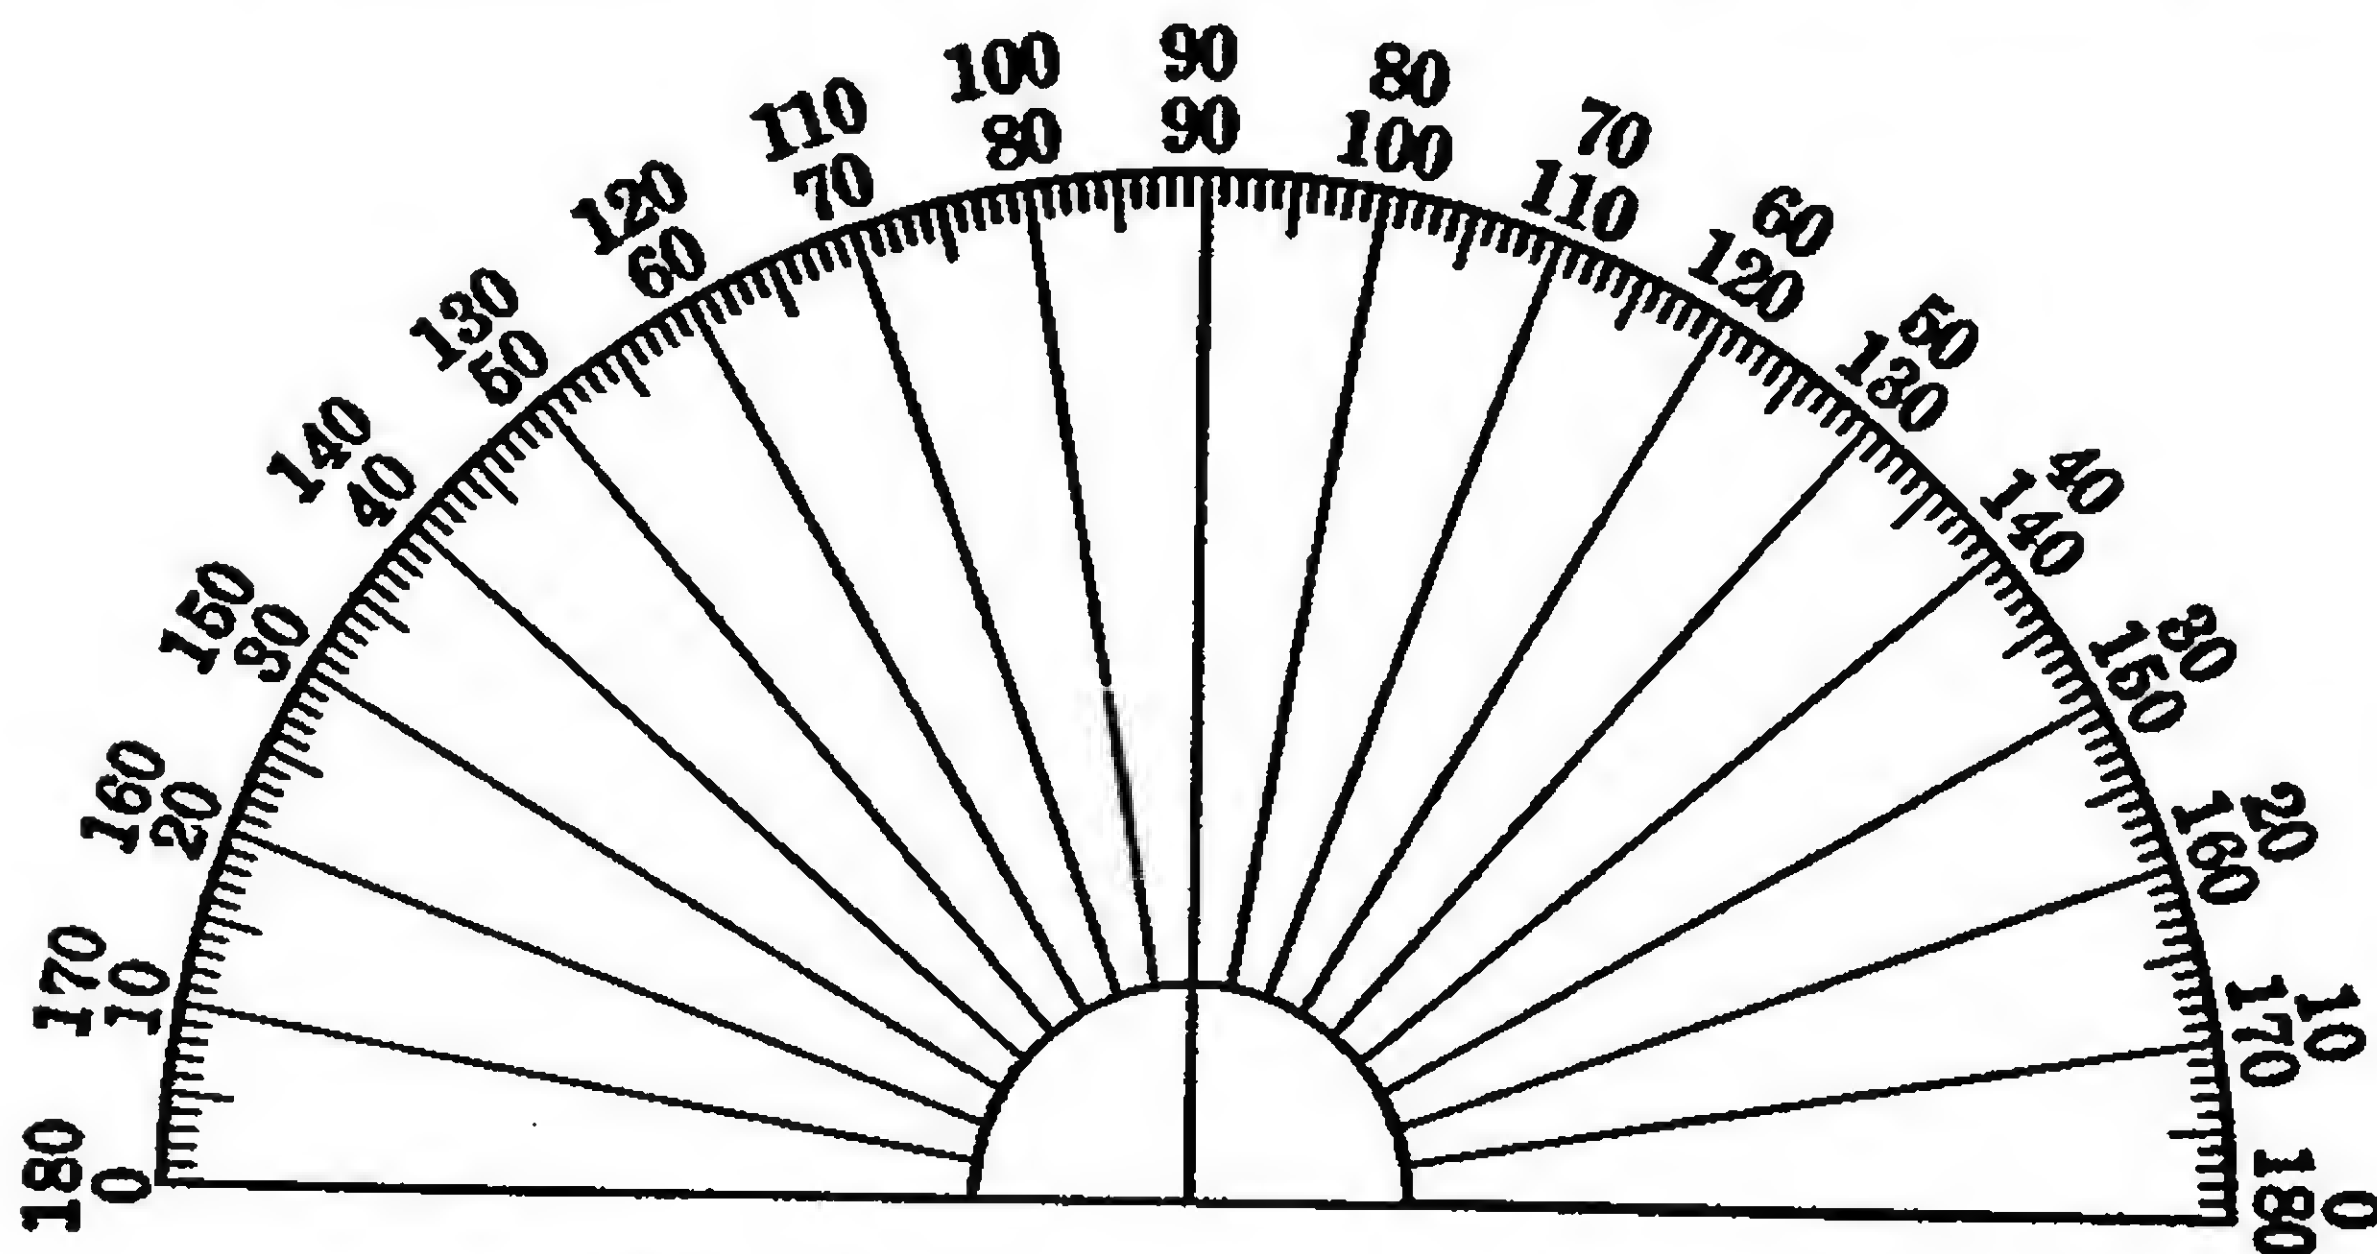

FIG. 10.—Semicircular protractor.

(forces). The law states that *the resultant of two vectors (forces) which act at any angle upon a rigid body, or point, is represented in magnitude and direction by the diagonal of a parallelogram, the*

<sup>1</sup> The vertical bars placed on both sides of  $A$  and  $B$  are used to denote *magnitude only* of the quantity between them.

sides of which represent the magnitude and direction of the two vectors (forces). The diagonal representing the resultant starts from the corner where the two vectors start and extends to the opposite corner. The parallelogram is constructed by drawing lines through the end of each vector parallel to the other vector. Usually dotted lines are employed. The end of the resultant will then be at the point where the dotted lines intersect. The angle of the resultant can be determined by means of a protractor as shown in Fig. 10.

**Example 4.** The magnitude of vectors  $A$  and  $B$  is 7.07 and the angle between them is 90 degrees as shown in Fig. 11. Determine the direction and magnitude of the resultant.

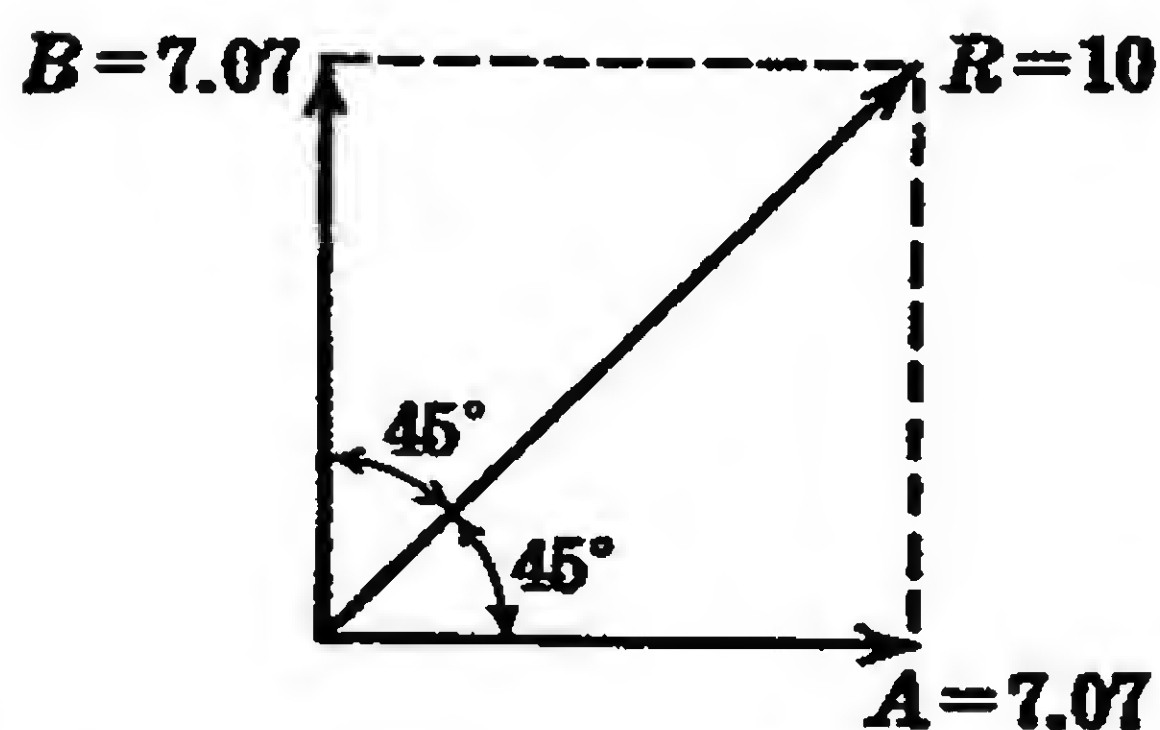

FIG. 11.—Geometric addition of vectors by completing the square.

**Solution.** First, always draw a vector diagram, to scale, of the given relations, in this case vectors  $A$  and  $B$ .

Second, complete the parallelogram by means of dotted lines as shown in Fig. 11.

Third, draw the resultant vector,  $R$ , from the intersection of the two vectors to the intersection of the two dotted lines. This is the desired diagonal of the parallelogram.

Fourth, calculate the magnitude of the resultant, thus

$$|R| = \sqrt{|A|^2 + |B|^2}$$

In this case,

$$\begin{aligned} |R| &= \sqrt{(7.07)^2 + (7.07)^2} \\ &= \sqrt{50 + 50} \\ &= \sqrt{100} = 10 \quad \text{Ans.} \end{aligned}$$

Fifth, measure the angle of the resultant, which in this case is  $45^\circ$ . *Ans.*

The above example is of special importance. When two equal forces act at right angles to each other the resulting movement is halfway between them, that is, 45 degrees from either force.

For a general case, let us consider vector  $A$  and vector  $B$  with an angle of  $\theta$  degrees between  $A$  and  $B$  as shown in Fig. 12.

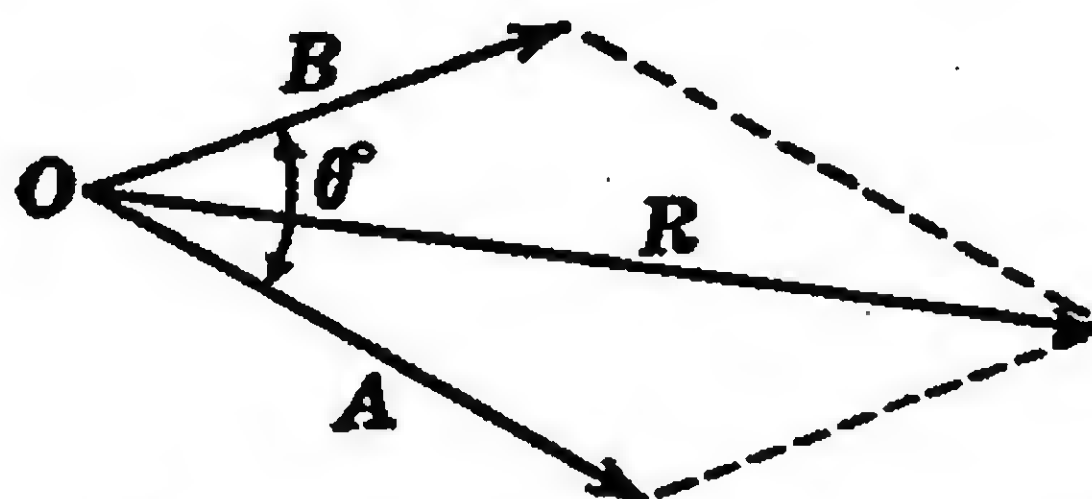

FIG. 12.—Geometric addition of vectors by completing the parallelogram.

From the parallelogram law, the resultant vector  $R$  in Fig. 12 is the geometric sum of vectors  $A + B$ . But  $A$  and  $B$  cannot

be added as in the above example, since they are not at right angles. Such problems can always be worked graphically but, since it is seldom convenient to do so, the necessary mathematics will be given to handle them analytically. Since geometric addition depends upon right triangles, this problem must be broken up into right triangles.

**Resolution of a Vector.**—So far it has been shown that two vectors can be added to get the resultant vector. The reverse of this process—namely, the resolution of a vector—is also of great importance. Taking a horizontal line, called the  $x$ -axis, and cutting it at right angles by a vertical bisector, called the  $y$ -axis, gives us a basis on which to work to resolve the vectors into other vectors at right angles to each other. In Fig. 12 the vector  $A$  is drawn acting on the point  $O$ , called the origin, where the  $y$ -axis intersects the  $x$ -axis. Dotted perpendicular lines are drawn from the extreme end of vector  $A$  to the two axes. The dotted lines that are perpendicular to one axis are parallel to the other. The dotted perpendicular to the  $x$ -axis in Fig. 13 marks off the vector  $A_x$  on this axis and the dotted perpendicular to the  $y$ -axis marks off  $A_y$  on this axis. It can be seen that  $A_x$  and  $A_y$ , being at right angles, can be added geometrically to obtain the diagonal vector  $A$  which is the resultant of their sum. That is, the magnitude of<sup>1</sup>

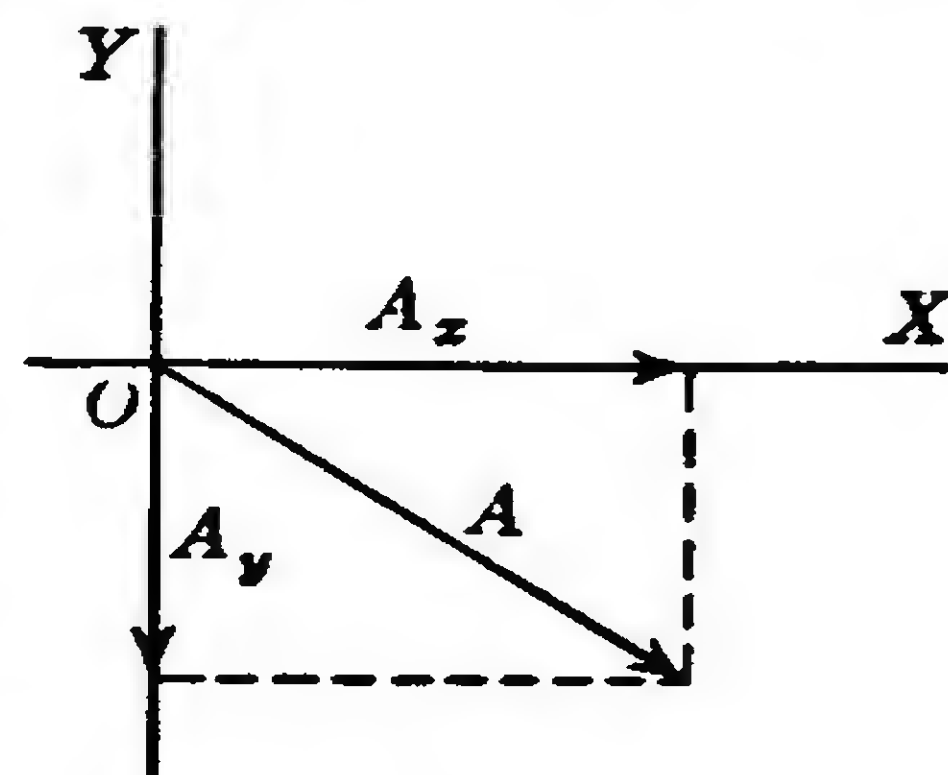

FIG. 13.—Resolution of vector  $A$  into its  $x$  and  $y$  components.

$$|A| = \sqrt{A_x^2 + A_y^2} \quad (2)$$

These vector forces  $A_x$  and  $A_y$  are known as the “vertical” or “ $y$ -component” and “horizontal” or “ $x$ -component” of  $A$ . The vector  $A$  can then be replaced by vectors  $A_x$  and  $A_y$  acting at right angles to each other.<sup>2</sup>

Similarly, vector  $B$  of Fig. 12 can be drawn from the origin  $O$  as shown in Fig. 14 and be resolved into its components  $B_x$

<sup>1</sup> The components  $A_x$  and  $A_y$  are also vectors; hence, by rights, they should be expressed as magnitudes  $|A_x|$  and  $|A_y|$  in this equation. For the sake of simplicity, however, and where it will not cause confusion, these components which have their direction specified by the subscript will be written without vertical bars to designate magnitude.

<sup>2</sup> The subscripts are used here to designate the direction of the vectors.

along the horizontal or  $x$ -axis and  $B_y$  along the vertical or  $y$ -axis. Now we have in place of  $B$  its components  $B_x$  and  $B_y$ , which are at right angles and can be handled in geometric addition. In this case, the magnitude of vector  $B$  is

$$|B| = \sqrt{B_x^2 + B_y^2} \quad (3)$$

To solve the general case as illustrated in Fig. 12 we can combine the results of Fig. 13 and Fig. 14. We add algebraically the vertical or  $y$ -axis components to get the total  $y$ -component and the horizontal or  $x$ -axis components to get the total  $x$ -component. The geometric sum of the total  $y$ -component and the total  $x$ -component gives the same resultant as was obtained by using the parallelogram law graphically. That is, the magnitude of the resultant

$$|R| = \sqrt{(A_x + B_x)^2 + (A_y + B_y)^2} \quad (1)$$

The combined results of Fig. 13 and Fig. 14 are shown in Fig. 15. It should be noted that these components must be

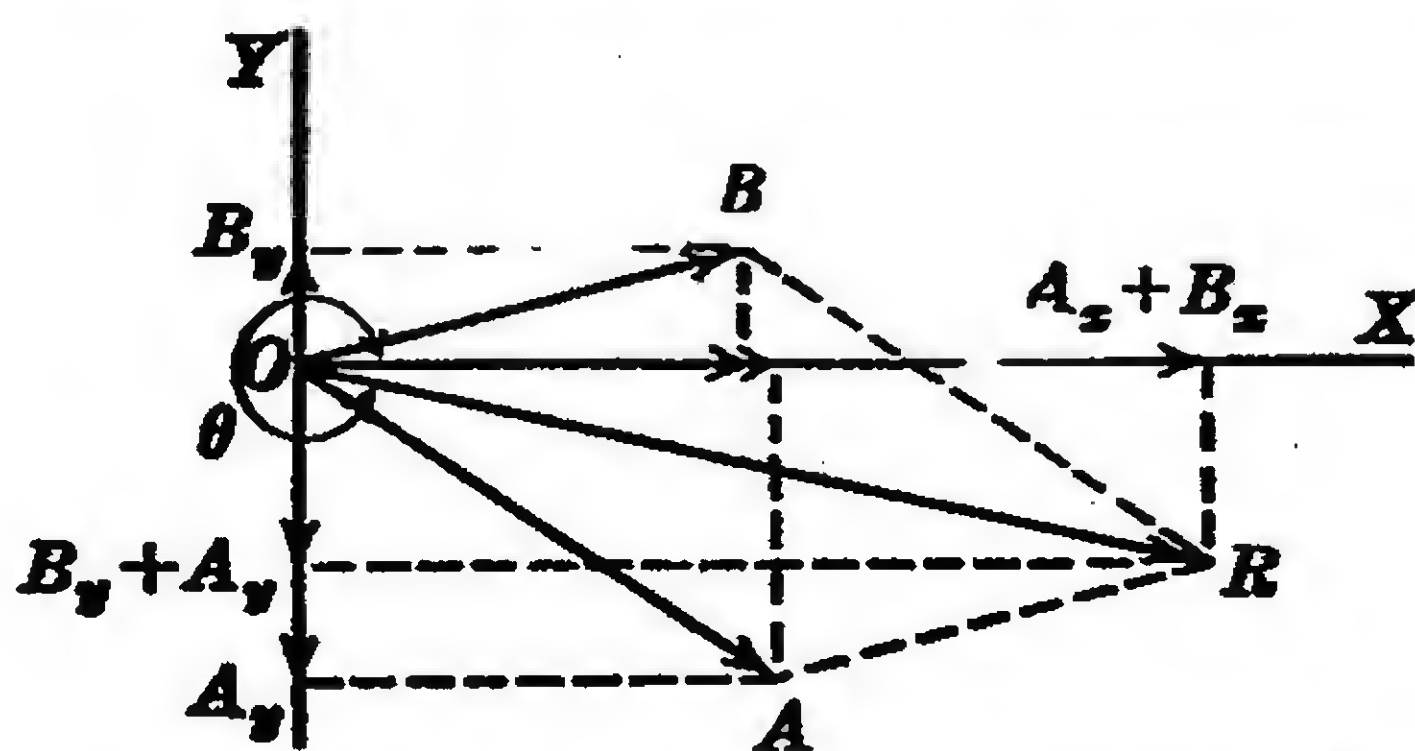

FIG. 15.—Geometric addition of the  $A$  and  $B$  components to determine the resultant vector  $R$ .

added *algebraically*. For instance, in Fig. 15,  $A_y$  must be actually subtracted arithmetically from  $B_y$  to obtain their algebraic sum,  $A_y + B_y$ , because  $A_y$  is a negative number. Distances measured to the right of the origin  $O$  on the  $x$ -axis are positive and those measured to the left are negative. Distances measured up from the origin  $O$  on the  $y$ -axis are positive while those measured down are negative. The resultant vector  $R$  forms the hypotenuse of a right triangle with sides of length  $A_x + B_x$  and  $A_y + B_y$ .

By using the  $x$ -axis and  $y$ -axis as a framework or reference system, it is possible to determine accurately not only the magnitude of the resultant but also its direction. The direction is usually expressed in degrees measured from the positive  $x$ -axis in a counterclockwise direction. Figure 16 plainly illustrates four examples.

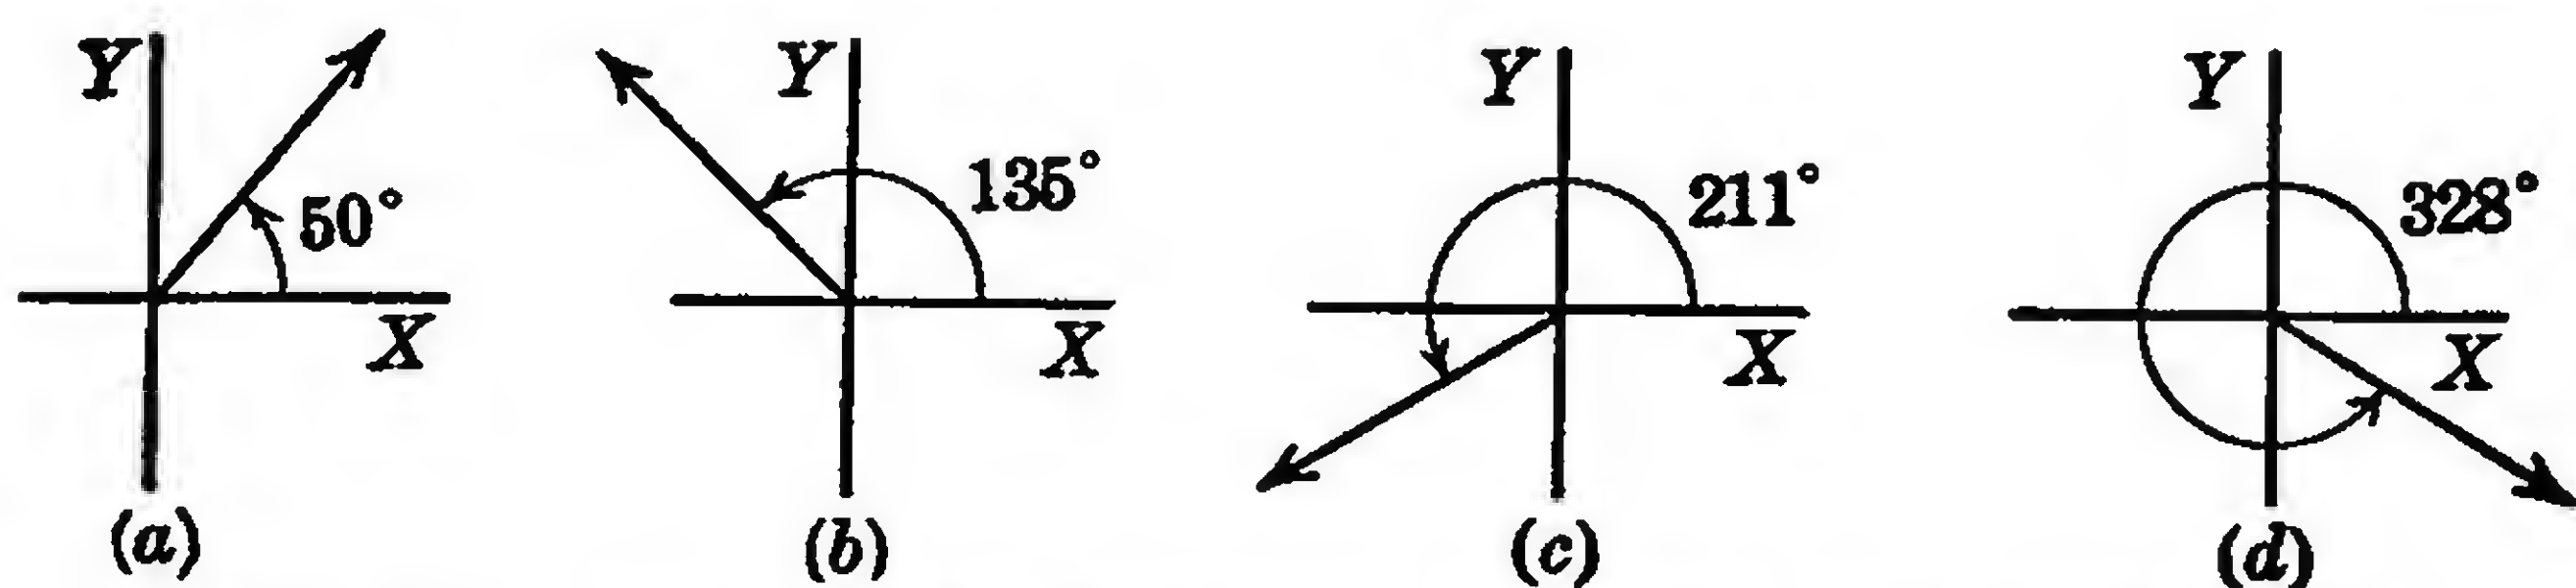

FIG. 16.—Vectors in the first, second, third, and fourth quadrants.

Since the resultant of two vectors can be added to another vector geometrically, it is possible to add any number of vectors geometrically by the above scheme. Let us consider vectors  $A$ ,  $B$ , and  $C$ , as shown in Fig. 17. Resolving these vectors into their respective components gives  $A_x$ ,  $A_y$ ,  $B_x$ ,  $B_y$ ,  $C_x$ , and  $C_y$  along the two axes.  $A_x$  and  $C_y$  are the only negative components, and hence they must be subtracted from the others when added algebraically. The horizontal components along the  $x$ -axis give  $A_x + B_x + C_x$  and the vertical components along the  $y$ -axis gives  $A_y + B_y + C_y$ . In writing the algebraic expression all signs are positive but, as in this example, when numerical values are substituted some of these terms ( $A_x$  and  $C_y$ ) will be negative. The geometric sum of vectors  $A$ ,  $B$ , and  $C$  is given by the resultant magnitude of vector  $R$ , thus

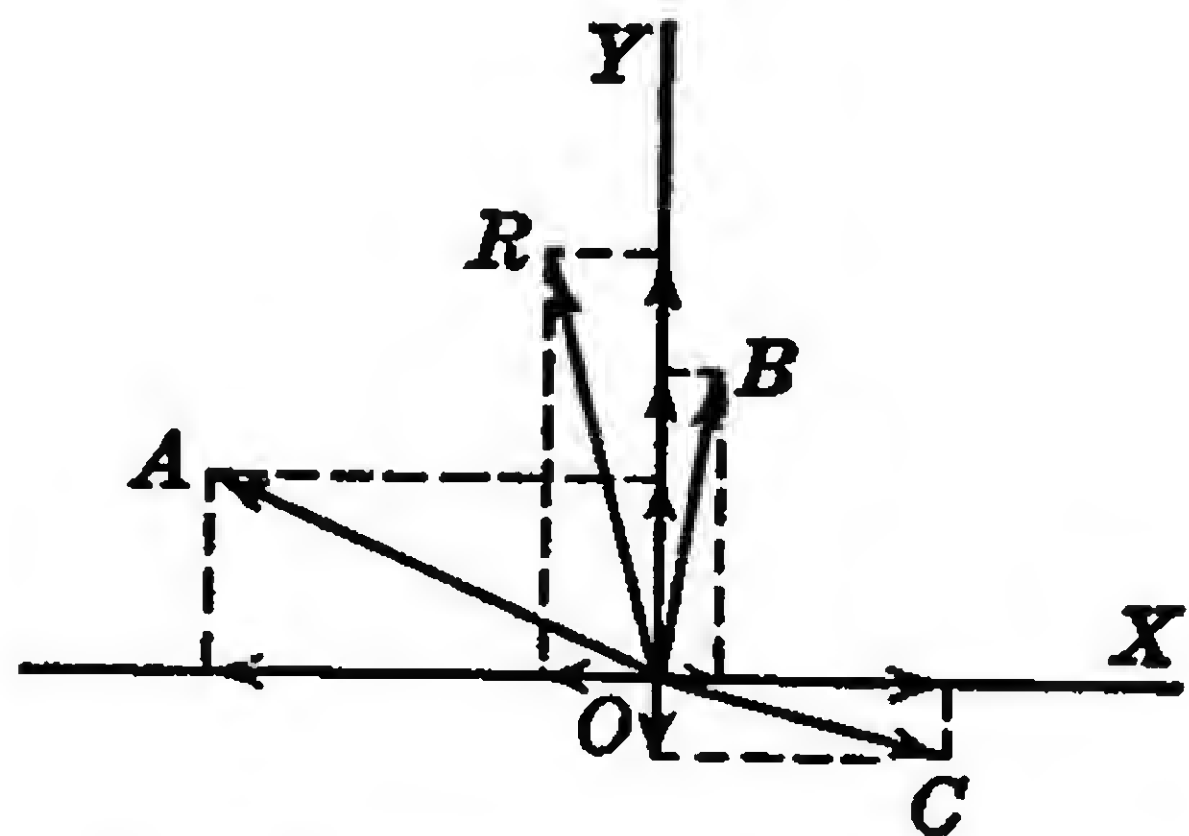

FIG. 17.—Geometric addition of three vectors.

$$|R| = \sqrt{(A_x + B_x + C_x)^2 + (A_y + B_y + C_y)^2} \quad (5)$$

This scheme can be extended to add geometrically any number of vectors. We must remember that *each vector must be resolved into its two components* along the  $x$ -axis and the  $y$ -axis. Vectors along the axis in the same direction are added arithmetically and those in the opposite direction are subtracted. To illustrate.

if the magnitude of  $A_x = 6$ ,  $B_x = -8$ ,  $C_x = 4$ , and  $D_x = -1$  are the components of  $A$ ,  $B$ ,  $C$ , and  $D$  along the  $x$ -axis, the algebraic sum gives the magnitude

$$A_x + B_x + C_x + D_x = 6 - 8 + 4 - 1 = 1$$

These vectors are shown in Fig. 18.

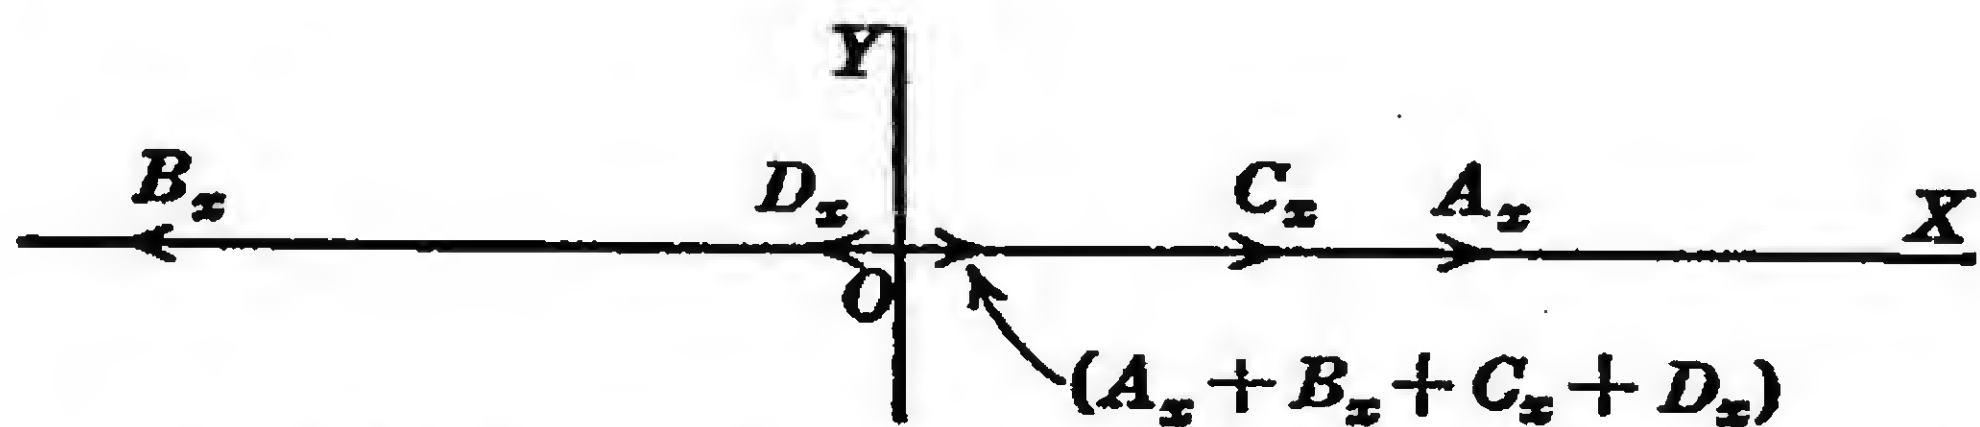

FIG. 18.—Algebraic addition of four vector components along the  $x$ -axis.

In order to classify the directions of vectors acting on a point the circle is divided into *four quadrants* as shown in Fig. 19. This is easier than stating the angle in degrees between the vector and the base line (positive  $x$ -axis). The first quadrant extends from 0 to 90 degrees, between the positive  $y$ -axis and the positive  $x$ -axis. The second quadrant extends from 90 to 180 degrees between the positive  $y$ -axis and the negative  $x$ -axis. The third quadrant extends from 180 to 270 degrees between the

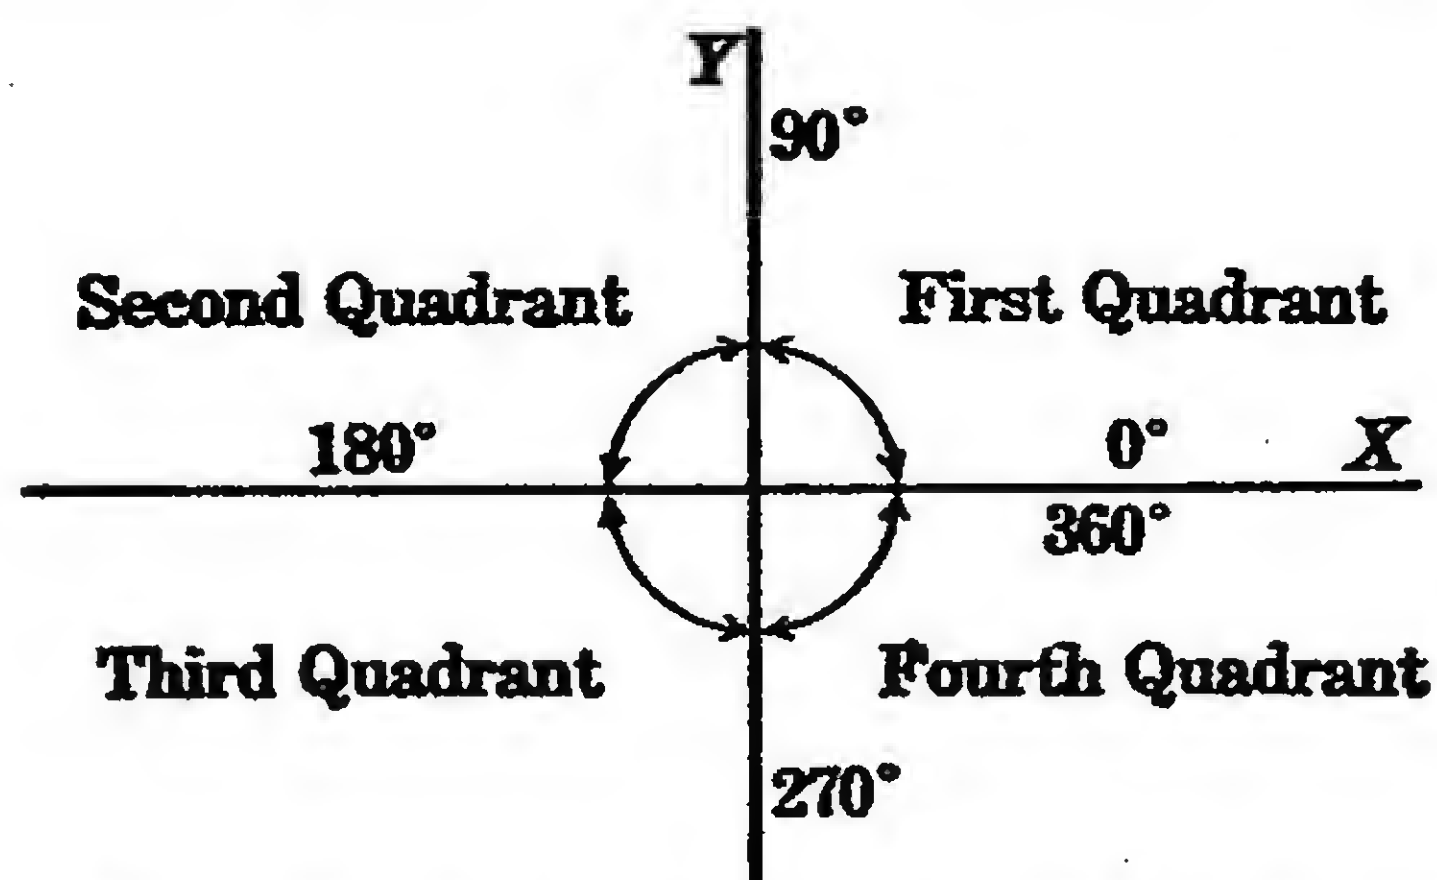

FIG. 19.—The four quadrants of a circle.

negative  $x$ -axis and the negative  $y$ -axis. The fourth quadrant extends from 270 to 360 degrees between the negative  $y$ -axis and the positive  $x$ -axis. The 360 degree line coincides with the 0 degree line or the positive  $x$ -axis; the 90 degree line coincides with the positive  $y$ -axis; the 180 degree line coincides with the negative  $x$ -axis and the 270 degree line coincides with the negative  $y$ -axis.

In Fig. 16, diagram *a* illustrates a vector in the first quadrant, diagram *b* illustrates a vector in the second quadrant, diagram

*c* illustrates a vector in the third quadrant, and diagram *d* illustrates a vector in the fourth quadrant.

*Example 5.* Vectors *A*, *B*, and *C* have the following components:

$$A_x = 10, A_y = 26, B_x = -20, B_y = -20, C_x = 6, C_y = -3.$$

Determine:

1. The components of the resultant vector *R*.
2. The quadrant of each vector.
3. The magnitude of each vector. (four-place accuracy)

*Solution.*

$$\begin{aligned} 1. R_x &= A_x + B_x + C_x \\ &= 10 - 20 + 6 = -4 \end{aligned}$$

$$\begin{aligned} R_y &= A_y + B_y + C_y \\ &= 26 - 20 - 3 = 3 \end{aligned}$$

2. *A* is in the first quadrant.  
*B* is in the third quadrant.  
*C* is in the fourth quadrant.  
*R* is in the second quadrant.

$$\begin{aligned} 3. |A| &= \sqrt{A_x^2 + A_y^2} = \sqrt{10^2 + 26^2} = 27.86 \\ |B| &= \sqrt{B_x^2 + B_y^2} = \sqrt{(-20)^2 + (-20)^2} = 28.28 \\ |C| &= \sqrt{C_x^2 + C_y^2} = \sqrt{6^2 + (-3)^2} = 6.04 \\ |R| &= \sqrt{R_x^2 + R_y^2} = \sqrt{(-4)^2 + 3^2} = 5 \end{aligned}$$

**Summary.**—The resultant of a group of vectors (forces, voltages, impedances, etc.) is obtained by the following procedure:

First, draw a diagram showing the vectors to be added geometrically, drawn from a common point *O*, the origin. This diagram should represent the magnitude of these vectors to a convenient scale and the actual direction with their angle designated.

Second, draw perpendiculars from the extreme end of each vector to the *x*-axis and the *y*-axis. Mark these components with the vector subscribed with *x* or *y* as the case may be.

Third, add algebraically the *x*-components together and the *y*-components together.

Fourth, determine the magnitude of the resultant by

$$|R| = \sqrt{\left( \begin{array}{c} \text{algebraic sum} \\ \text{of } x\text{-components} \end{array} \right)^2 + \left( \begin{array}{c} \text{algebraic sum} \\ \text{of } y\text{-components} \end{array} \right)^2}$$

If one component of a vector is known the other component can be easily determined, for if the magnitude

$$|A| = \sqrt{A_x^2 + A_y^2} \quad \text{then} \quad A_x = \sqrt{|A|^2 - A_y^2} \quad \text{and} \quad A_y = \sqrt{|A|^2 - A_x^2}$$

The reader should go through this development. ~~However~~, if the vector and its angle are given, the problem must be worked out graphically with a rule and protractor by means of the parallelogram law. Simple trigonometry is valuable to work this type of problem, for by means of it the  $x$ - and  $y$ -components are readily obtained. This type of problem will be treated in the next chapter.

### Exercises

#### 1. Right triangles.

a. Altitude = 40.

Base = 30.

Find the hypotenuse.

c. Altitude = 5.

Hypotenuse = 7.07.

Find the base.

e. Base = 1.3.

Hypotenuse = 1.7.

Find the altitude.

b. Altitude = 5.

Base = 8.66.

Find the hypotenuse.

d. Altitude = 18.

Hypotenuse = 30.

Find the base.

f. Base = 678.

Hypotenuse = 843.

Find the altitude.

2. In each of the following examples, find the resultant vector and state in which quadrant it lies. The directions of the vectors are along the  $x$  and  $y$  axes as shown in Fig. 20. The magnitude of the vectors, if drawn to scale such as 10 to 1, 20 to 1, 100 to 1, etc., on a large sheet of paper, will help you to understand the problem clearly and solve it correctly.

a.  $|A| = 6$ ,  $|B| = 10$ .

$|C| = 14$ ,  $|D| = 11$ .

b.  $|A| = 49$ ,  $|B| = 99$ .

$|C| = 391$ ,  $|D| = 441$ .

c.  $|A| = 7.0$ ,  $|B| = 3.4$ .

$|C| = 9.9$ ,  $|D| = 16.3$ .

d.  $|A| = 900$ ,  $|B| = 750$ .

$|C| = 1,325$ ,  $|D| = 475$ .

e.  $|A| = 0.2$ ,  $|B| = 0.6$ .

$|C| = 0.1$ ,  $|D| = 0.45$ .

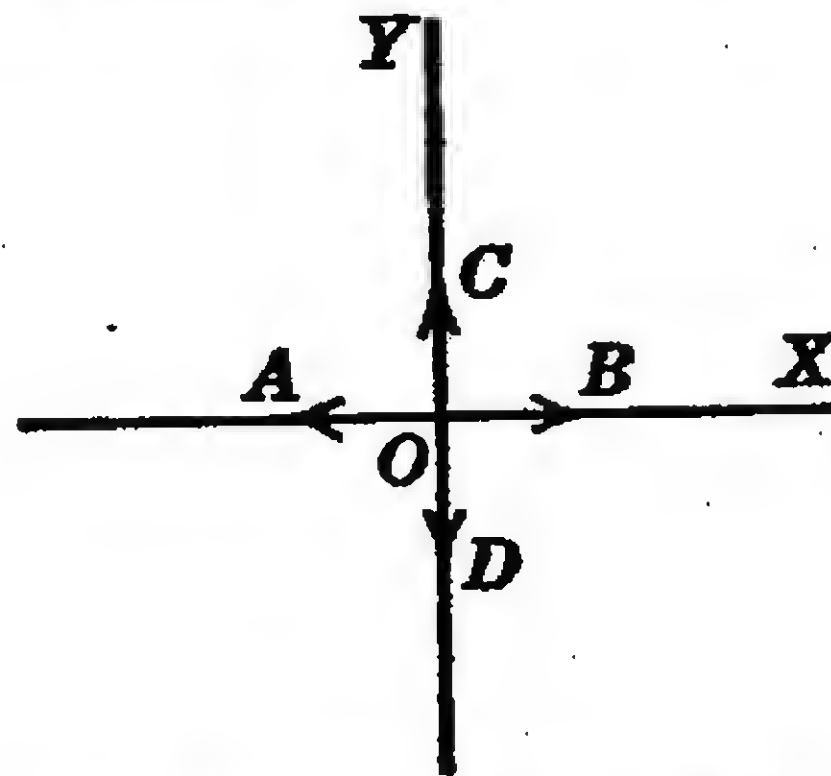

FIG. 20.—Direction of vectors in exercise problem 2.

3. In each of the following problems draw a vector diagram (not necessarily to scale) showing the various vectors, their component magnitudes along the  $x$ - and  $y$ -axis, and the resultant:

a.  $|A| = 100$ ,  $A_x = 86.6$ ,  $|B| = 100$ ,  $B_x = 70.7$  (vectors  $A$  and  $B$  in the first quadrant).

b.  $|A| = 60$ ,  $A_x = 30$ ,  $|B| = 80$ ,  $B_x = 60$  (vectors  $A$  and  $B$  in the second quadrant).

c.  $|A| = 1.2$ ,  $A_x = 1.2$ ,  $|B| = 3.2$ ,  $B_x = 1.6$  (vector  $A$  in first quadrant, vector  $B$  in fourth).

d.  $|A| = 8$ ,  $A_x = 6$ ,  $|B| = 3$ ,  $B_x = 2$  (vector  $A$  in second quadrant, vector  $B$  in fourth).

- e.  $|A| = 340$ ,  $A_y = 100$ ,  $|B| = 180$ ,  $B_x = 80$  (vector  $A$  in third quadrant, vector  $B$  in first).
- f.  $|A| = 400$ ,  $A_y = 150$ ,  $|B| = 500$ ,  $B_x = 250$ ,  $|C| = 300$ ,  $C_x = 200$  (vector  $A$  in first quadrant, vector  $B$  in second, and vector  $C$  in third).

*Note:* All the  $x$ - and  $y$ -components are expressed as positive numbers in the problems above. The actual sign is to be determined by the student from a knowledge of the quadrant in which the vector lies.

## CHAPTER 5

### TRIGONOMETRY

In the last chapter we learned how to resolve a vector or force into its horizontal component along the  $x$ -axis and its vertical component along the  $y$ -axis. After this operation had been performed to each vector to be added, the algebraic sum of the  $x$ -components gave a resultant  $x$ -component and the algebraic sum of the  $y$ -components gave a resultant  $y$ -component. The hypotenuse of the triangle formed by the resultant  $x$ -component and the resultant  $y$ -component is called the geometric or vector sum of all the vectors or forces added. But this gives us no information concerning the value of the angles in this triangle. We also mentioned in the last chapter a problem that had an angle given, but we could not solve it with the tools we then had.

*Trigonometry is the tool that deals with the angles of a right triangle and their relationship to the sides of the triangle.* If we have one angle and one side of a right triangle given, we can determine the other two sides and angle by using simple trigonometry. We can now appreciate the value of this new tool and how by its use we can solve practical vector problems involving forces, impedances, voltages, currents, etc.

**Trigonometric Functions.**—Trigonometry deals with what are known as “trigonometric functions” of the angle. Such a function is a ratio between two sides of the right triangle.

In Fig. 21, a line is drawn through the point  $O$  at an angle  $\alpha$  (alpha) with the horizontal line the  $x$ -axis. At some point  $R_1$  on this line drop a perpendicular to  $X_1$  on the  $x$ -axis. This perpendicular of course, cuts the  $x$ -axis at right angles, and we have the right triangle with sides  $a$ ,  $b$ , and  $c$ . In this right triangle it is possible to make three different ratios of the sides, that is,  $a/b$ ,  $c/b$ , and  $c/a$ .

Now, let us take some other point  $R_2$  on this line and drop another perpendicular to  $X_2$  on the  $x$ -axis. In this case we have formed another right triangle with sides  $A$ ,  $B$ , and  $C$ . It is

also possible in this triangle to form the different ratios of the sides, that is,  $A/B$ ,  $C/B$ , and  $C/A$ .

We could continue to drop more perpendiculars from this line to the  $x$ -axis, forming more triangles, but the results would not be different, so we will consider the two right triangles  $abc$  and  $ABC$ . If we compare these ratios it will be found that  $a/b$  is the same as  $A/B$ , that  $c/b$  is the same as  $C/B$ , and that  $c/a$  is the same as  $C/A$ . Referring to Fig. 21, we find that both sides  $A$  and  $B$  are straight lines. Therefore, a proportion exists such that if a point is moved a unit distance along the side  $B$  it moves to the right a proportional amount, which if extended by a perpendicular to the  $x$ -axis, cuts off the proportional distances on the  $x$ -axis. Similarly, the movement of this point a unit distance along the side  $B$  raises the point a proportional distance

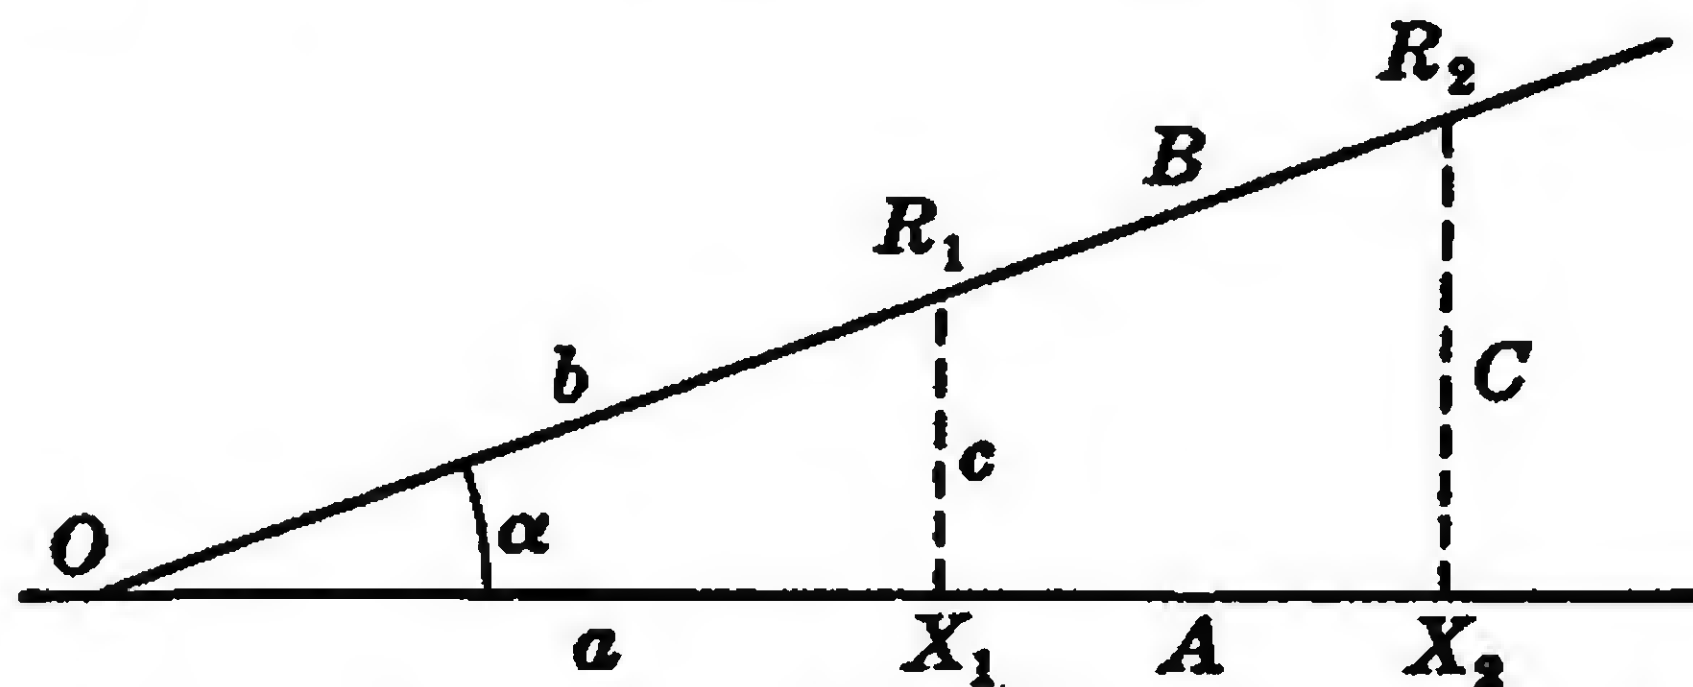

FIG. 21.—Relationship between similar triangles.

which in the above example was measured by  $c$  and  $C$ . The important thing to see, however, is that when these ratios are equal, regardless of the size of the right triangle, the corresponding angles of the two triangles are also equal. The triangles are said to be “similar” triangles.

If we are given a voltage  $V_1$  and the ratio between it and another voltage  $V_2$ , it is easy to find the other voltage. For instance, if  $V_1 = 10$  volts and we know that  $V_2$  is five times as large as  $V_1$ , then  $V_2 = 50$  volts. Mathematically, we say

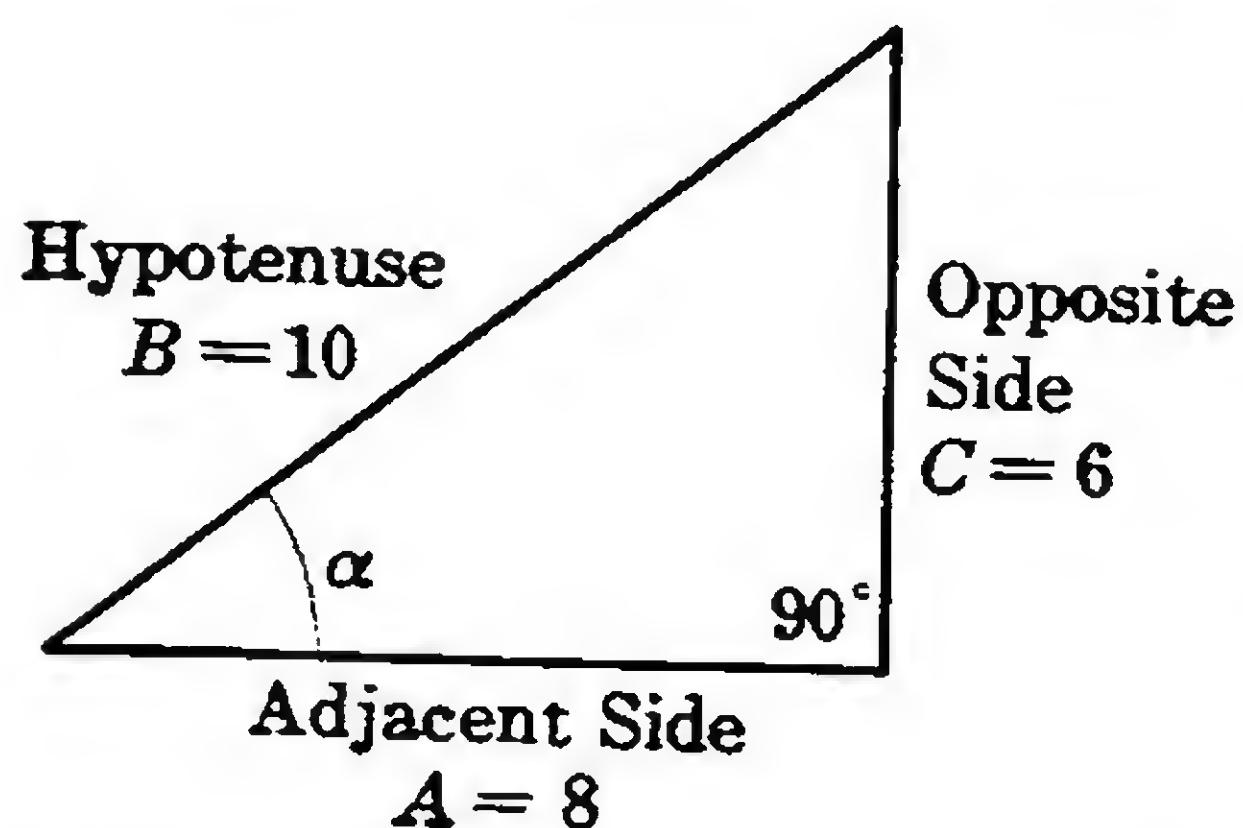

$$\text{Ratio} = \frac{V_2}{V_1} = \frac{50}{10} = 5$$

Now if we have the ratio of  $a$  to  $b$  equal to one third and know that  $b$  is 27, then  $a$  must be 9. Since the ratios of the sides of a right triangle remain fixed for a given angle, we can find the other sides of this triangle if we know the various ratios and one side.

If we have any two straight lines intersecting to make some angle  $\alpha$ , it is always possible to drop a perpendicular from a point on one line to the other and the result will then be a right triangle.

In this right triangle we have the *hypotenuse* (the longest side, which is always opposite the right angle); the *adjacent side* (the side next to the angle in question); and the *opposite side* (the side opposite the angle in question). In Fig. 21, the hypotenuse of triangle  $abc$  is  $b$ , the adjacent side is  $a$  and the opposite side is  $c$ . In triangle  $ABC$  the hypotenuse is  $B$ , the adjacent side is  $A$  and the opposite side is  $C$ .

Since the ratios hold the same for a given angle regardless of the length of the three sides, we can always form this angle by

$$\begin{aligned}\text{Ratio } \frac{A}{B} &= \frac{\text{adjacent side}}{\text{hypotenuse}} = \frac{8}{10} = 0.8 \\ \text{Ratio } \frac{C}{B} &= \frac{\text{opposite side}}{\text{hypotenuse}} = \frac{6}{10} = 0.6 \\ \text{Ratio } \frac{C}{A} &= \frac{\text{opposite side}}{\text{adjacent side}} = \frac{6}{8} = 0.75\end{aligned}$$

FIG. 22.—Names of the sides of a right triangle with respect to the acute angle  $\alpha$ .

other sides if the length of one side is given. This can be applied to any other triangle having the same angle and, provided one side is known, the other sides can be determined. Figure 22 represents the relations discussed in this paragraph.

Now, if we have another triangle with the same angle  $\alpha$  and the adjacent side equal to 40, the other two sides can be determined from the above ratios.

This problem is shown in Fig. 23. From the above problem we know that the ratio  $A/B = 0.8$  where  $A = 40$ . Solving, we get  $B = 50$ , the length of the hypotenuse. From the ratio  $C/A = 0.75$  we can solve for  $C$  and get  $C = 30$ , the length of the opposite side. To prove this we can take the other ratio

$$C/B = 30/50 = 0.6$$

which checks with the ratio obtained above for this case.

using a protractor to determine the correct angle between two intersecting straight lines. Now, drop a perpendicular from a point on one of the lines to the other line to complete the right triangle. The three sides of the triangle can then be measured and the ratios worked out from these measurements. This will result in the following ratios: *adjacent side to hypotenuse*, *opposite side to hypotenuse*, and *opposite side to adjacent side*. Knowing the angle and ratios, we can determine the length of the

This type of problem can always be worked graphically by using a rule and protractor as outlined above. For that matter, a table of these ratios could be made in this manner for all angles from 0 to 90 degrees, but there is no need of this, since they have been computed very accurately and compiled in mathematical tables called "natural trigonometric functions of angles" or natural sines, cosines, and tangents.

When speaking about the trigonometric functions of an angle, we are talking in terms of right triangles as discussed above, but it is not always necessary to draw in the perpendicular to form the opposite side.

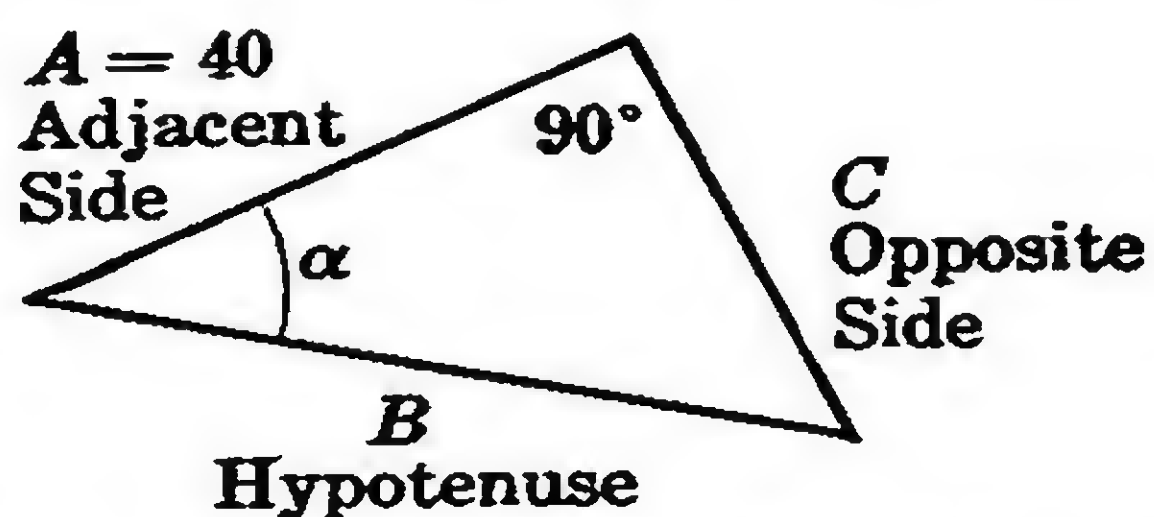

FIG. 23.—The names of the respective sides of a right triangle are not altered by its position.

**Definitions of Trigonometric Functions.**—In order to simplify expressions we define the ratios by giving them names, as follows:

$$\text{Cosine} = \left( \frac{\text{ratio of adjacent side to hypotenuse}}{\text{side to hypotenuse}} \right) = \frac{\text{adjacent side}}{\text{hypotenuse}} \quad (1)$$

$$\text{Sine} = \left( \frac{\text{ratio of opposite side to hypotenuse}}{\text{side to hypotenuse}} \right) = \frac{\text{opposite side}}{\text{hypotenuse}} \quad (2)$$

$$\text{Tangent} = \left( \frac{\text{ratio of opposite side to adjacent side}}{\text{side to adjacent side}} \right) = \frac{\text{opposite side}}{\text{adjacent side}} \quad (3)$$

The reciprocal of these ratios gives three other functions, as follows:

$$\text{Secant} = \left( \frac{\text{ratio of hypotenuse to adjacent side}}{\text{to adjacent side}} \right) = \frac{\text{hypotenuse}}{\text{adjacent side}} \quad (4)$$

$$\text{Cosecant} = \left( \frac{\text{ratio of hypotenuse to opposite side}}{\text{to opposite side}} \right) = \frac{\text{hypotenuse}}{\text{opposite side}} \quad (5)$$

$$\text{Cotangent} = \left( \frac{\text{ratio of adjacent side to opposite side}}{\text{side to opposite side}} \right) = \frac{\text{adjacent side}}{\text{opposite side}} \quad (6)$$

These last three functions can always be replaced by the first three, and since they are used very seldom they will not be treated here. However, they can be found in tables and used just like the other functions in problems. Instead of writing out the whole word for these functions they are usually abbreviated as follows:

Sine = sin	Cosecant = csc
Cosine = cos	Secant = sec
Tangent = tan	Cotangent = cot

**Value of Function as the Angle Varies.**—The above relationships can be associated with the radius of a circle as it moves around the circle making a varying angle with a fixed line called the “base line” or “positive  $x$ -axis,” as shown in Fig. 24.

The hypotenuse of the triangle in any event is the radius of the circle and is always the same length. As it rotates from its position  $oa$  on the  $x$ -axis to the position  $oe$  on the  $y$ -axis, the angle it makes with the  $x$ -axis varies from 0 to 90 degrees.

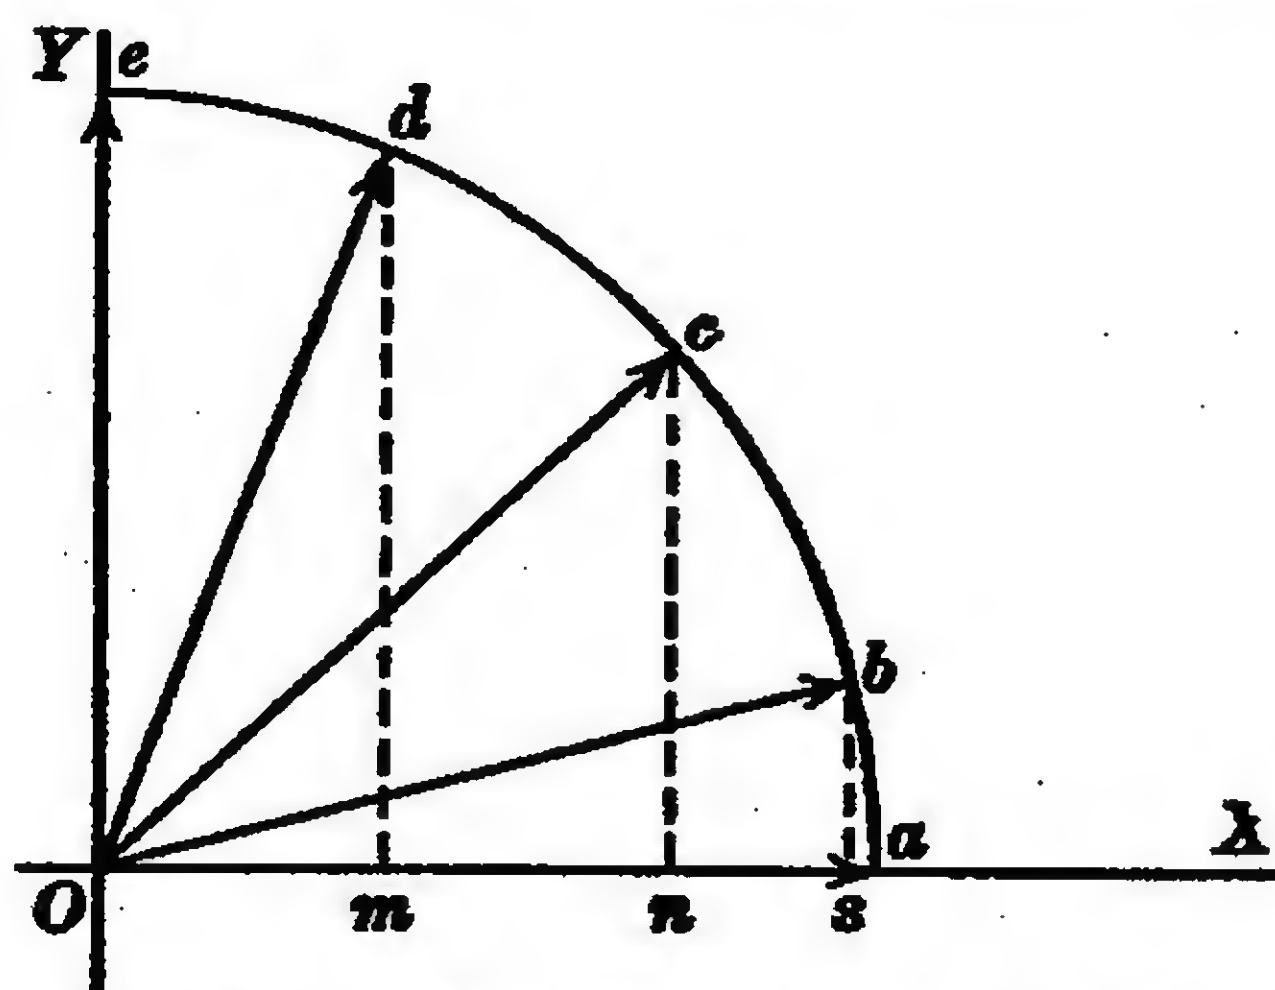

FIG. 24.—Value of trigonometric functions vary as the hypotenuse of a triangle traces the arc of a circle.

In the position  $oa$ , the hypotenuse coincides with the adjacent side and is equal to it, while the opposite side is zero. In this case the ratio of the adjacent side to the hypotenuse is 1 ( $\cos 0^\circ = 1$ ), and the ratio of the opposite side to the hypotenuse is zero ( $\sin 0^\circ = 0$ ), and the ratio of the opposite to the adjacent side is also zero ( $\tan 0^\circ = 0$ ). *Note:* Zero divided by any number is zero.

In the position  $oe$ , the hypotenuse coincides with the opposite side and is of the same length, the length of the adjacent side being zero. Then the ratio of the opposite side to the hypotenuse is 1 ( $\sin 90^\circ = 1$ ), the ratio of the adjacent side to the hypotenuse is zero ( $\cos 90^\circ = 0$ ), and the ratio of the opposite side to the adjacent side is infinity ( $\tan 90^\circ = \infty$ ). *Note:* Any number divided by zero gives infinity, which is larger than any number, much as zero is smaller than any number. Zero and infinity are

really not numbers and hence must not be handled as numbers in mathematical operations.

If the hypotenuse (radius) is made of unit length, the ratio of the adjacent side to the hypotenuse is equal to the length of the adjacent side and the ratio of the opposite side to the hypotenuse is equal to the length of the opposite side.

Referring to Fig. 24, we can see that the adjacent side decreases from  $oa$ , which is 1, to  $os$  when the hypotenuse is in the position  $ob$ . As the hypotenuse takes on the positions  $oc$ ,  $od$ , and lastly  $oe$  the adjacent side decreases from  $no$  to  $mo$  and then finally becomes of zero length. This means that the *cosine* of the angle varies from unity for 0 degrees to zero for 90 degrees, *decreasing* as the angle *increases*.

The opposite side is of zero length when the hypotenuse is in position  $oa$  and increases to  $bs$  when the hypotenuse takes on the position  $ob$ . As the hypotenuse takes on the positions  $oc$ ,  $od$ , and finally  $oe$ , the opposite side increases in length from  $cn$  to  $dm$  and lastly is of unit length  $oe$ . This shows that the *sine* of the angle varies from zero at 0 degrees to unity at 90 degrees, *increasing* as the angle *increases*.

Consider the ratio of the opposite side to the adjacent side as the angle varies from 0 to 90 degrees. This ratio varies from 0 when the hypotenuse is in position  $oa$  to  $\infty$  (infinity) when the hypotenuse is in position  $oe$ . When the hypotenuse makes an angle of 45 degrees with the  $x$ -axis this ratio is unity, so the tangent of the angle varies from zero to unity in the first 45 degrees and from unity to infinity in the next 45 degrees. The *tangent* of the angle *increases* as the angle *increases*.

It is of interest to note that the sine and cosine, opposite and adjacent sides in Fig. 24, never grow larger than the hypotenuse, which is 1, but the tangent, which is the ratio of the opposite side to the adjacent side, or sine to cosine, has both terms in the ratio varying. The opposite side grows larger while the adjacent side grow smaller. The result is that the tangent grows larger rather slowly up to 45 degrees but then grows larger rapidly as the angle increases to 90 degrees. In the case of the sine and cosine, only one term in the ratio varied.

The student should now inspect a table of trigonometric functions (a brief table is at the back of this book). These functions may be listed as natural sines and cosines in one table

and natural tangents and cotangents in the other table. The investigation of these tables should verify the above discussion.

When the student is in doubt about trigonometric functions it will often help to draw a figure of a quadrant, as in Fig. 24. Other aids are given on page 304.

In trigonometric tables, angles up to 90 degrees only are given. That is one reason for dividing the circle into four 90-degree quadrants. In case an angle between 90 and 180 degrees is given, the trigonometric function of that angle is equal to 180 degrees minus the angle in question. Then this angle will be between 0 and 90 degrees. The rule is to *measure the angle to the nearest base line—that is, to the x-axis*. For an angle lying in the third quadrant subtract 180 degrees and then look this angle up in the tables. In the fourth quadrant, subtract the angle from 360 degrees, which will again give angles between 0 and 90 degrees. This shows that tables from 0 to 90 degrees are sufficient to handle any angle one may meet in practice.

As shown before, the trigonometric functions are expressed in terms of ratios. Each function can be expressed in three different ways by changing the equation. Using the abbreviations

hyp = hypotenuse	sin = sine of angle
adj = adjacent side	cos = cosine of angle
opp = opposite side	tan = tangent of angle

we can now write

$$\sin = \frac{\text{opp}}{\text{hyp}} \quad (7)$$

$$\text{hyp} = \frac{\text{opp}}{\sin} \quad (8)$$

$$\text{opp} = \sin \text{ hyp} \quad (9)$$

$$\cos = \frac{\text{adj}}{\text{hyp}} \quad (10)$$

$$\text{hyp} = \frac{\text{adj}}{\cos} \quad (11)$$

$$\text{adj} = \cos \text{ hyp} \quad (12)$$

$$\tan = \frac{\text{opp}}{\text{adj}} \quad (13)$$

$$\text{adj} = \frac{\text{opp}}{\tan} \quad (14)$$

$$\text{opp} = \text{adj} \tan \quad (15)$$

The above equations are valuable when solving for unknown sides or angles in a right triangle. If any two sides of a right triangle are given the angles can be found by using one of the above equations and then looking in a table of trigonometric functions for the angle.

*Example 1.* In Fig. 25 we have given  
 adjacent side  $a = 8$   
 hypotenuse  $c = 10$

Find

opposite side  $b$   
 angle  $\alpha$  (alpha)  
 angle  $\beta$  (beta)

*Solution.* By Eq. (10),

$$\cos \alpha = \frac{\text{adj}}{\text{hyp}} = \frac{a}{c} = \frac{8}{10} = 0.8$$

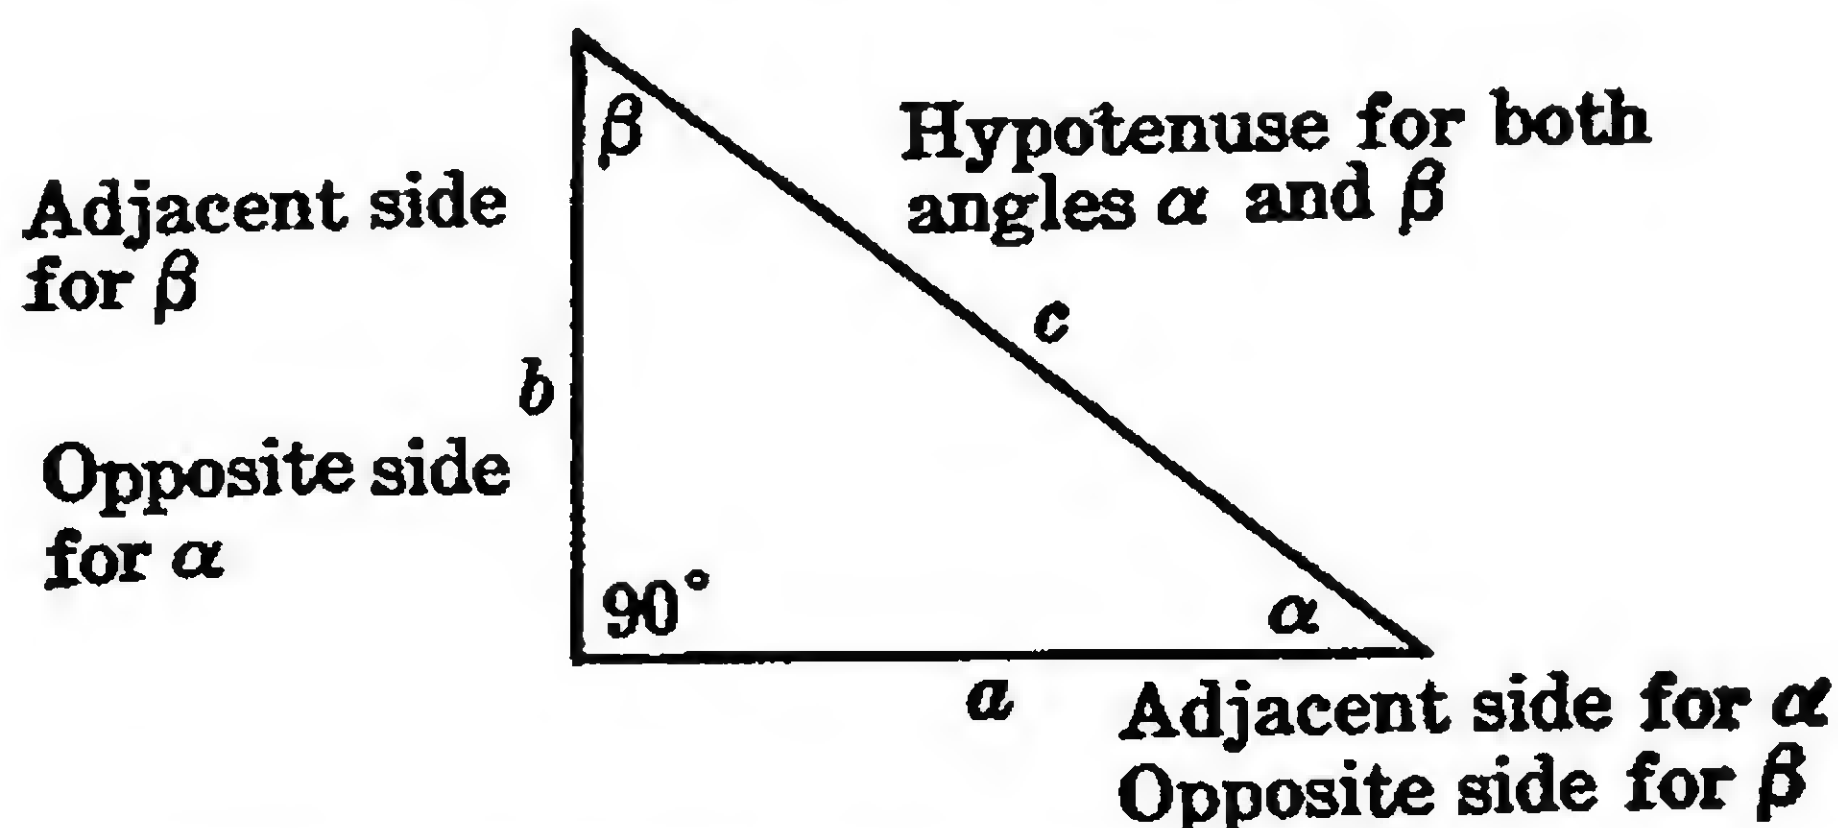

FIG. 25.—The names of the sides of a right triangle in terms of either acute angle.

Looking in a six-place trigonometric table, we find that the cosine of  $36^\circ 52'$  (36 degrees 52 minutes) gives 0.800034, which is close enough for practical purposes. Hence

$$\alpha = 36^\circ 52' \text{ Ans.}$$

The opposite side  $b$  can now be found by means of Eq. (9) or (15) given above. Using Eq. (9),

$$\begin{aligned} \text{opposite side } b &= \sin \alpha \text{ hyp} \\ &= (0.6)(10) \\ &= 6 \text{ Ans.} \end{aligned}$$

By application of Eq. (15),

$$\begin{aligned} \text{opposite side } b &= \tan \alpha \text{ adj} \\ &= (0.75)(8.0) \\ &= 6 \text{ Ans.} \end{aligned}$$

( $\tan \alpha$  was found for  $36^\circ 52'$  in the tables)

Angle  $\beta$  can be found by using Eq. (7), (10), or (13), but it must be remembered that when using angle  $\beta$  the adjacent side is  $b$  and the opposite

side is  $a$ . Using Eq. (7),

$$\sin \beta = \frac{\text{opp}}{\text{hyp}} = \frac{8}{10} = 0.8$$

Then, from the table,

$$\beta = 53^\circ 08' \text{ (nearly) } \textit{Ans.}$$

*Note:* This must be read up from the bottom of the page. The minutes are given on the right-hand side instead of the left-hand side when the angles at the top are used. (See Allen's "Six-place Tables.")

It will be noted that  $\cos \alpha = 0.8$  and  $\sin \beta = 0.8$ . This is due to the fact that *the sum of the interior angles of a triangle is 180 degrees*. Since we are using right triangles, one of these angles equals  $90^\circ$  and hence the sum of the other two angles equals  $180^\circ - 90^\circ = 90^\circ$ . This says that  $\alpha + \beta = 90^\circ$ , so if  $\alpha = 36^\circ 52'$ ,  $\beta = 90^\circ - \alpha = 90^\circ - 36^\circ 52' = 53^\circ 08'$ . Since the sum of  $\alpha$  and  $\beta$  is  $90^\circ$  they are called "complementary angles." That is, if one angle increases a certain amount the other angle must decrease the same amount and vice versa.

If one side and an angle of a right triangle are given it is possible to find the value of the other sides and angles by means of trigonometry.

*Example 2.* In Fig. 25, let  $b = 20$  and  $\alpha = 30^\circ$ . Find  $a$ ,  $c$ , and  $\beta$ .

*Solution.*

$$\text{Angle } \beta = 90^\circ - \alpha = 90^\circ - 30^\circ = 60^\circ \textit{ Ans.}$$

By Eq. (11) and the use of the trigonometric tables,

$$\begin{aligned} c = \text{hyp} &= \frac{\text{adj}}{\cos \beta} = \frac{b}{\cos \beta} \\ &= \frac{20}{\cos 60^\circ} = \frac{20}{0.5} = 40 \textit{ Ans.} \end{aligned}$$

By Eq. (15),

$$\begin{aligned} a = \text{opp} &= \text{adj} \tan \beta = 20 \tan \beta = (20)(1.732) \\ &= (20)(1.732) = 34.64 \textit{ Ans.} \end{aligned}$$

The work can easily be checked by using other equations such as Eq. (12), as follows:

$$\begin{aligned} \text{Substituting,} \quad \text{adj} &= \text{hyp} \cos \alpha \\ 34.64 &= (40)(\cos 30^\circ) \\ &= (40)(0.866) \\ &= 34.64 \textit{ Check.} \end{aligned}$$

Applying this knowledge of trigonometry, we are able to work the problems mentioned in the preceding chapter. In other words, if we have a vector or force with magnitude and direction given, it is a simple matter to find its components along the  $x$ -axis and the  $y$ -axis. This type of problem will be handled in the next chapter on vector addition.

**Inverse Trigonometric Functions.**—In logarithms we used the antilogarithm, which is the number corresponding to a certain logarithm. In trigonometry it is advantageous to use similar expressions. The angle corresponding to a given ratio can be expressed in three ways, as follows:

$$\begin{aligned}\tan^{-1} 0.5 &= 26^{\circ}34' \\ \sin^{-1} 0.5 &= 30^{\circ} \\ \cos^{-1} 0.5 &= 60^{\circ}\end{aligned}$$

These equations can be rewritten in the familiar form as follows:

$$\begin{aligned}\tan 26^{\circ}34' &= 0.5 \\ \sin 30^{\circ} &= 0.5 \\ \cos 60^{\circ} &= 0.5\end{aligned}$$

The student should not confuse the above forms  $\tan^{-1}$ ,  $\sin^{-1}$ , and  $\cos^{-1}$  with negative exponents—they are merely abbreviations to simplify the mathematics.

**Logarithms of Trigonometric Functions.**—Also, the student should not confuse logarithmic  $\sin$ ,  $\cos$ ,  $\tan$ , and  $\cot$  with the natural functions. This table (such as found in Allen's "Six-place Tables") of logarithmic trigonometric functions is merely a table of logarithms of ratios for use in problems when dealing with logarithms and will not be referred to in this book unless so specified.

### Exercises

In each of the following problems, construct the triangle, showing values of all the sides and angles. In solving them, use the equations on page 72 and the fact that the sum of the angles of a triangle equals  $180^{\circ}$ .

1. Hypotenuse = 60, angle =  $40^{\circ}$ .
2. Opposite side = 35, angle =  $25^{\circ}$ .
3. Adjacent side = 7.07, angle =  $45^{\circ}$ .
4. Adjacent side = 10, opposite side = 20.
5. Hypotenuse = 15, adjacent side = 5.
6. Opposite side = 50, hypotenuse = 90.

Each of the above problems should be checked by several other equations until the student is *positive* that he is familiar with each type of problem.

## CHAPTER 6

### VECTOR ADDITION

Already we have been using vectors in geometry but could not in all cases arrive at a solution until the principles of trigonometry were introduced. We are now ready to solve any such vector problems.

Reviewing, we remember that vectors in the same direction can be added arithmetically, vectors in the same direction or in exact opposition can be added algebraically, and vectors at right angles to each other can be added geometrically. Generalizing still another step, *vectors in any direction can be added vectorially.*

Perhaps the simplest geometric addition is when the two vectors are of equal magnitude and at right angles. In this case the resultant lies halfway between the two vectors (45 degrees from either one) and has a magnitude of

$$|R| = \sqrt{|a|^2 + |a|^2} = \sqrt{2a^2} = |a| \sqrt{2}$$

when  $a$  represents the magnitude of either vector. In words this says that the resultant magnitude is equal to the square root of the sum of the squares of the magnitudes of the two vectors. See Fig. 11 for a similar illustration.

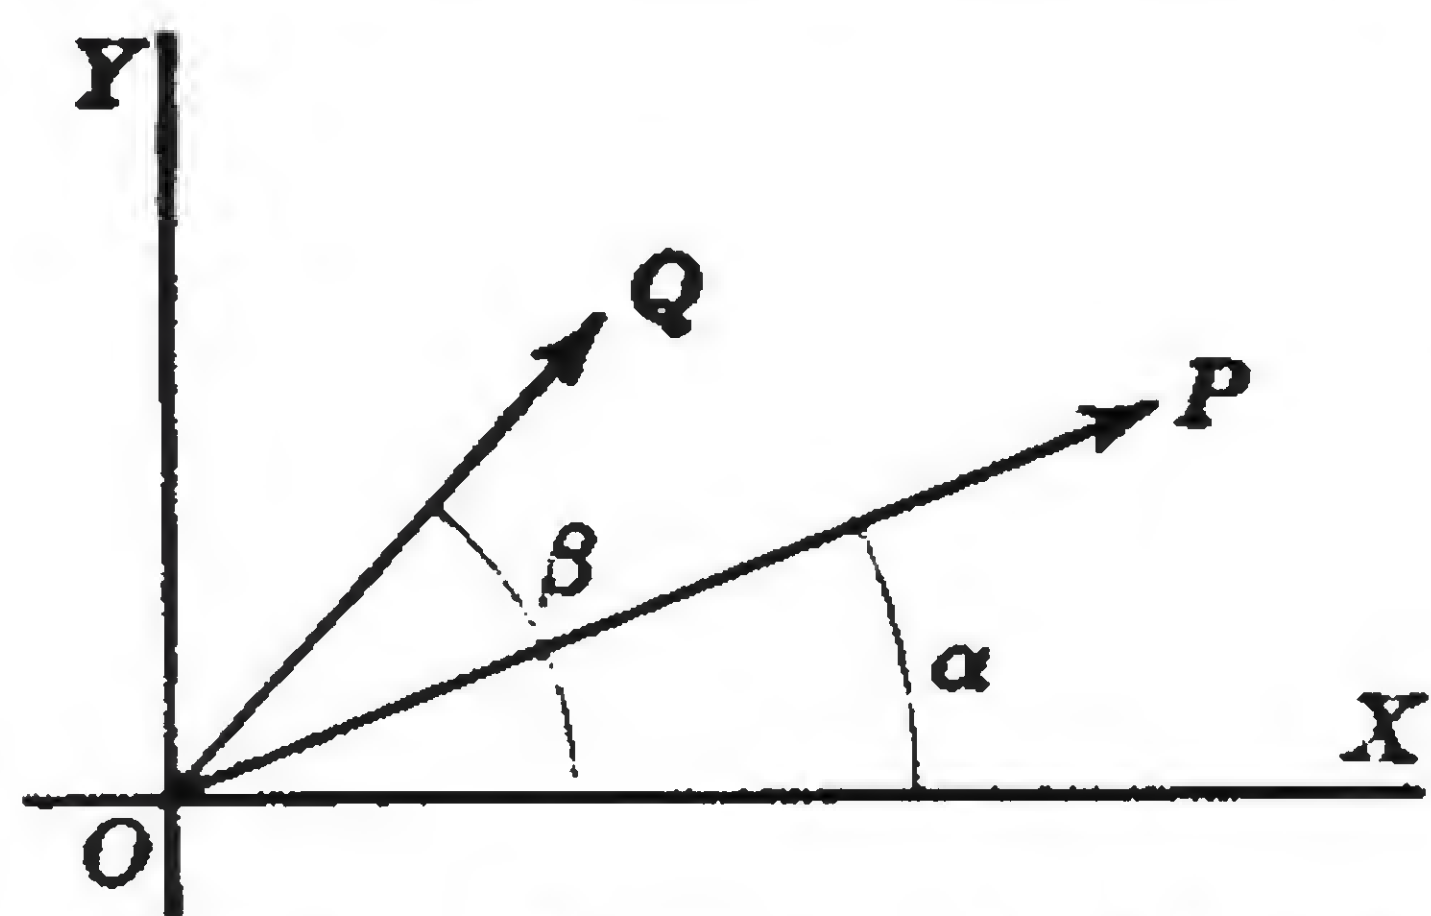

FIG. 26.—Vector forces  $P$  and  $Q$  acting on the point  $O$  at angles of  $\alpha$  and  $\beta$  respectively.

**Vectorial Addition.**—When the vectors are *not* at right angles, as illustrated in Fig. 26, it is customary to resolve the vectors into their components along the  $x$ -axis

and the  $y$ -axis. The algebraic sum of the  $x$ -components gives a resultant  $x$ -component and the algebraic sum of the  $y$ -component gives a resultant  $y$ -component. These resultant  $x$ - and  $y$ -components are added geometrically to obtain the resultant vector.

Graphically, the vectors  $P$  and  $Q$  are resolved into their components  $P_x$ ,  $P_y$ ,  $Q_x$  and  $Q_y$  as shown in diagrams  $a$  and  $b$  of

Fig. 27. If these two diagrams are superimposed the result shown in Fig. 27c is obtained. Here the resultant magnitude of the  $x$ -component is obtained by algebraic addition of the  $x$ -components, thus

$$\text{Sum of } x\text{-components} = R_x = P_x + Q_x \quad (1)$$

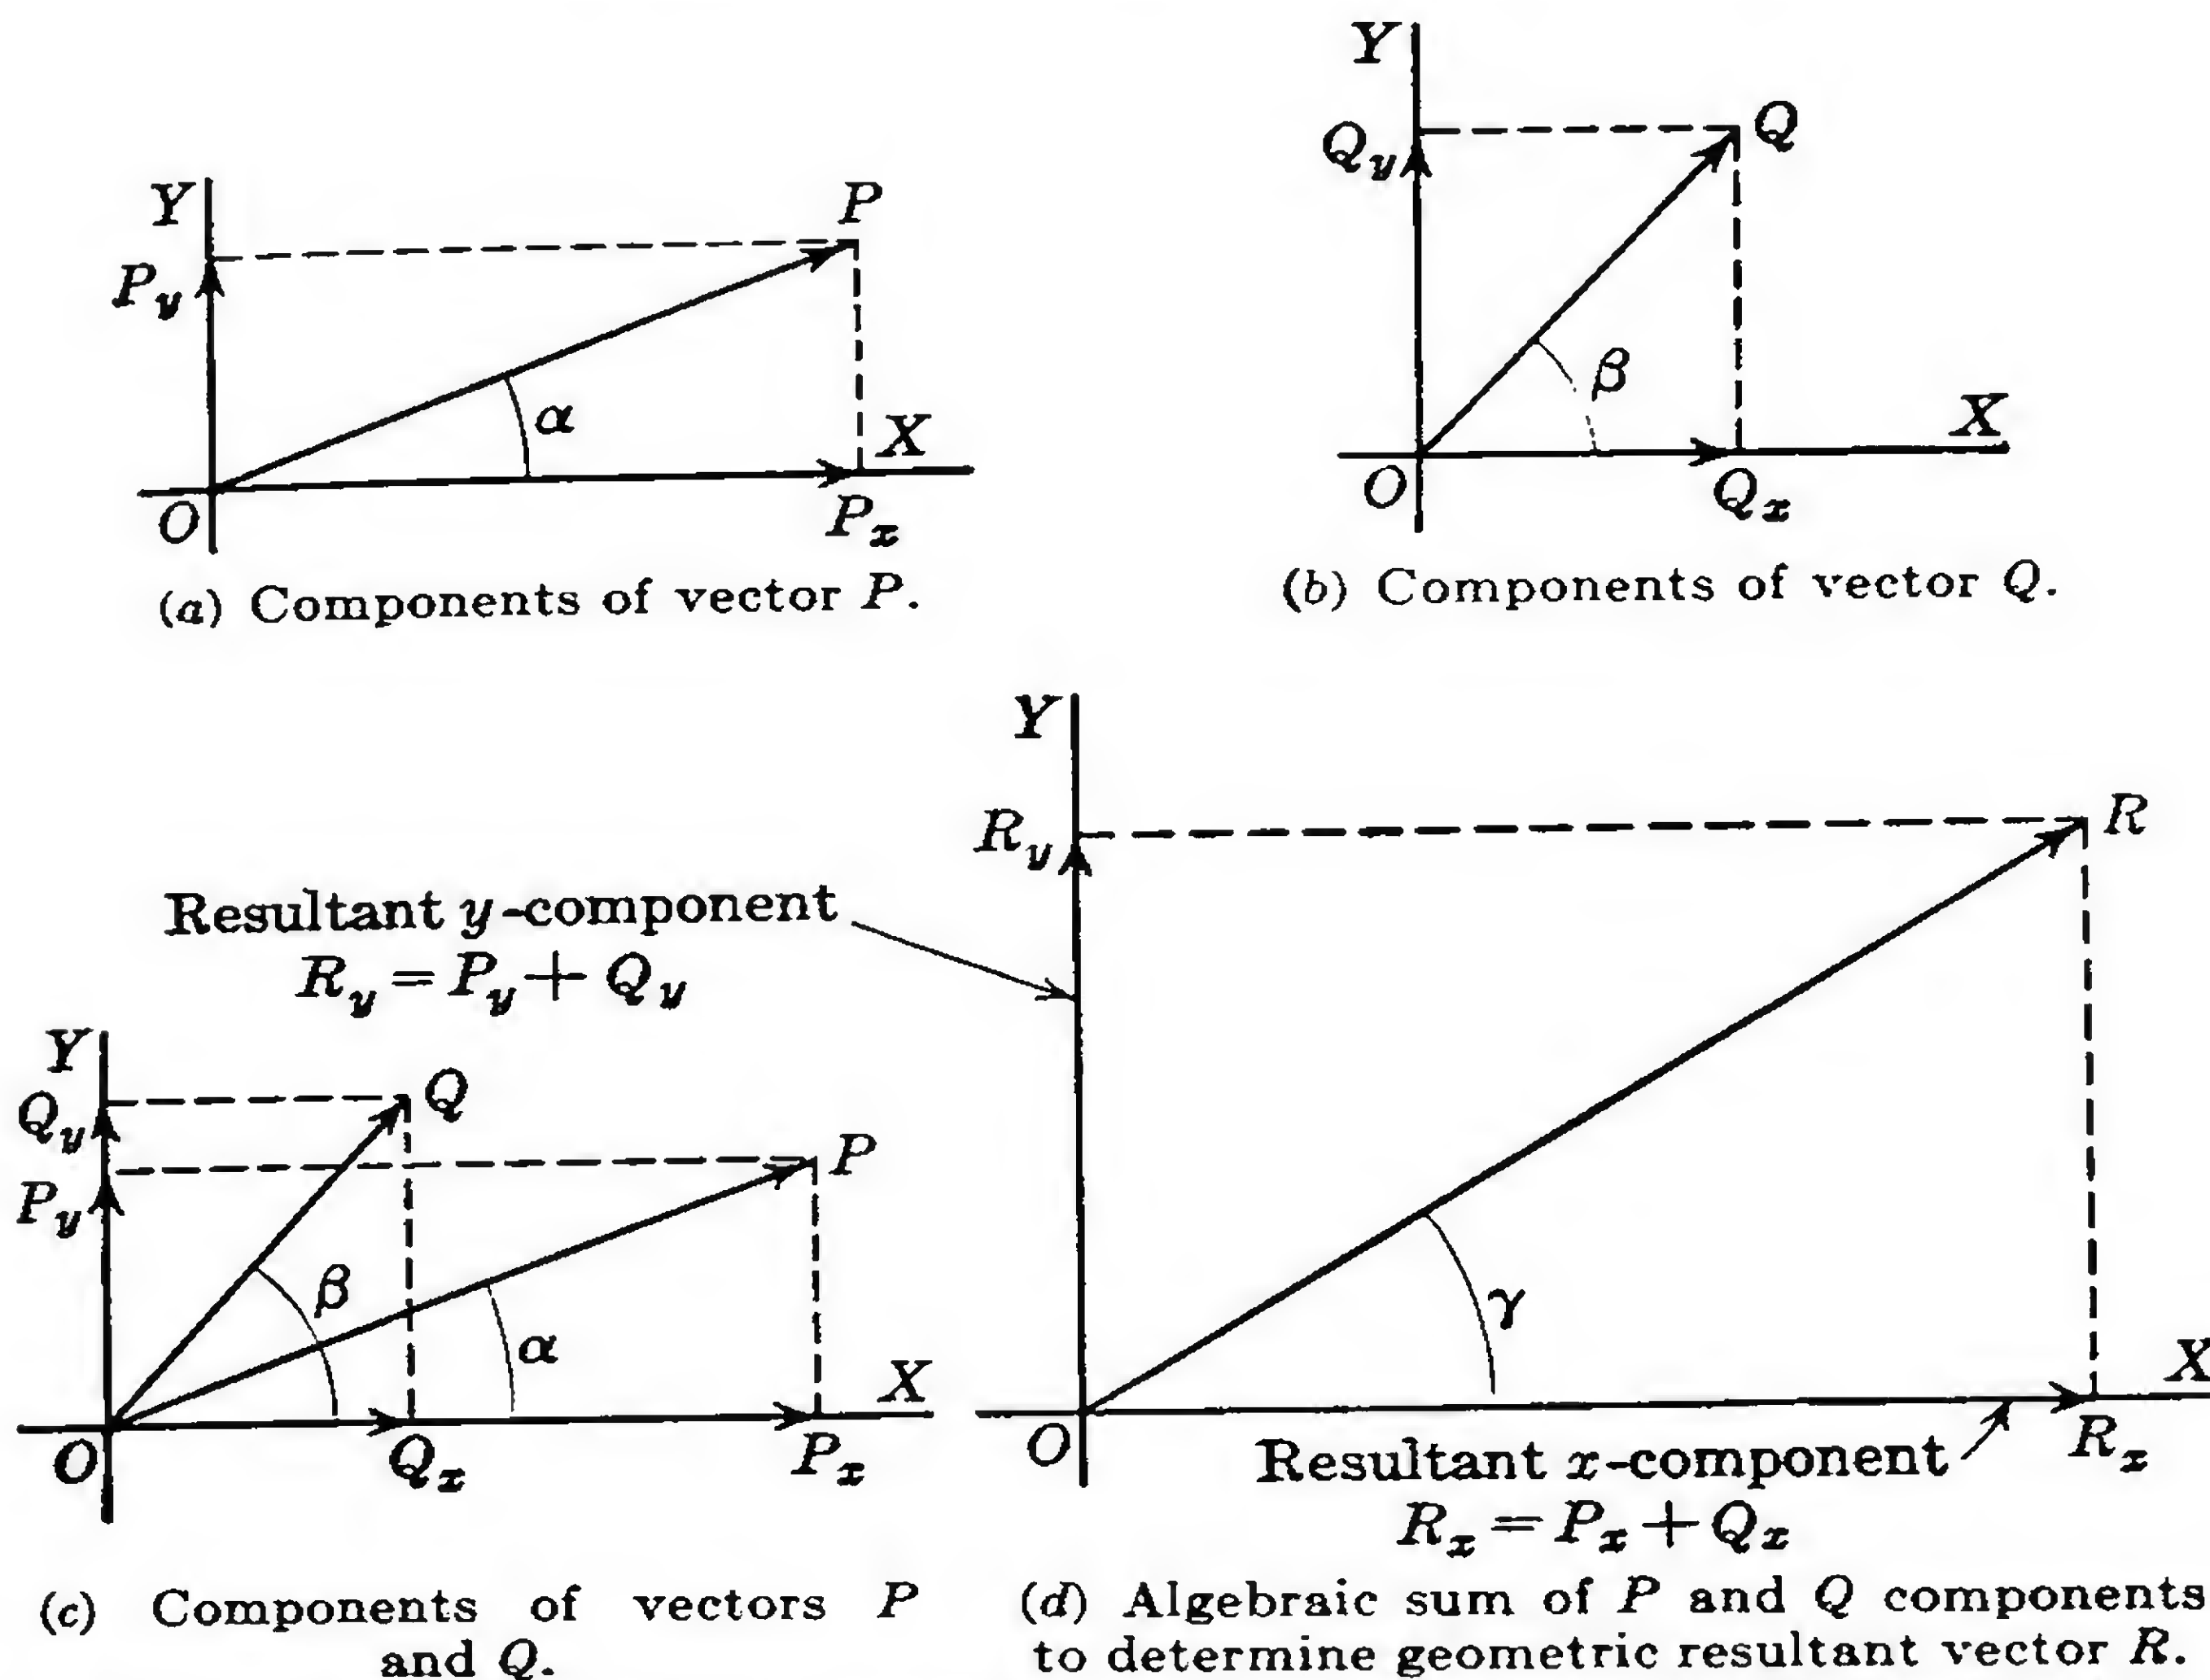

FIG. 27.—Steps in resolving vectors into their components, which are added geometrically to determine the resultant vector sum.

Similarly, the resultant magnitude of the  $y$ -component is obtained by algebraic addition of the  $y$ -components, thus

$$\text{Sum of } y\text{-components} = R_y = P_y + Q_y \quad (2)$$

The geometric sum of the resultant  $x$ - and  $y$ -components ( $R_x$  and  $R_y$ ) gives the resultant vector  $R$  as shown in Fig. 27c. Since vectors  $R_x$  and  $R_y$  are at right angles to each other the resultant magnitude can be written

$$|R| = \sqrt{R_x^2 + R_y^2} \quad (3)$$

Substituting for the magnitude of  $R_x$  and  $R_y$  in this equation we have the magnitude of the resultant

$$|R| = \sqrt{(P_x + Q_x)^2 + (P_y + Q_y)^2} \quad (4)$$

The complete graphical solution to the problem is shown in Fig. 28.

Since it is usually inconvenient to work problems out graphically, we shall proceed to solve this problem analytically by using our new tool, trigonometry.

Figure 27a shows that vector  $P$  makes an angle of  $\alpha$  with the  $x$ -axis. If a perpendicular is drawn from the extreme end of

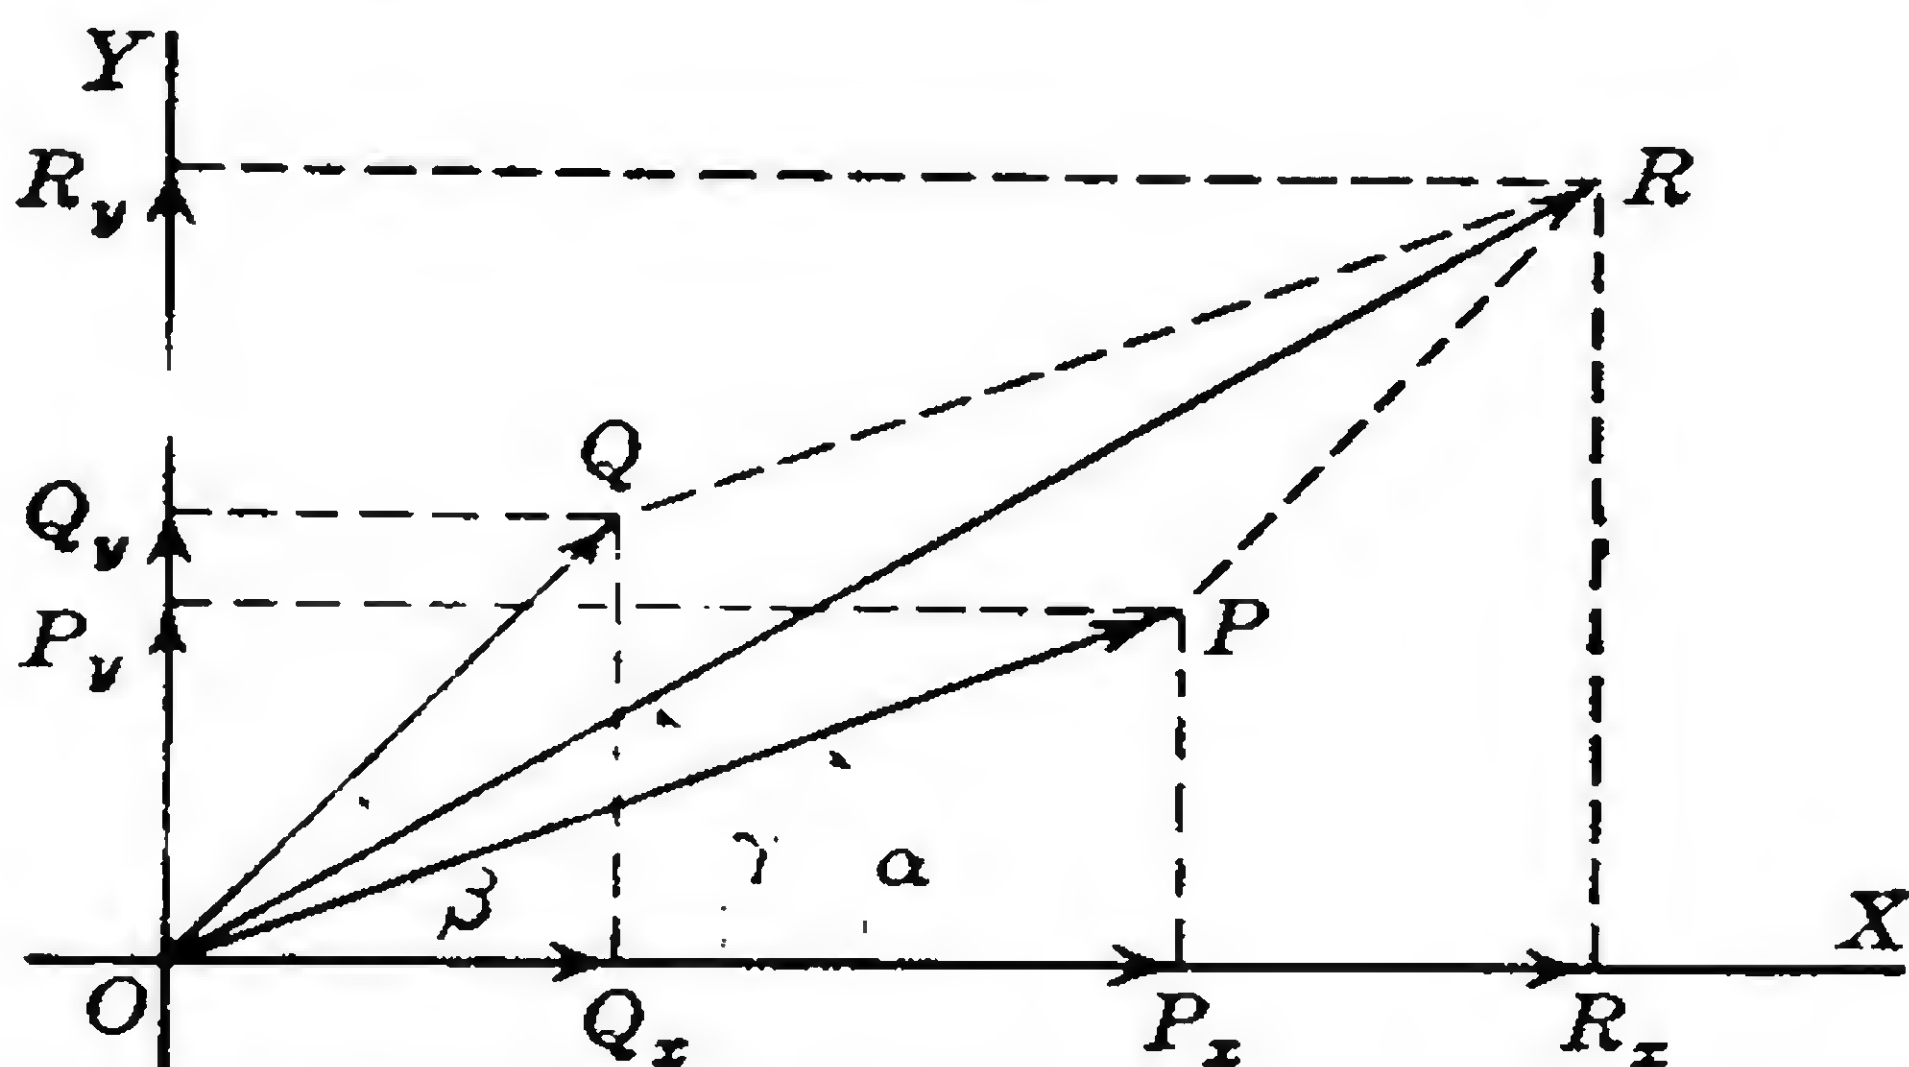

FIG. 28.—Complete graphical solution for the vector addition of two vectors.

$P$  to the  $x$ -axis it will cut the  $x$ -axis at  $P_x$ . This gives us a right triangle with vector  $P$  as the hypotenuse and having sides of length  $P_x$  and  $P_y$ . But this vector makes an angle  $\alpha$  with the  $x$ -axis, so by trigonometry we have

$$\cos \alpha = \frac{\text{adj}}{\text{hyp}} = \frac{P_x}{|P|}$$

or

$$P_x = |P| \cos \alpha \quad (5)$$

Similarly,

$$\sin \alpha = \frac{\text{opp}}{\text{hyp}} = \frac{P_y}{|P|}$$

or

$$P_y = |P| \sin \alpha \quad (6)$$

Similarly, in Fig. 27b we have a right triangle with hypotenuse =  $Q$ , opposite side =  $Q_y$ , and adjacent side =  $Q_x$ . This will give

$$\cos \beta = \frac{\text{adj}}{\text{hyp}} = \frac{Q_x}{|Q|}$$

or

$$Q_x = |Q| \cos \beta \quad (7)$$

and  $\sin \beta = \frac{\text{opp}}{\text{hyp}} = \frac{Q_y}{|Q|}$   
 or  $Q_y = |Q| \sin \beta$  (8)

Substituting Eqs. (5) and (7) in Eq. (1) gives

$$R_x = P_x + Q_x = |P| \cos \alpha + |Q| \cos \beta \quad (9)$$

Substituting Eqs. (6) and (8) in Eq. (2) gives

$$R_y = P_y + Q_y = |P| \sin \alpha + |Q| \sin \beta \quad (10)$$

Now, by substituting Eqs. (9) and (10) in (3), we get the resultant magnitude of the vector  $R$  in terms of the magnitude of vectors  $P$ ,  $Q$  and trigonometric functions of the angles  $\alpha$  and  $\beta$ , that is,

$$|R| = \sqrt{(|P| \cos \alpha + |Q| \cos \beta)^2 + (|P| \sin \alpha + |Q| \sin \beta)^2} \quad (11)$$

This equation is perfectly general for finding the magnitude of the vector  $R$ , which is the sum of any two vectors,  $P$  and  $Q$ , making angles  $\alpha$  and  $\beta$  respectively with the positive  $x$ -axis.

It is of interest to note that in Fig. 27 we have a right triangle with the magnitude of vector  $R$  the hypotenuse, the magnitude  $R_y$  the opposite side equal to  $|P| \sin \alpha + |Q| \sin \beta$ , and  $R_x$  the adjacent side equal to  $|P| \cos \alpha + |Q| \cos \beta$ . If we call the angle that vector  $R$  makes with the positive  $x$ -axis " $\gamma$ " (gamma), we have

$$\tan \gamma = \frac{\text{opp}}{\text{adj}} = \frac{R_y}{R_x} = \frac{|P| \sin \alpha + |Q| \sin \beta}{|P| \cos \alpha + |Q| \cos \beta} \quad (12)$$

Since we know the length of the opposite and adjacent side, the angle  $\gamma$  can be found by referring to any trigonometry table.

Equation (11) gives the *magnitude* of the resultant vector and Eq. (12) gives the *angle*; therefore, the resultant vector is completely determined.

**Example 1.** Referring to Fig. 26 we have given

$$\begin{array}{ll} |P| = 10 & \alpha = 30^\circ \\ |Q| = 5 & \beta = 60^\circ \end{array}$$

Determine the resultant vector  $R$ .

*Solution.* Since  $P$  and  $Q$  are not at right angles with each other, we must use the above method to determine the resultant, that is, find the  $x$ - and  $y$ -components, which will be at right angles and hence can be added by geometric addition to obtain the final resultant.

The  $x$ -component of  $P$  by Eq. (5) is

$$P_x = |P| \cos \alpha = 10 \cos 30^\circ = 10(0.866) = 8.66$$

The  $x$ -component of  $Q$  by Eq. (7) is

$$Q_x = |Q| \cos \beta = 5 \cos 60^\circ = 5(0.5) = 2.5$$

The resultant  $x$ -component by Eq. (1) is

$$R_x = P_x + Q_x = 8.66 + 2.5 = 11.16$$

Now, the  $y$ -component of  $P$  by Eq. (6) is

$$P_y = |P| \sin \alpha = 10 \sin 30^\circ = 10(0.5) = 5$$

and the  $y$ -component of  $Q$  by Eq. (8) is

$$Q_y = |Q| \sin \beta = 5 \sin 60^\circ = 5(0.866) = 4.33$$

The resultant  $y$ -component by Eq. (2) is then

$$R_y = P_y + Q_y = 5 + 4.33 = 9.33$$

Equation (3) will now give us the magnitude of the resultant, thus

$$\begin{aligned} |R| &= \sqrt{R_x^2 + R_y^2} = \sqrt{(11.16)^2 + (9.33)^2} \\ &= \sqrt{124.6 + 87.04} = \sqrt{211.6} \\ &= 14.54 \quad \text{Ans.} \end{aligned}$$

Now that we have the magnitude we will solve for  $\gamma$  (gamma), the angle the resultant vector  $R$  makes with the positive  $x$ -axis.

From Eq. (12) we have

$$\tan \gamma = \frac{R_y}{R_x} = \frac{9.33}{11.16} = 0.836$$

From trigonometric tables,  $\gamma = 39^\circ 54'$  Ans.

This gives the complete solution of the resultant vector  $R$  which is often written in engineering form as follows:<sup>1</sup>

$$\begin{aligned} R &= |R|/\gamma \\ &= 14.54/39^\circ 54' \quad \text{Ans.} \end{aligned}$$

This answer is read, "magnitude  $R$  at an angle of gamma," or "14.55 at an angle of 39 degrees 54 minutes."

<sup>1</sup> This form of notation is adopted here because of its common use in engineering. Furthermore, it lends itself readily to handwriting. Sometimes vectors are noted by boldface type or by a dot or bar placed above the

Since a vector has both *magnitude* and *direction*, the above way of writing vectors is very convenient; it gives the magnitude (14.55) and the direction with respect to the positive  $x$ -axis ( $39^\circ 54'$ ).

This problem was worked on the slide rule and hence the answer is not absolutely correct, but for ordinary engineering work it is entirely satisfactory.

It could have been solved by substituting directly in Eqs. (11) and (12) thus

$$|R| = \sqrt{(|P| \cos \alpha + |Q| \cos \beta)^2 + (|P| \sin \alpha + |Q| \sin \beta)^2}$$

Substituting the numerical values,

$$|R| = \sqrt{(10 \cos 30^\circ + 5 \cos 60^\circ)^2 + (10 \sin 30^\circ + 5 \sin 60^\circ)^2}$$

Looking up the trigonometric functions,

$$|R| = \sqrt{[10(0.866) + 5(0.5)]^2 + [10(0.5) + 5(0.866)]^2}$$

Performing the indicated multiplication,

$$|R| = \sqrt{(8.66 + 2.5)^2 + (5 + 4.33)^2}$$

Adding inside the parentheses and squaring,

$$|R| = \sqrt{(11.16)^2 + (9.33)^2} = \sqrt{124.6 + 87.04}$$

Adding under the radical and extracting the square root,

$$|R| = \sqrt{211.6} = 14.54 \text{ Ans.}$$

This answer is the same as was obtained above. Now, substituting in Eq. (12) we have

$$\tan \gamma = \frac{|P| \sin \alpha + |Q| \sin \beta}{|P| \cos \alpha + |Q| \cos \beta}$$

symbol. Then the equation can be written without vertical bars to denote magnitude, thus

$$\mathbf{R} = \dot{\mathbf{R}} = \bar{\mathbf{R}} = R/\gamma$$

Using this notation requires boldface type, a dot, or a bar to denote every vector quantity. With such a system, the boldface type could be used in print and the dot or bar placed above the vector symbol when written longhand. From the standpoint of making the system consistent in both print and script, and in order to save time and effort, it is more convenient to use the vertical bars the few times that they are needed to denote the absolute value or magnitude only.

Substituting numerical values,

$$\tan \gamma = \frac{10 \sin 30^\circ + 5 \sin 60^\circ}{10 \cos 30^\circ + 5 \cos 60^\circ}$$

Looking up angles in trigonometric tables,

$$\tan \gamma = \frac{10(0.5) + 5(0.866)}{10(0.866) + 5(0.5)}$$

Performing the indicated multiplication, addition, and division,

$$\tan \gamma = \frac{5 + 4.33}{8.66 + 2.5} = \frac{9.33}{11.16} = 0.836$$

From tables  $\gamma = 39^\circ 54'$ . *Ans.*

This answer also checks with the above results.

We will now work some examples to illustrate how vectors in quadrants other than the first are handled.

*Example 2.* Find the vector sum of  $A = 8/20^\circ$  and  $B = 20/120^\circ$ .

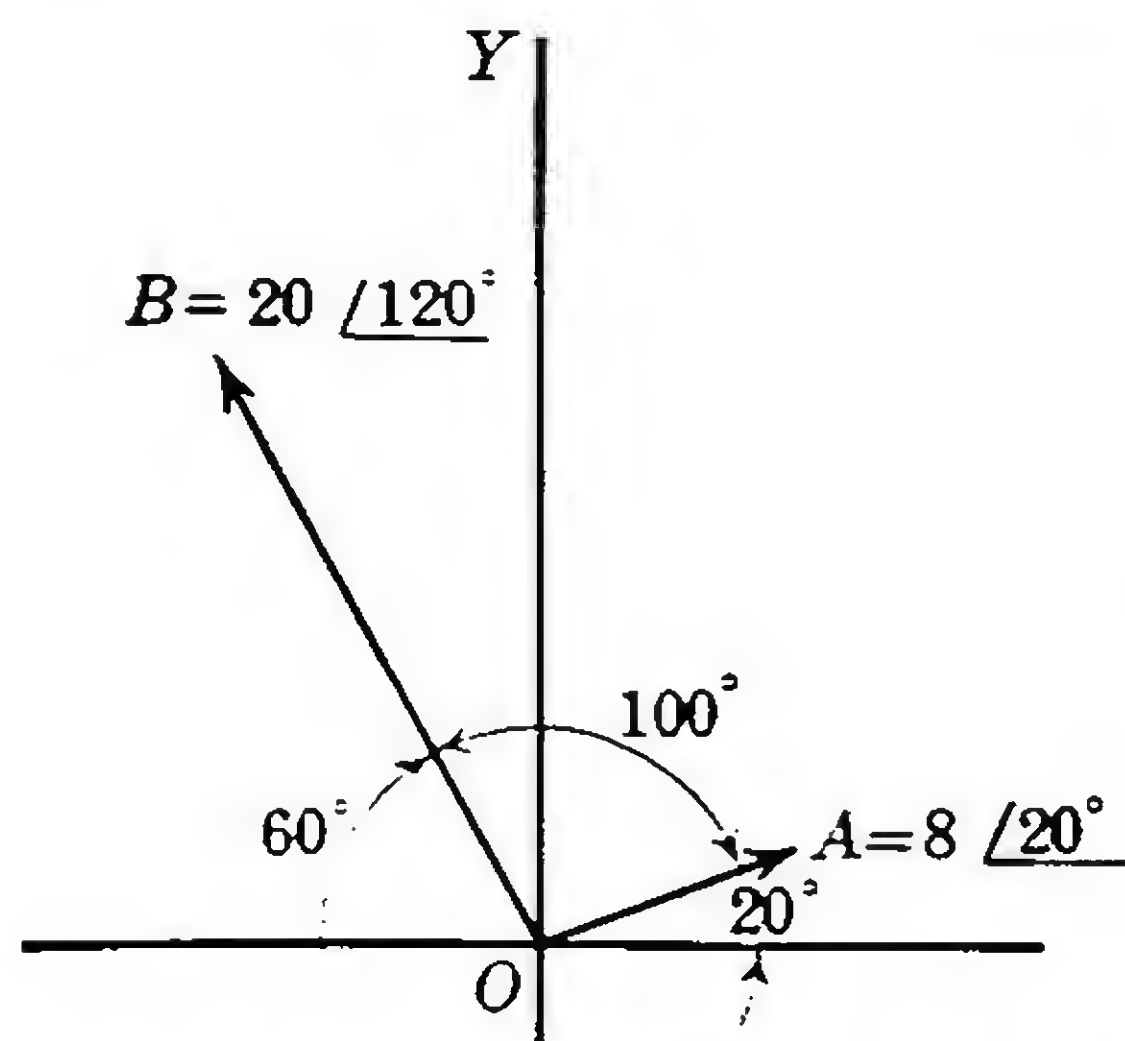

FIG. 29.—Vector diagram for Example 2.

*Solution.* As in the preceding problem we find the magnitude of the  $x$ - and  $y$ -components; thus, by Eq. (5),

$$\begin{aligned} A_x &= |A| \cos \alpha \\ &= 8 \cos 20^\circ \\ &= 8(0.9397) = 7.5175 \end{aligned}$$

By Eq. (6),

$$\begin{aligned} A_y &= |A| \sin \alpha \\ &= 8 \sin 20^\circ \\ &= 8(0.342) = 2.737 \end{aligned}$$

It will be noted that vector  $B$  is in the second quadrant, so the  $x$ -component will be along the negative  $x$ -axis. In this case we subtract the angle from  $180^\circ$  and get

$$180^\circ - 120^\circ = 60^\circ$$

This is the angle that vector  $B$  makes with the negative  $x$ -axis.

Proceeding as before, using Eq. (7), we get

$$\begin{aligned} B_x &= |B| \cos \beta \\ &= 20 \cos 120^\circ \\ &= 20(-\cos 60^\circ) \\ &= 20(-0.5) = -10 \end{aligned}$$

By inspection of the problem we can see that this must be negative. Now, by Eq. (8),

$$\begin{aligned} B_y &= |B| \sin \beta \\ &= 20 \sin 120^\circ \\ &= 20 \sin 60^\circ \\ &= 20(0.866) = 17.32 \end{aligned}$$

The sum of the  $x$ -components by Eq. (1) is

$$\begin{aligned} R_x &= A_x + B_x \\ &= 7.515 - 10 = -2.485 \end{aligned}$$

The sum of the  $y$ -components by Eq. (2) is

$$\begin{aligned} R_y &= A_y + B_y \\ &= 2.737 + 17.32 = 20.057 \end{aligned}$$

These components are shown in Fig. 30.

The magnitude of the resultant vector  $R$  by Eq. (3) is

$$\begin{aligned} |R| &= \sqrt{R_x^2 + R_y^2} \\ &= \sqrt{(-2.485)^2 + (20.057)^2} \end{aligned}$$

*Note:* The square of a negative number is a positive number. Squaring and adding under the radical sign,

$$\begin{aligned} |R| &= \sqrt{6.175 + 402.5} \\ &= \sqrt{408.675} \end{aligned}$$

Extracting the square root, the magnitude is

$$|R| = 20.22 \text{ Ans.}$$

The angle of the resultant vector  $R$  by Eq. (12) is

$$\begin{aligned} \tan \gamma &= \frac{R_y}{R_x} \\ &= \frac{20.057}{-2.485} = -8.062 \end{aligned}$$

*Note:* This is negative because it is in the second quadrant instead of the first. From trigonometric tables,

$$\gamma = 82^\circ 56'$$

This, however, is the angle vector  $R$  makes with the negative  $x$ -axis. If we subtract this from  $180^\circ$  we get the angle vector  $R$  makes with the positive

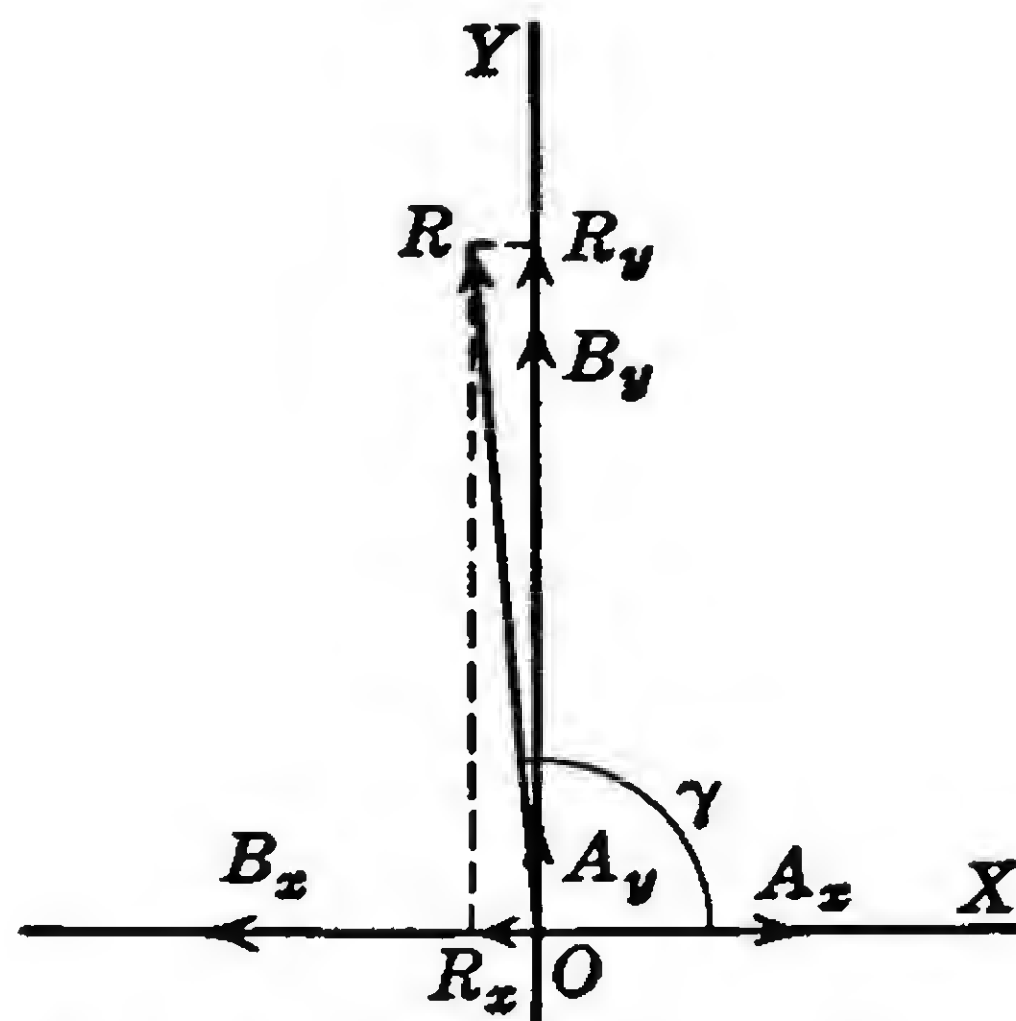

FIG. 30.—Vector diagram for Example 2.

$x$ -axis, thus

$$\gamma = 97^{\circ}04' \text{ Ans.}$$

The complete result (resultant vector) can be written

$$\begin{aligned} R &= |R|/\gamma \\ &= 20.22/97^{\circ}04' \text{ Ans.} \end{aligned}$$

The complete vector diagram of this problem is shown in Fig. 31.

It is of interest to note that graphically the resultant vector

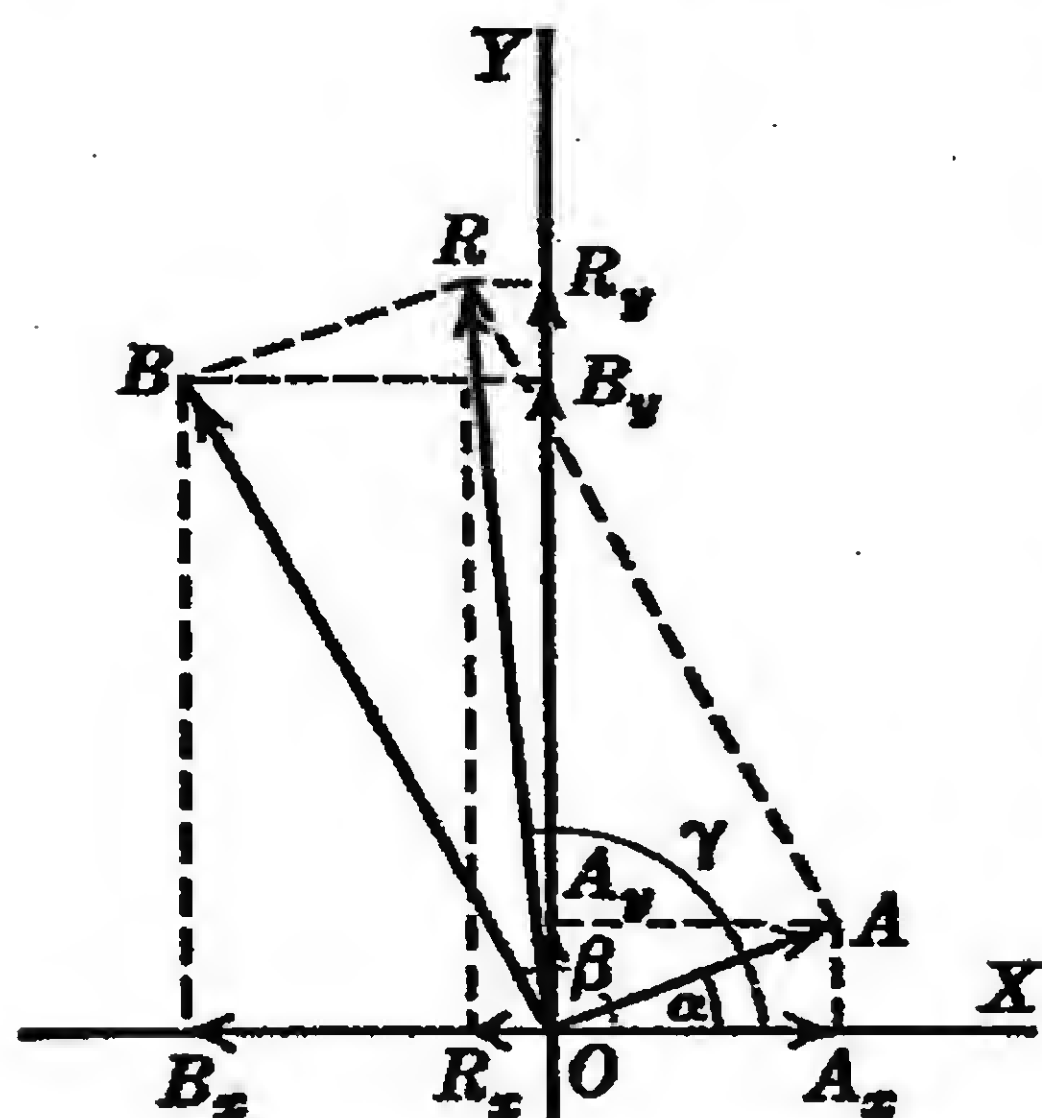

FIG. 31.—Complete vector diagram for Example 2.

$R$  can be found by completing the parallelogram having sides  $A$  and  $B$ , as shown in Fig. 31.

A thorough understanding of these two problems is sufficient to work most vector problems. One must be very careful to note the sense of the  $x$ - and  $y$ -components so that they can be added algebraically. Drawing a vector diagram will make this part of the problem clear.

We can generalize and handle any number of vectors by this process. Each vector must be reduced to its  $x$ - and  $y$ -components and the resultant vector will be the geometric sum of the resultant  $x$ - and  $y$ -components.

**Example 3.** We have given the following vectors:

$$A = |A|/\alpha = 10/45^{\circ}$$

$$B = |B|/\beta = 20/330^{\circ} \text{ or } 20/30^{\circ*}$$

$$C = |C|/\omega = 5/200^{\circ}$$

Find the resultant sum  $R = |R|/\gamma$ .

**Solution.** Draw the vector diagram as shown in Fig. 32. The magnitude of the resultant vector  $R$  for three vectors is given by

$$|R| = \sqrt{(|A| \cos \alpha + |B| \cos \beta + |C| \cos \omega)^2 + (|A| \sin \alpha + |B| \sin \beta + |C| \sin \omega)^2} \quad (13)$$

\* It is common practice to use the symbol  $/$  to denote that the angle is negative, while the symbol  $\angle$  is used to express positive angles.

It will be noted that this equation is like Eq. (11) with the exception that  $|C| \cos \omega$  and  $|C| \sin \omega$  are added. If more vectors were to be added they too would be included in each term under the radical, like  $C/\omega$ .

Substituting in the values of this example, we get

$$|R| = \sqrt{(10 \cos 45^\circ + 20 \cos 330^\circ + 5 \cos 200^\circ)^2 + (10 \sin 45^\circ + 20 \sin 330^\circ + 5 \sin 200^\circ)^2}$$

It will be recalled that if the vectors are not in the first quadrant we must find the angle they make with the  $x$ -axis and attach the correct sign. The

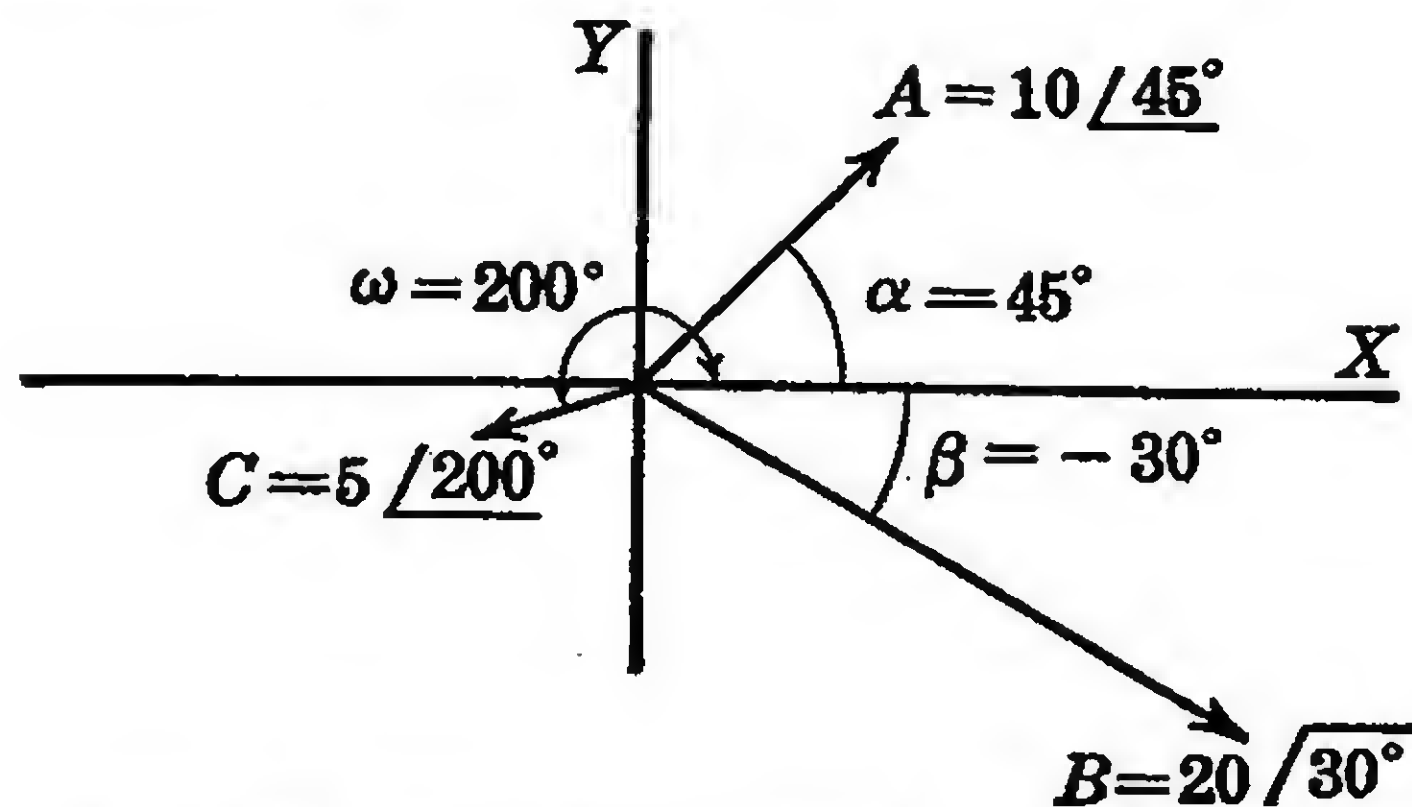

FIG. 32.—Vector diagram for Example 3.

sign to be attached depends on the sense, thus

$$\begin{aligned} \cos 330^\circ &= \cos (360^\circ - 330^\circ) = \cos 30^\circ \\ \cos 200^\circ &= -\cos (200^\circ - 180^\circ) = -\cos 20^\circ \end{aligned}$$

*Note:* This is along the negative  $x$ -axis.

$$\sin 330^\circ = -\sin (360^\circ - 330^\circ) = -\sin 30^\circ$$

*Note:* This is along the negative  $y$ -axis.

$$\sin 200^\circ = -\sin (200^\circ - 180^\circ) = -\sin 20^\circ$$

*Note:* This is also along the negative  $y$ -axis.

Looking up these angles in a trigonometric table gives

$$|R| = \sqrt{[10(0.707) + 20(0.866) - 5(0.9397)]^2 + [10(0.707) - 20(0.5) - 5(0.342)]^2}$$

Performing the indicated multiplication,

$$|R| = \sqrt{(7.07 + 17.32 - 4.698)^2 + (7.07 - 10 - 1.71)^2}$$

Adding terms within each parenthesis,

$$|R| = \sqrt{(19.692)^2 + (-4.64)^2}$$

Squaring the term in each parenthesis and adding,

$$\begin{aligned} |R| &= \sqrt{387.7 + 21.53} \\ &= \sqrt{409.23} \end{aligned}$$

Extracting the square root,

$$|R| = 20.23 \text{ Ans.}$$

Now the angle  $\gamma$  for three vectors is determined by

$$\tan \gamma = \frac{|A| \sin \alpha + |B| \sin \beta + |C| \sin \omega}{|A| \cos \alpha + |B| \cos \beta + |C| \cos \omega} \quad (14)$$

This equation is similar to Eq. (12) with the exception that another vector's components are added. If more than three vectors are to be added, their components are simply added to the numerator and denominator as shown in Eq. (14) for

$$C = |C|/\omega$$

It will be noted that the numerator is the opposite side and the denominator is the adjacent side. These terms were found when solving for the magnitude of  $R$  and hence we can take from that work

$$\tan \gamma = \frac{R_y}{R_x} = \frac{-4.64}{19.692} = -0.2358$$

From trigonometric tables we find  $\tan^{-1}(0.2358)$  is  $13^\circ 16'$ . Since the quantity is negative, the resultant is located  $-13^\circ 16'$  from the positive

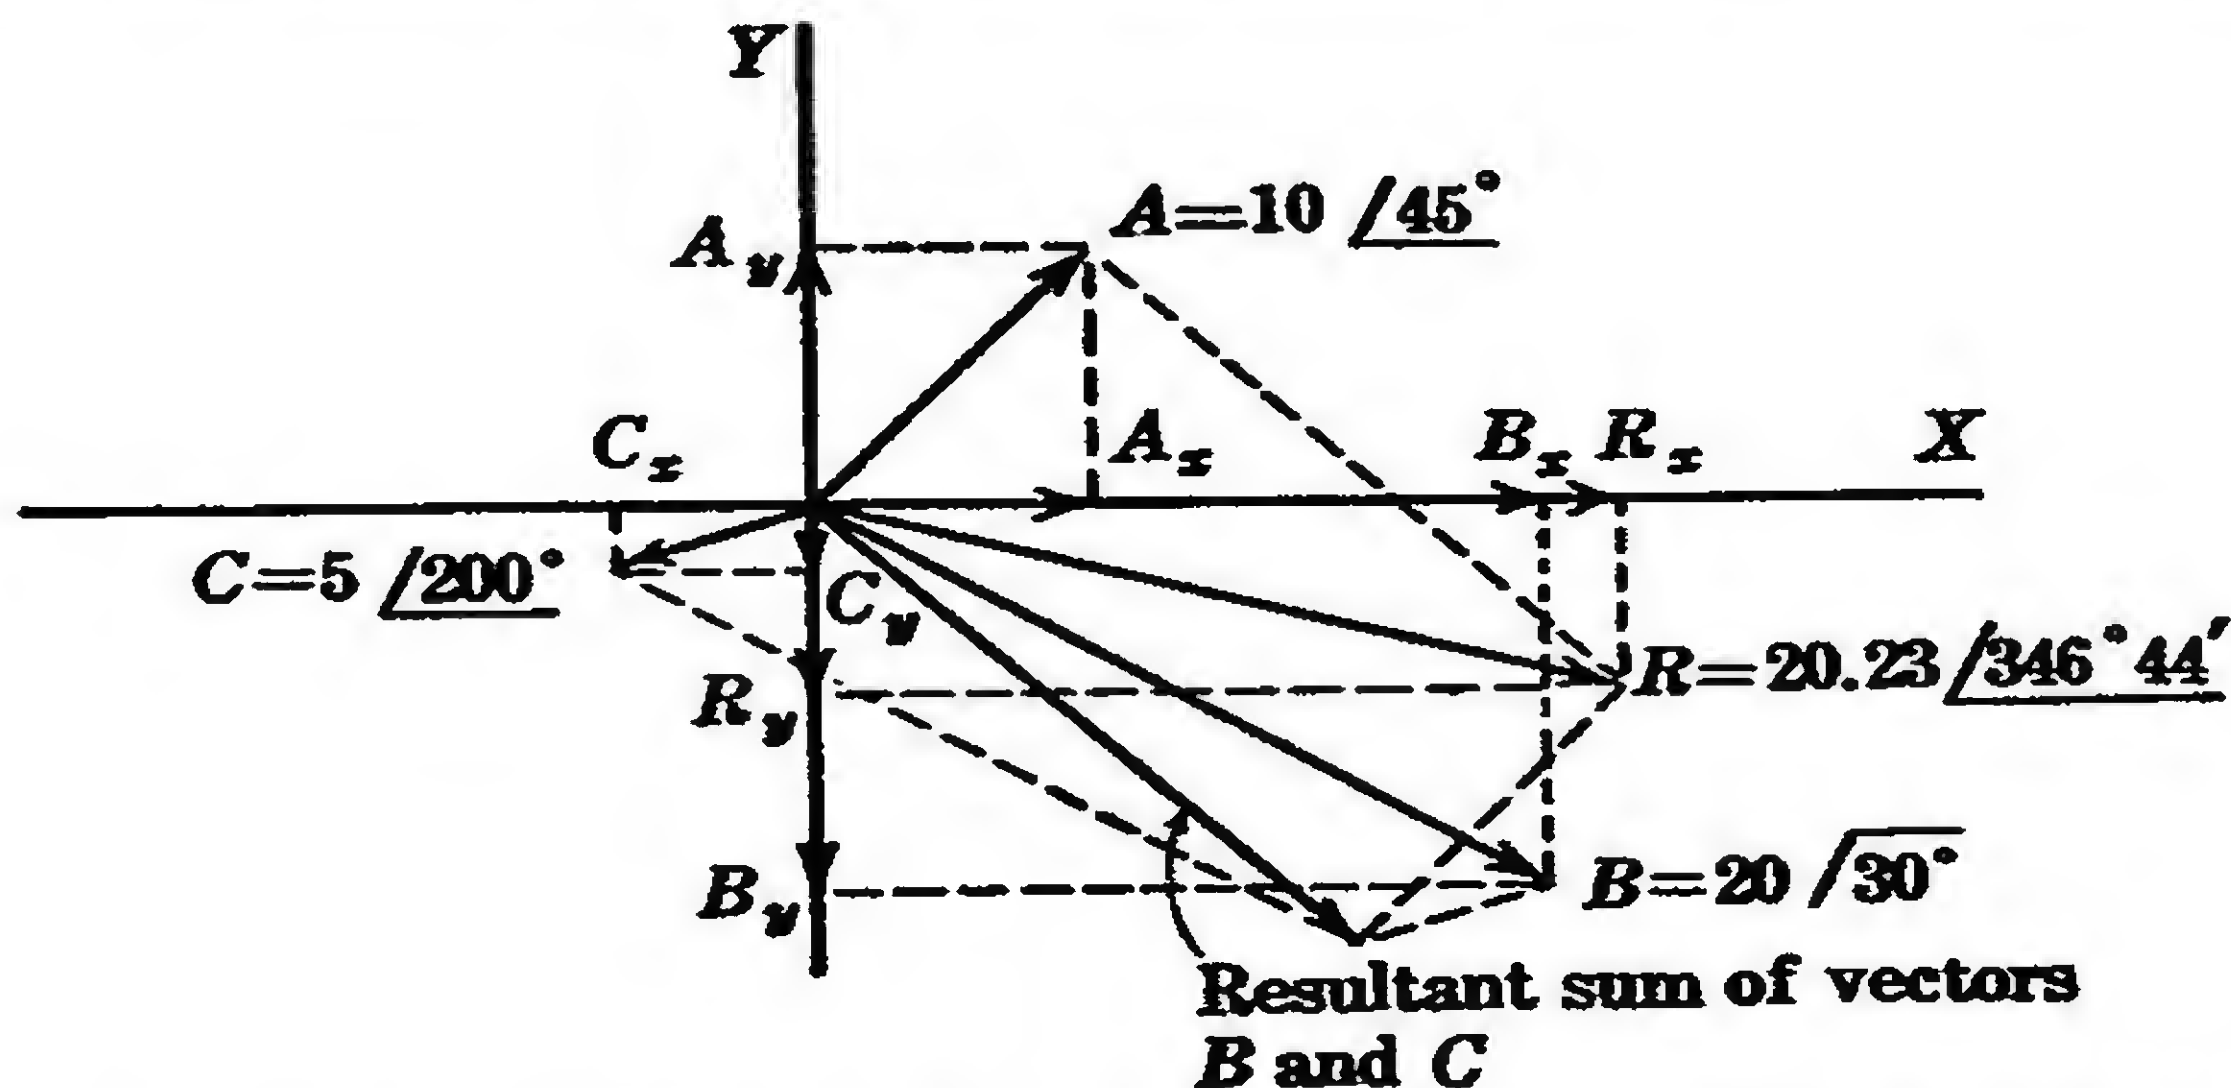

FIG. 33.—Vector diagram showing vectors  $A$ ,  $B$  and  $C$ , their  $x$ - and  $y$ -components, the resultant vector sum of vectors  $B$  and  $C$ , and the resultant sum  $R$  for all three vectors in Example 3.

$x$ -axis. Drawing the vector diagram is the best way to make this clear (See Fig. 33). Then,

$$\gamma = -13^\circ 16' \text{ or } 346^\circ 44' \text{ Ans.}$$

The vector sum can now be expressed

$$\begin{aligned} R &= |R|/\gamma = 20.23/346^\circ 44' \\ &= 20.23/13^\circ 16' \text{ Ans.} \end{aligned}$$

Graphically, if there are three vectors, two (such as  $|B|$  and  $|C|$  in Fig. 33) can be added by the parallelogram law to get their resultant. Then this resultant can be added to the remain-

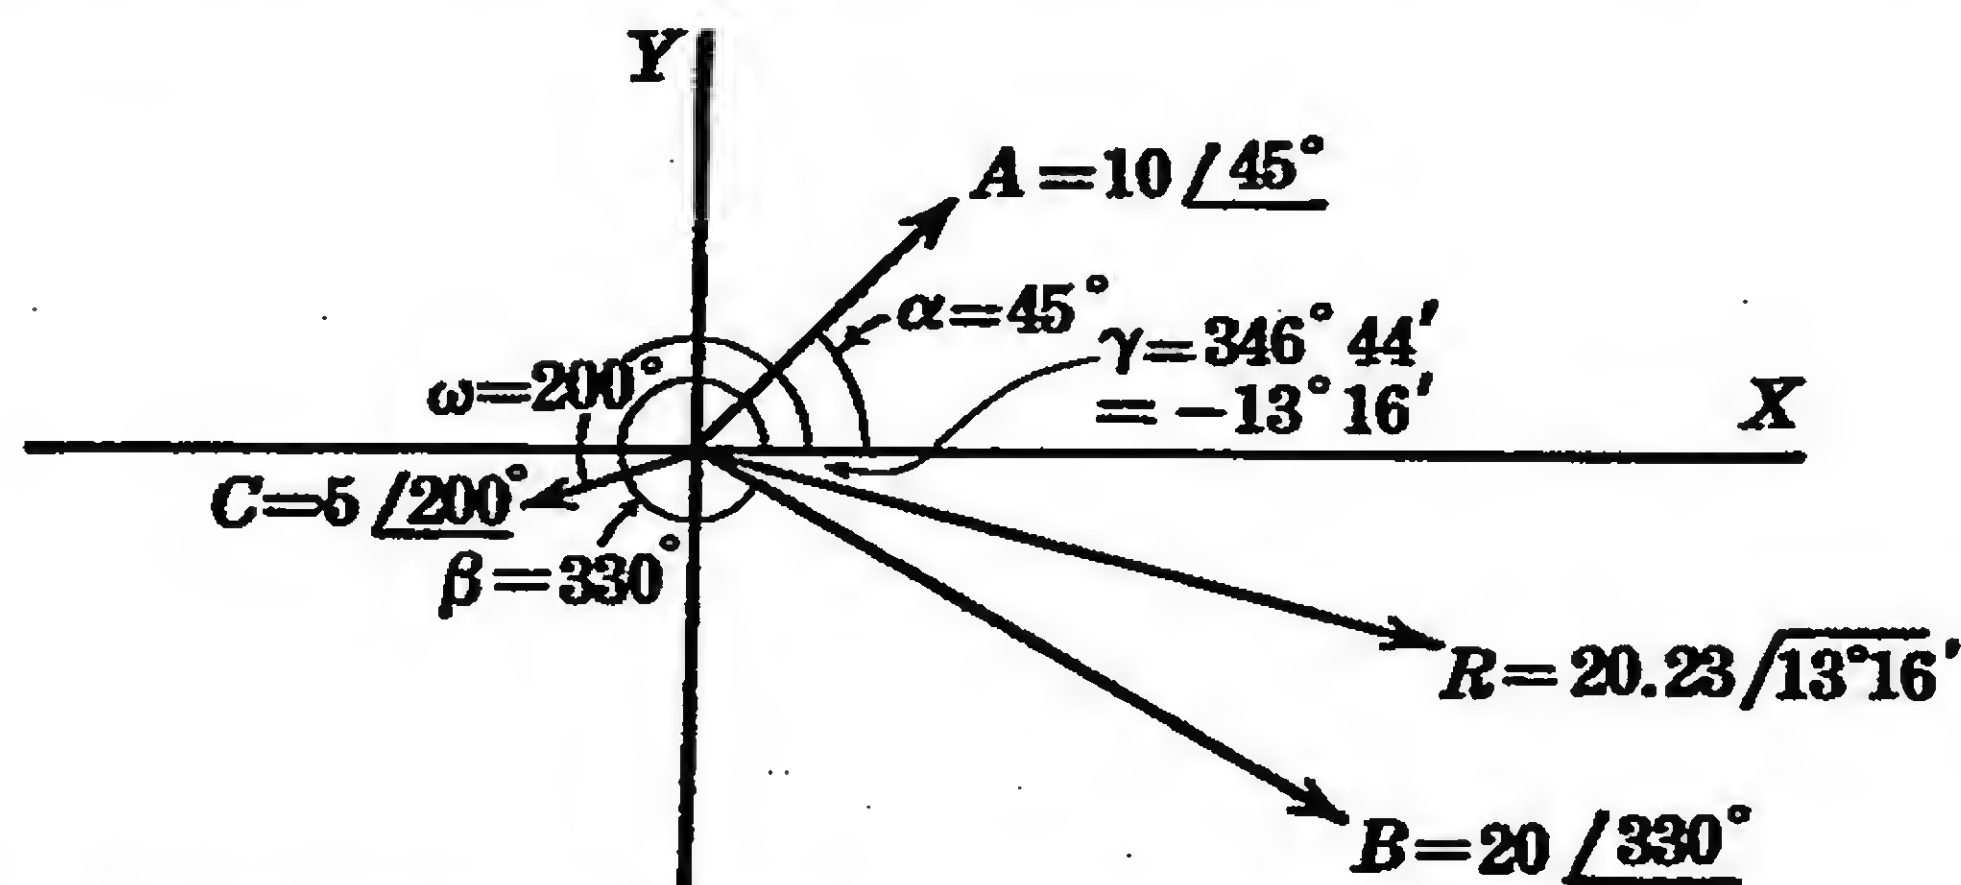

FIG. 34.—Vector diagram showing the magnitudes and angles of vectors  $A$ ,  $B$ ,  $C$ , and  $R$  for Example 3.

ing vector to get the total vector sum. The three vectors  $A$ ,  $B$ ,  $C$  and their sum  $R$  are shown in Fig. 34.

**Solution of Right Triangles with the Slide Rule.**—There is a short-cut method of obtaining the hypotenuse of a right triangle when the two sides are given. Since we shall be solving many right triangles, the development will be given here.

Referring to the right triangle in Fig. 35, we have

$$a^2 + b^2 = c^2$$

or 
$$c = \sqrt{a^2 + b^2}$$

Always select  $a$  as the shortest side. Then since multiplying both numerator and denominator of a fraction by the same thing ( $a^2$  in this case) does not change the value of a fraction, the above equation can be written

$$c = \sqrt{\frac{a^2(a^2 + b^2)}{a^2}}$$

This may then be written

$$c = a \sqrt{\frac{a^2 + b^2}{a^2}}$$

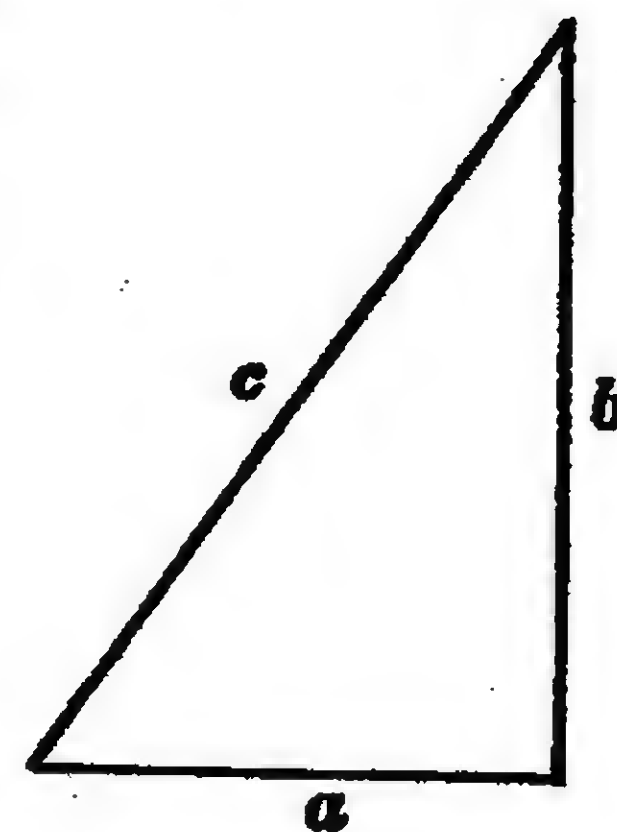

FIG. 35.—Right triangle for slide-rule solution by Eq. (15) when  $b > a$ .

taking two separate fractions under the radical gives

$$\begin{aligned} c &= a \sqrt{\frac{a^2}{a^2} + \frac{b^2}{a^2}} \\ &= a \sqrt{\frac{b^2}{a^2} + 1} \end{aligned}$$

Since both numerator and denominator are squared under the radical, we can write

$$c = a \sqrt{\left(\frac{b}{a}\right)^2 + 1} \quad (15)$$

This is the desired equation. Let us take an illustration to show how it is used.

*Illustration.*—Let  $a = 6$ ,  $b = 8$ ; to find  $c$  the hypotenuse.

*Solution.* First, set the hairline over  $b$ , (8), on scale  $D$  and move the slider so that  $a$ , (6), is also under the hairline. (Scale  $C$  on the slider.)

The quotient of  $b$  divided by  $a$  will be found opposite the initial index of Scale  $C$  on Scale  $D$ . In this case it will be 1.333. (The student should follow this on the slide rule.)

Second, move the hairline over the initial index and read the square of the quotient 1.333 on scale  $A$  under the hairline. In this case it will be 1.777 and is

$$\left(\frac{b}{a}\right)^2$$

Third, add 1 to this number and slide the hairline to that value on scale  $A$ , which in this case will be 2.777. We now have, on scale  $A$ , the quantity

$$\left(\frac{b}{a}\right)^2 + 1$$

Fourth, take the square root by looking under the hairline on scale  $D$ . In this case you will find 1.666, which is

$$\sqrt{\left(\frac{b}{a}\right)^2 + 1}$$

Fifth, move the initial index of scale  $C$  under the hairline and then move the hairline to  $a$  on scale  $C$ , which in this case will be

6. The answer will be found on scale  $D$  under the hairline and in this case will be 10. We then have the complete expression solved for  $c$ , that is,

$$c = a \sqrt{\left(\frac{b}{a}\right)^2 + 1} = 6 \sqrt{\left(\frac{8}{6}\right)^2 + 1} = 10 \quad \text{Ans.}$$

*Note:* In the development  $a$  was the shortest side, while in some of the above examples this is not true. Therefore, the  $a$  and  $b$  will have to be interchanged in these cases.

### Exercises

In each of the following problems, draw a vector diagram approximately to scale and solve for the resultant vector sum (magnitude and angle):

1. Voltage vector  $V_1 = 110/\underline{0^\circ}$  (110 volts at an angle of  $0^\circ$  with positive  $x$ -axis).

Voltage vector  $V_2 = 115/\underline{75^\circ}$  (115 volts at an angle of  $75^\circ$  with positive  $x$ -axis).

2. Impedance vector  $Z_1 = 100/\underline{40^\circ}$ .

Impedance vector  $Z_2 = 50/\underline{15^\circ}$  or  $50/\underline{345^\circ}$ .

3. Current vector  $I_1 = 3/\underline{215^\circ}$ .

Current vector  $I_2 = 4/\underline{300^\circ}$ .

4. Voltage vector  $V_1 = 150/\underline{60^\circ}$ .

Voltage vector  $V_2 = 100/\underline{180^\circ}$ .

Voltage vector  $V_3 = 50/\underline{300^\circ}$ .

5. Force vector  $F_1 = 17/\underline{110^\circ}$ .

Force vector  $F_2 = 15/\underline{320^\circ}$ .

Force vector  $F_3 = 10/\underline{190^\circ}$ .

Work each of the following exercises by the slide-rule method and check for the resultant hypotenuse by the longer method:

6.  $a = 3$ ,  $b = 4$ . Find  $c$ .

7.  $a = 5$ ,  $b = 5$ . Find  $c$ .

8.  $a = 14$ ,  $b = 11$ . Find  $c$ .

9.  $a = 76$ ,  $b = 21$ . Find  $c$ .

10.  $a = 1.28$ ,  $b = 0.91$ . Find  $c$ .

## CHAPTER 7

### COMPLEX QUANTITIES

The title of this chapter should not frighten the student, because we have been studying complex quantities in the last chapter. The vectors of the last lesson were complex quantities, because they had two components at right angles. In other words, *a complex quantity may be represented as a vector resolved into two components 90 degrees apart, the  $x$ -component and the  $y$ -component.*

In the last chapter the  $x$ -components were designated by using  $x$  as a subscript to the vector and the  $y$ -components were designated by using  $y$  as a subscript to the vector. The only way we could represent the complete vector was in engineering form as

$$c = |c|/\alpha \quad (1)$$

It would often be an advantage to represent the vector in terms of the  $x$  and  $y$ -components. To do this with a minimum of labor the  $x$ -components are written without subscripts and the  $y$ -components are prefixed with the letter  $j$ . The above vector  $c$  can then be written

$$c = a + jb \quad (2)$$

Where  $a$  is the adjacent side and  $b$  is the opposite side of a right triangle, as shown in Fig. 36.

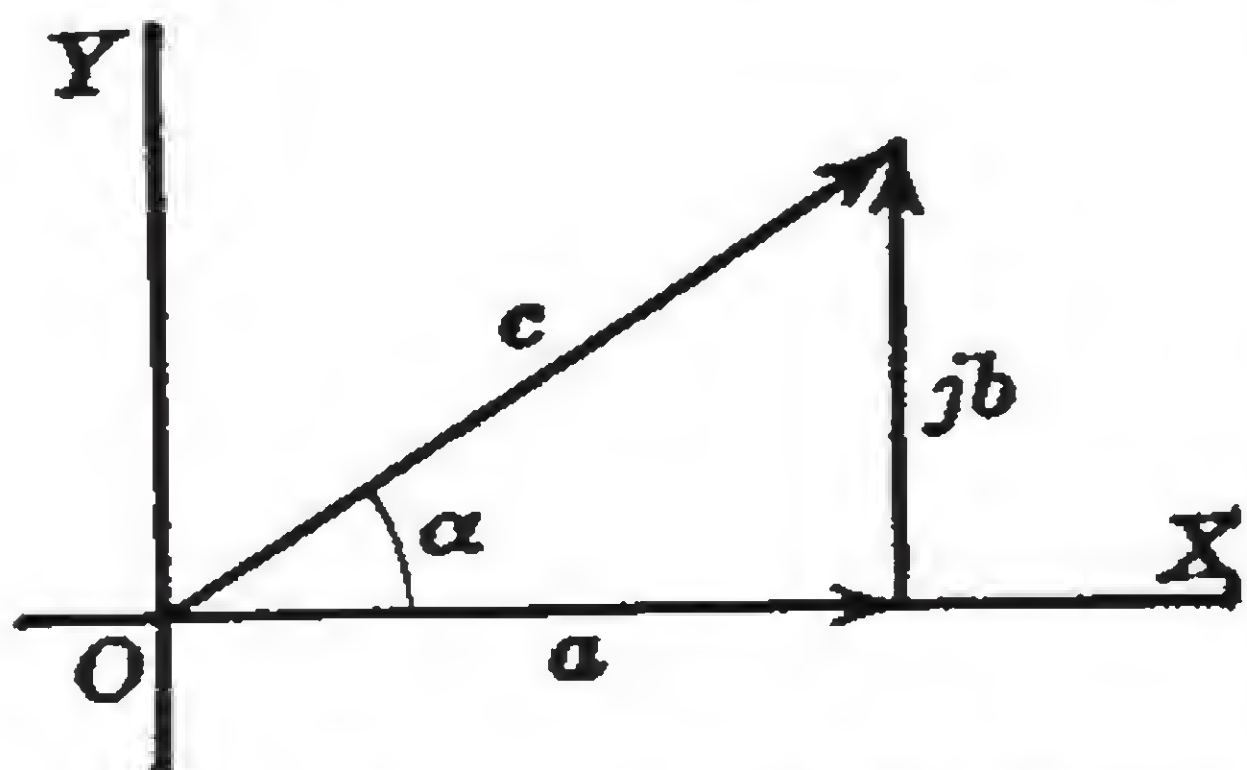

FIG. 36.—Graphical representation of a complex quantity.

In Eq. (2), the vector  $a$  always lies along the  $x$ -axis. When numerical values are substituted they are either positive or negative numbers which measure a magnitude along the  $x$ -axis. Since the magnitude and direction are specified by the numerical number, it in effect is a vector; however, it is not ordinarily written as a vector in bold

face type or with a dot or dash over it. When using complex numbers it is understood to be a real number along the  $x$ -axis.

The letter  $j$  is known as an “operator” much like the operators of algebra already familiar to the student, for example, the plus (+) sign, minus (−) sign, division ( $\div$ ) sign, multiplication ( $\times$ ) sign, and radical ( $\sqrt{\phantom{x}}$ ) sign.

As the above signs tell us the operation to perform, so does the  $j$  operator tell us what to do. Thus the  $j$  operator, when multiplied by a number, has the effect of *turning the vector 90 degrees counterclockwise from its original position*.

In Eq. (2) and Fig. 36 the vector  $b$  is a real number which always lies along the  $x$ -axis. Multiplying this real number by the operator  $j$  makes it lie along the  $y$ -axis. When a numerical value is substituted for  $b$  it is not ordinarily written as a

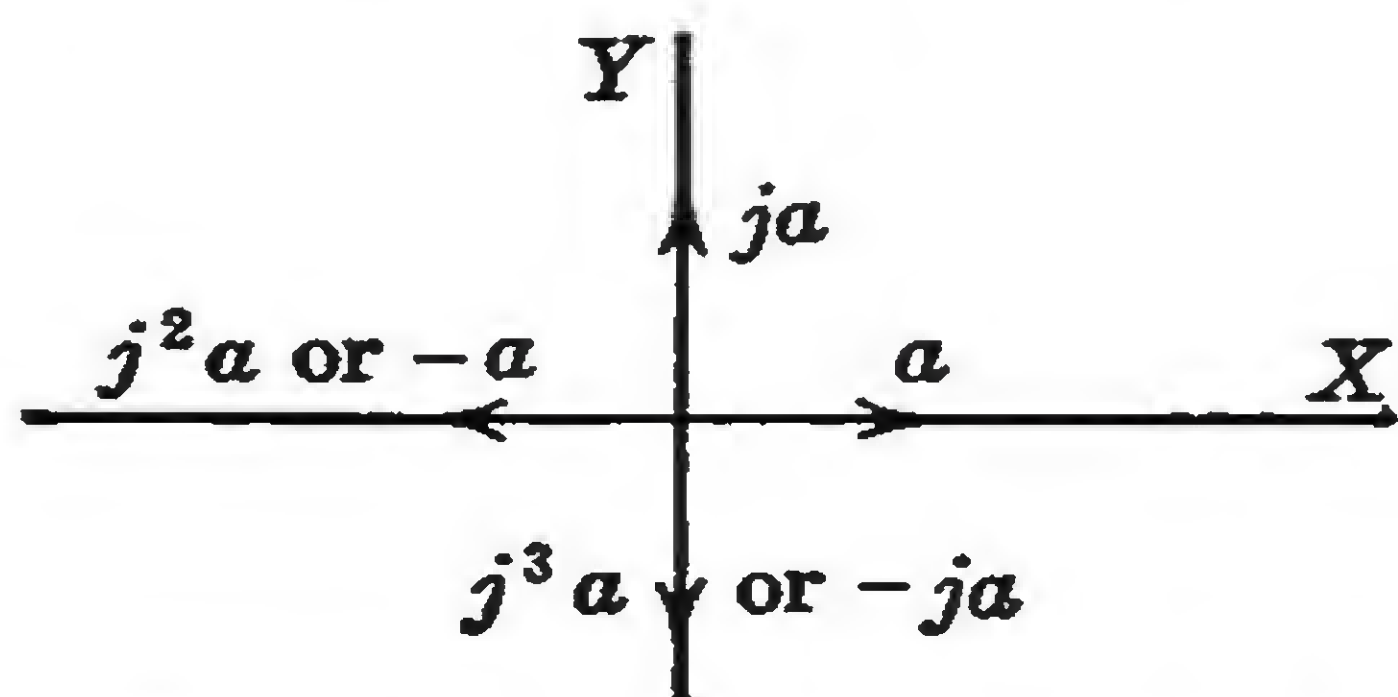

FIG. 37.—Graph showing effect of  $j$  operator when successively applied to the vector  $a$ .

vector, but understood to lie along the  $y$ -axis when multiplied by  $j$ .

Let us apply the operator  $j$  to the vector  $a$  along the positive  $x$ -axis as shown in Fig. 37. The vector  $ja$  must lie along the positive  $y$ -axis. Now if we apply another  $j$  we get  $j^2a$  which rotates vector  $ja$  90 degrees and hence it will lie along the negative  $x$ -axis, but according to ordinary algebra this vector is negative and must be  $-a$ ; therefore

$$j^2a = -a$$

Dividing by  $a$ , we get

$$j^2 = -1$$

or, taking the square root,

$$j = \sqrt{-1} \quad (\text{a definition of } j) \quad (3)$$

If we multiply  $j^2a$  by  $j$  the line is turned through another 90 degrees and will lie along the negative  $y$ -axis as shown in Fig. 36. If the  $j^2$  is replaced by  $-1$ , we have

$$j^3a = j^2ja = -ja$$

Again, if  $-ja$  is multiplied by  $j$  the vector along the negative  $y$ -axis will be rotated 90 degrees and will lie along the positive  $x$ -axis. That is

$$j^4a = (-ja)j = -j^2a = -(-1)a = a$$

and we have returned to the starting point again to get the same vector  $a$ . This shows that the system is consistent.

**Expressing Vectors in Complex Notation.**—We can now represent vectors not only in the first quadrant, as shown in Fig. 36, but in all four quadrants. Figure 38 shows impedance vectors in each quadrant.  $Z$  is the hypotenuse of a right triangle having sides  $R$  and  $jX$ , where  $R$  = the resistance component and  $X$  = the reactance component. (Large  $X$ , which is the react-

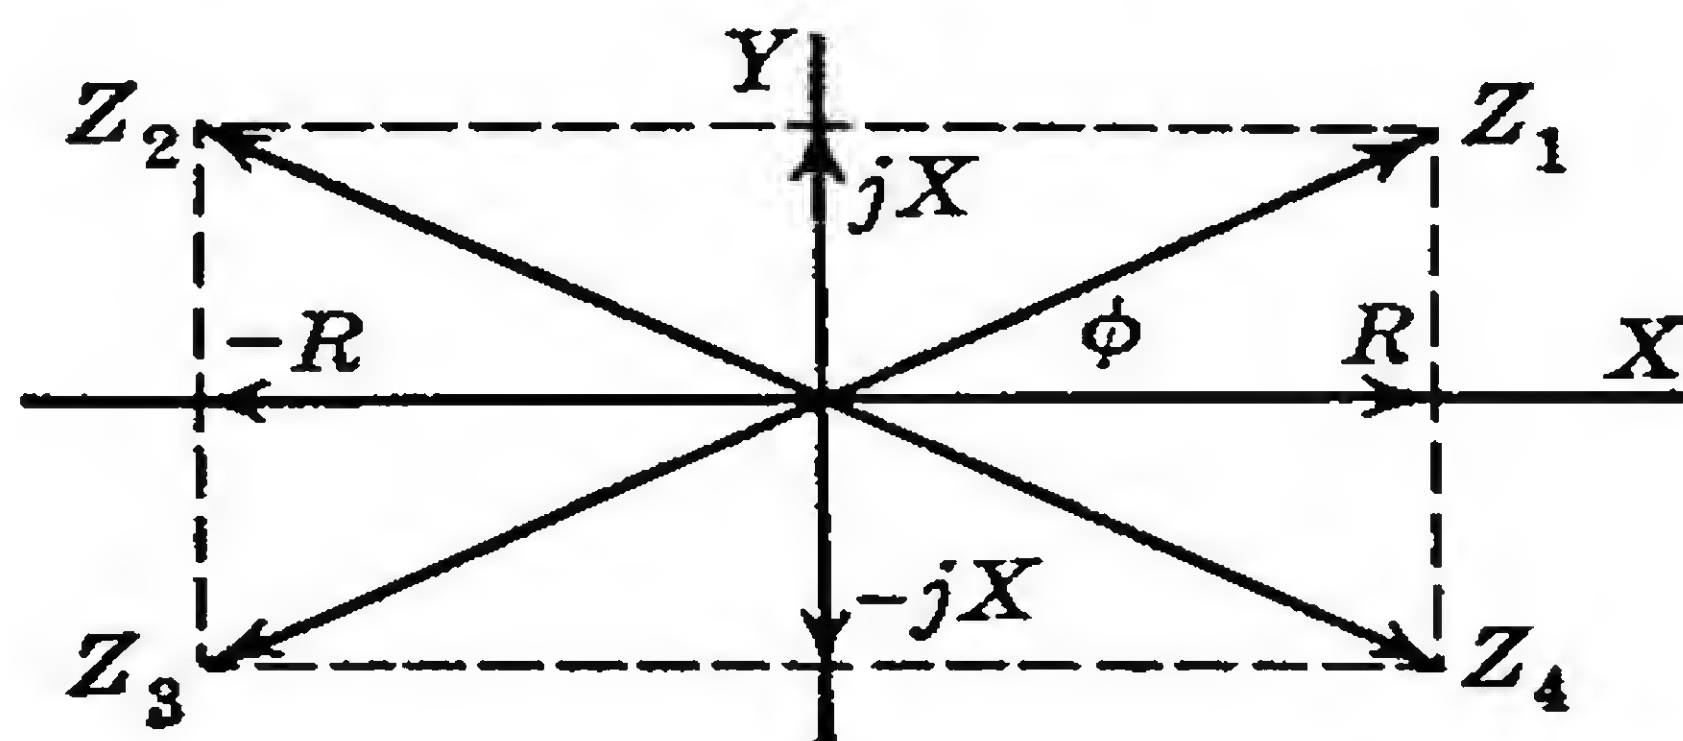

FIG. 38.—Impedance vector  $Z$  represented in all four quadrants.

ance, is not the same as small  $x$ , which is the  $x$ -axis.) The impedance vector  $Z_1$  can be written

$$Z_1 = R + jX \quad (\text{first quadrant}) \quad (4)$$

the impedance vector  $Z_2$  can be written

$$Z_2 = -R + jX \quad (\text{second quadrant}) \quad (5)$$

the impedance vector  $Z_3$  can be written

$$Z_3 = -R - jX \quad (\text{third quadrant}) \quad (6)$$

and the impedance vector  $Z_4$  can be written

$$Z_4 = R - jX \quad (\text{fourth quadrant}) \quad (7)$$

Just as in the last chapter the *magnitude* of the  $Z$  vector is the square root of the sum of the squares of the two sides of the right triangle, that is

$$|Z| = \sqrt{R^2 + X^2} \quad (8)$$

Also the angle  $\phi$  (phi) is determined, as it was in the last chapter, by the equation

$$\tan \phi = \frac{\text{opp}}{\text{adj}} = \frac{X}{R} \quad (9)$$

The above equations for  $Z_1$ ,  $Z_2$ ,  $Z_3$  and  $Z_4$  are valuable for *adding vectors* because the  $x$ - and  $y$ -components are at right

angles. The resultant  $x$ - and  $y$ -components can then be added geometrically to obtain the resultant.

*Example 1.* Add vector  $Z_1$  to vector  $Z_2$ .

$$\begin{array}{rcl} \text{Solution.} & Z_1 = & R + jX \\ & Z_2 = & -R + jX \\ \hline & Z_1 + Z_2 = & +2jX. \quad \text{Ans.} \end{array}$$

*Example 2.* Subtract vector  $Z_3$  from vector  $Z_4$ .

$$\begin{array}{rcl} \text{Solution.} & Z_4 = & R - jX \\ & Z_3 = & -R - jX \\ \hline & Z_4 - Z_3 = & 2R. \quad \text{Ans.} \end{array}$$

**Multiplication of Vectors in Polar Form.**—However, for multiplication the other form  $A = |A|/\underline{\alpha}$  is advantageous. For illustration, multiply vector  $A$  by vector  $B$  where,  $A = |A|/\underline{\alpha}$

$$B = |B|/\underline{\beta}$$

These vectors are expressed in polar coordinates; that is, they are expressed as a magnitude rotated through an angle from the base line.

To multiply two vectors expressed in polar coordinates, obtain the product of their magnitude and add the angles.

Thus

$$C = AB = (|A|/\underline{\alpha})(|B|/\underline{\beta}) = |A||B|/\underline{\alpha + \beta} \quad (10)$$

*Example 3.* Multiply vector  $A$  by vector  $B$  where  $A = 10/\underline{30^\circ}$  and  $B = 5/\underline{50^\circ}$

*Solution.* Substituting these values in Eq. (10),

$$\begin{aligned} C &= (10)(5)/\underline{30^\circ + 50^\circ} \\ &= 50/\underline{80^\circ} \quad \text{the product} \quad \text{Ans.} \end{aligned}$$

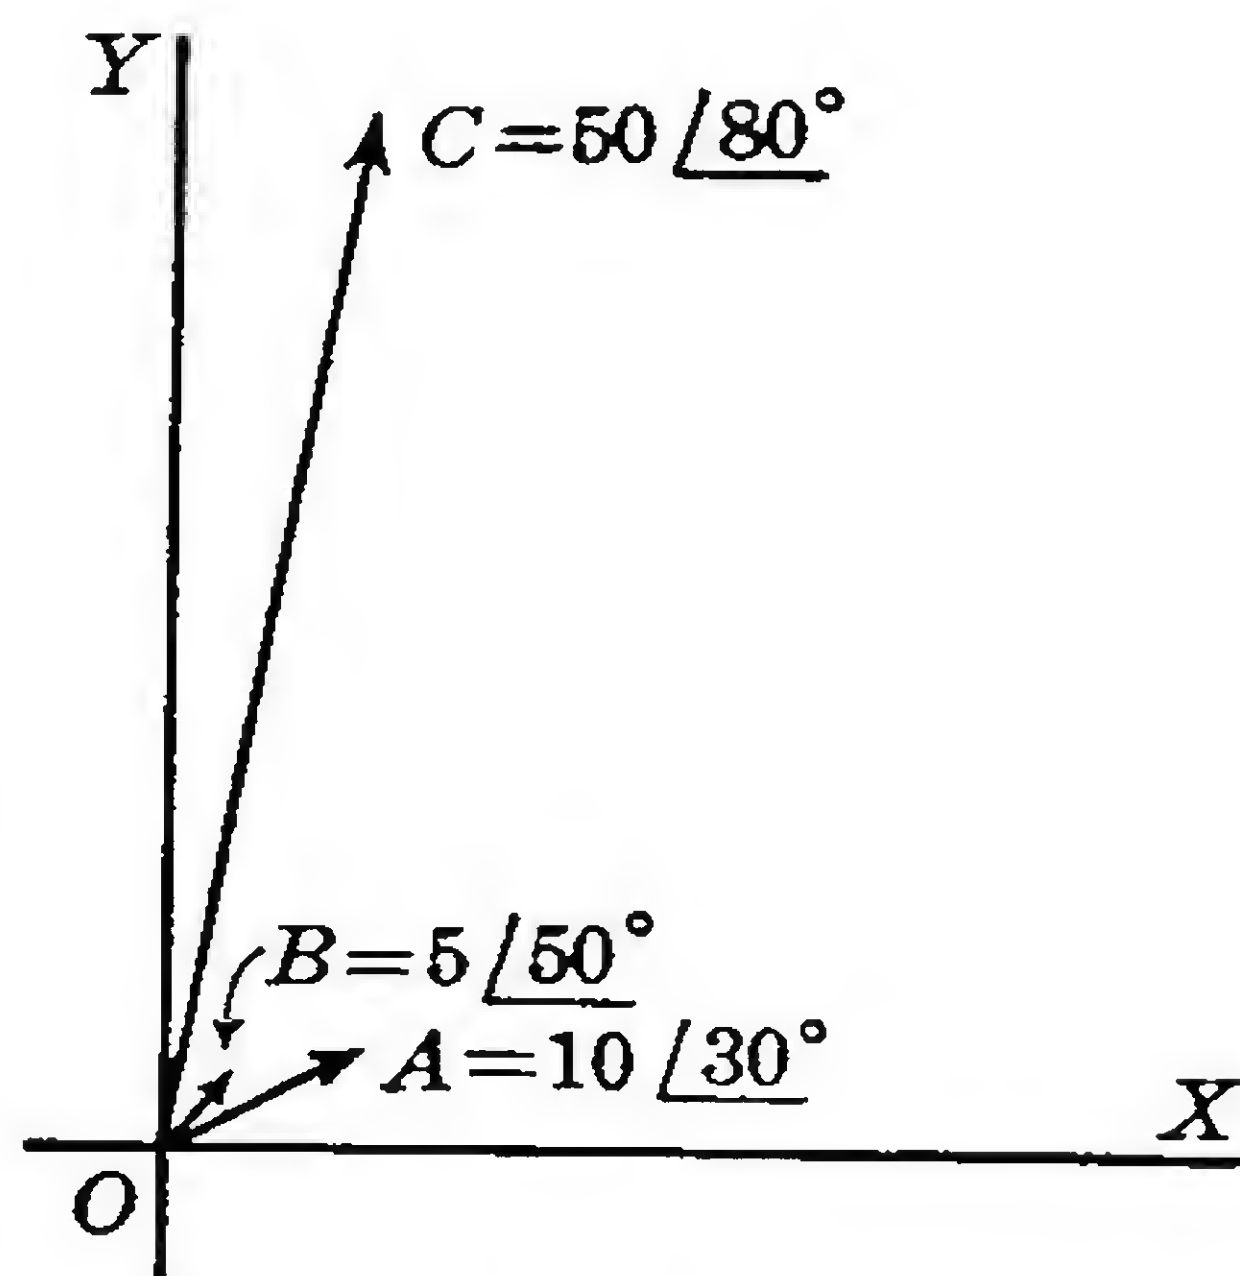

FIG. 39.—Multiplication of vectors  $A$  and  $B$ , which results in vector  $C$ .

**Division of Vectors in Polar Form.**—The division of vectors is just as easy as their multiplication. The rule is to divide one vector by another in polar coordinates, obtain the quotient of the magnitudes and subtract the angle in the denominator from the angle in the numerator. Applying this rule, let vector  $C$  be the quotient of vector  $A$  divided by vector  $B$ , thus

$$C = \frac{A}{B} = \frac{|A|/\alpha}{|B|/\beta} = \frac{|A|}{|B|} \underline{\alpha - \beta} \quad (11)$$

*Example 4.* Divide vector  $E$  by vector  $Z$  where  $E = 100/60^\circ$  and  $Z = 5/5^\circ$

*Solution.* Substituting these values in Eq. (11),

$$I = \frac{E}{Z} = \frac{100/60^\circ}{5/5^\circ}$$

Dividing the magnitudes  $100/5 = 20$  and subtracting the denominator angle from the numerator angle gives

$$60^\circ - 5^\circ = 55^\circ$$

$$\begin{aligned} \text{Hence } I &= \frac{E}{Z} = \frac{100/60^\circ}{5/5^\circ} = \frac{100}{5} \underline{60^\circ - 5^\circ} \\ &= 20/55^\circ \text{ the quotient. } \textit{Ans.} \end{aligned}$$

*Example 5.* Divide vector  $E$  by vector  $I$  when  $E = 8/10^\circ$  and  $I = 16/40^\circ$

*Solution.* Substituting these values in Eq. (11),

$$\begin{aligned} Z &= \frac{E}{I} = \frac{8/10^\circ}{16/40^\circ} = \frac{8}{16} \underline{10^\circ - 40^\circ} \\ &= 0.5/30^\circ \text{ or } 0.5/330^\circ \text{ the quotient } \textit{Ans.} \end{aligned}$$

**Trigonometry Applied to Complex Numbers.**—According to what we learned in the last chapter, the magnitude of the  $x$ -component of  $c$  is  $|c| \cos \alpha$  and the magnitude of the  $y$ -component of  $c$  is  $|c| \sin \alpha$ . In complex numbers we write

$$c = a + jb$$

but  $a$  is the  $x$ -component  $|c| \cos \alpha$  and  $b$  is the  $y$ -component  $|c| \sin \alpha$ ; therefore, we can write

$$c = |c| \cos \alpha + j|c| \sin \alpha$$

Factoring out the  $|c|$  on the right-hand side gives

$$c = |c| (\cos \alpha + j \sin \alpha) \quad (12)$$

In this equation  $|c|$  is the magnitude of the vector and

$$(\cos \alpha + j \sin \alpha)$$

is the *trigonometric operator* which rotates the vector through the angle  $\alpha$  in a counterclockwise direction from the positive  $x$ -axis.

The quantity  $(\cos \alpha + j \sin \alpha)$  always has a magnitude of unity. It is a unit vector specifying the direction the magnitude must take. It can be thought of as the radius of a unit circle, as illustrated in Fig. 40.

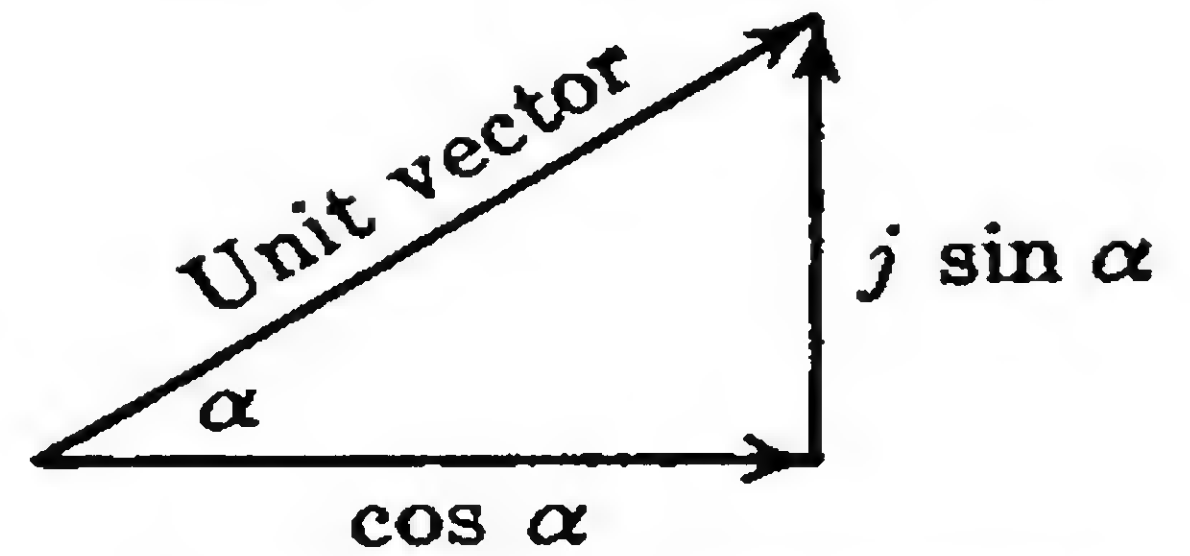

FIG. 40.—Unit vector as geometric sum of  $\cos \alpha + j \sin \alpha$ .

**Relationship between Polar and Rectangular Forms.**—The above relationship provides a method of changing from the rectangular form  $(a + jb)$  to the polar form  $|c|/\alpha$  or vice versa. We can now write  $\underline{\alpha} = \cos \alpha + j \sin \alpha$ , hence,

$$c = |c|/\underline{\alpha} = |c| (\cos \alpha + j \sin \alpha) = |c| \cos \alpha + |c|j \sin \alpha,$$

but  $a = |c| \cos \alpha$   
and  $b = |c| \sin \alpha$

Therefore,  $c = a + jb$

*Example 6.* Given  $c = 20/30^\circ$  (polar form)

Change to rectangular form.

*Solution.* Replacing  $\underline{\alpha}$  by the operator,  $(\cos \alpha + j \sin \alpha)$  and substituting the trigonometric values,

$$c = 20(\cos 30^\circ + j \sin 30^\circ) = 20(0.866 + j0.5)$$

Multiplying,

$$c = 17.32 + j10 \quad (\text{rectangular form}) \quad \text{Ans.}$$

*Example 7.* Give  $c = 30 + j50$  (rectangular form)

Change to polar form.

*Solution.* The magnitude of  $c$  is given by the relationship of Eq. (8). Thus

$$|c| = \sqrt{a^2 + b^2}$$

Substituting numerical values,

$$|c| = \sqrt{(30)^2 + (50)^2}$$

Squaring the terms under the radical and adding,

$$|c| = \sqrt{900 + 2500} = \sqrt{3400}$$

Extracting the square root,

$$|c| = 58.33 \quad (\text{the magnitude})$$

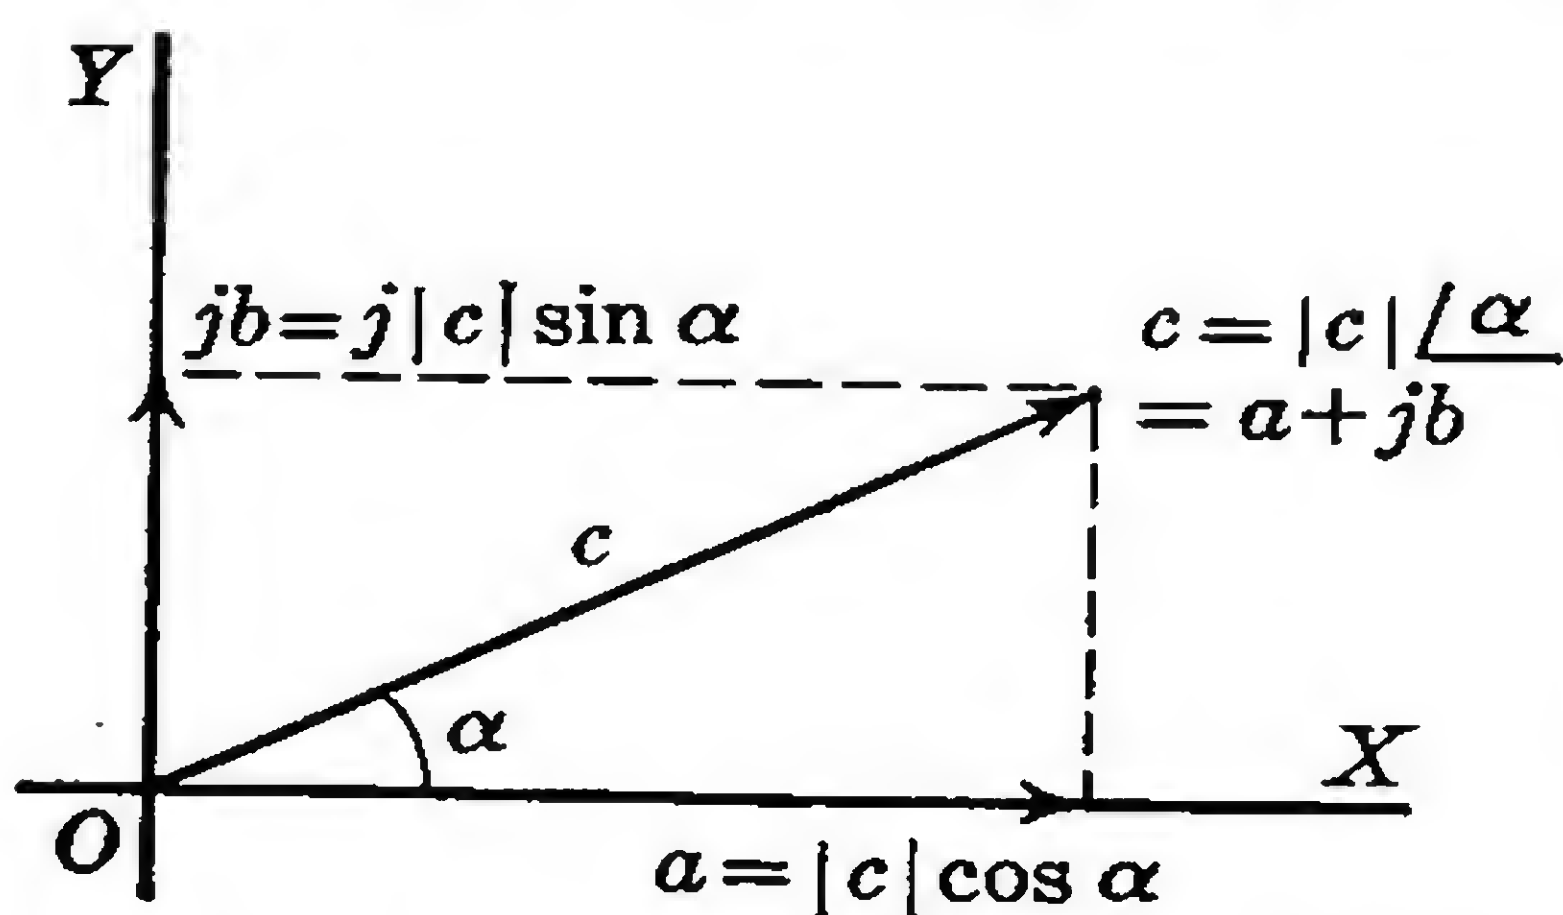

FIG. 41.—Polar and rectangular forms of representing a vector.

The angle is obtained by Eq. (9), thus

$$\tan \alpha = \frac{\text{opp}}{\text{adj}} = \frac{b}{a} = \frac{50}{30} = 1.666$$

From trigonometric tables,

$$\alpha = 59^\circ 02' \quad (\text{approx.}) \quad (\text{the angle})$$

Then the complete answer in polar form is

$$c = |c| \angle \alpha = 58.33 / 59^\circ 02' \quad \text{Ans.}$$

It is important to note that the magnitude

$$\cos \alpha = \cos 59^\circ 02' = 0.514539$$

$$\sin \alpha = \sin 59^\circ 02' = 0.857467$$

Hence,  $a = |c| \cos \alpha$

Substituting numerical values,

$$\begin{aligned} a &= 58.33(0.514539) \\ &= 30, \text{ which checks } \quad \text{Check.} \end{aligned}$$

and,  $b = |c| \sin \alpha$

Substituting numerical values,

$$\begin{aligned} b &= 58.33 (0.857467) \\ &= 50, \text{ which also checks } \quad \text{Check.} \end{aligned}$$

This process of changing from polar to rectangular form and vice versa will be used to advantage later in the study of alternating current circuit theory.

**True Mathematical Polar Form.**—The polar form  $c = |c| \angle \alpha$  has been adopted because of its convenience in expressing a vector which has a *magnitude*  $|c|$  and makes an *angle*  $\alpha$  with the reference axes. From pure mathematics it is easy to develop the exact character of this quantity.

The magnitude of  $e^x$ ,  $\sin x$ , and  $\cos x$  can be defined by the following series:

$$e^x = 1 + x + \frac{x^2}{2} + \frac{x^3}{3} + \frac{x^4}{4} + \frac{x^5}{5} + \dots \quad (13)$$

$$\sin \alpha = \alpha - \frac{\alpha^3}{3} + \frac{\alpha^5}{5} - \dots \quad (14)$$

$$\cos \alpha = 1 - \frac{\alpha^2}{2} + \frac{\alpha^4}{4} - \dots \quad (15)$$

In these equations the three dots at the end indicate that only a few terms of the series are written. Enough terms are usually written to indicate how the rest of the series can be written.

The expressions  $\underline{2}$ ,  $\underline{3}$ , etc., in the denominator mean factorial, thus

$$\underline{2} = 2 \cdot 1 = 2, \quad \underline{3} = 3 \cdot 2 \cdot 1 = 6, \quad \underline{4} = 4 \cdot 3 \cdot 2 \cdot 1 = 24, \text{ etc.}$$

Now if  $j\alpha$  is substituted for  $x$  in Eq. (13), it can be written

$$e^{j\alpha} = 1 + j\alpha + \frac{(j\alpha)^2}{\underline{2}} + \frac{(j\alpha)^3}{\underline{3}} + \frac{(j\alpha)^4}{\underline{4}} + \dots \quad (16)$$

but,

$$\begin{aligned} j &= \sqrt{-1} & j^4 &= 1 \\ j^2 &= -1 & j^5 &= \sqrt{-1} \\ j^3 &= -\sqrt{-1} & j^6 &= -1 \end{aligned}$$

Substituting these values in (16) gives

$$e^{j\alpha} = 1 + j\alpha - \frac{\alpha^2}{\underline{2}} - j\frac{\alpha^3}{\underline{3}} + \frac{\alpha^4}{\underline{4}} + j\frac{\alpha^5}{\underline{5}} - \dots \quad (17)$$

Separating the  $j$  terms, gives

$$e^{j\alpha} = \left(1 - \frac{\alpha^2}{\underline{2}} + \frac{\alpha^4}{\underline{4}} - \dots\right) + j\left(\alpha - \frac{\alpha^3}{\underline{3}} + \frac{\alpha^5}{\underline{5}} - \dots\right) \quad (18)$$

But the two series of (18) are the same as those of (14) and (15), hence,

$$e^{j\alpha} = \cos \alpha + j \sin \alpha \quad (19)$$

This shows that *the true mathematical polar form* of  $c$  is  $|c|e^{j\alpha}$  where  $e = 2.718 \dots$  the base of natural logarithms. This establishes the exponential character of the angle, showing why the angles are added when vectors are multiplied. The vector  $c$  can be written in several forms, as follows:

$$\begin{aligned} c &= |c|\underline{\angle}\alpha = |c|e^{j\alpha} = |c|(\cos \alpha + j \sin \alpha) \\ &= |c| \cos \alpha + j|c| \sin \alpha \end{aligned} \quad (20)$$

**Multiplication of Vectors in Rectangular Form.**—The multiplication of vectors in rectangular form is more cumbersome than the multiplication of vectors in polar form. Usually it is easier to change from rectangular to polar form for multiplication than to perform the multiplication in rectangular form. However, in some cases, such as certain theoretical developments, multiplication in rectangular form is valuable, and it should therefore be understood by the student.

*Illustration.* Multiply  $(a + jb)(c + jd)$ .

*Solution.* Performing the algebraic multiplication, as outlined in Chap. 3, results in

$$(a + jb)(c + jd) = (ac - bd) + j(ad + bc) \quad (21)$$

In checking this equation the student must remember that  $j^2$  can be replaced by  $-1$ .

*Example 8.* Given:

$$\begin{aligned} a + jb &= 3 + j4 = 5 \angle 53^\circ 08' \\ c + jd &= 8 + j6 = 10 \angle 36^\circ 52' \end{aligned}$$

First multiply these vectors in rectangular form and then check by using polar form.

*Solution.* By rectangular multiplication,

$$\begin{aligned} 3 + j4 \quad 8 + j6 &= 3 \cdot 8 - 4 \cdot 6 - j \cdot 3 \cdot 6 - j \cdot 4 \cdot 8 \\ &= 0 - j50 = 50 \angle 90^\circ \quad \text{Ans.} \end{aligned}$$

Checking by polar multiplication,

$$5 \angle 53^\circ 08' \quad 10 \angle 36^\circ 52' = 50 \angle 90^\circ = 0 + j50 \quad \text{Check.}$$

**Division of Vectors in Rectangular Form.**—The division of vectors in rectangular form is even more cumbersome than their multiplication in that form. In order to divide two vectors, it is necessary to rationalize the fraction, as follows:

*Illustration.* Divide  $a + jb$  by  $c + jd$ .

*Solution.* First, set up the problem in fraction form.

Second, multiply both numerator and denominator by the denominator with the  $j$  term sign changed.

Third, multiply out both numerator and denominator.

The operations are illustrated as follows:

$$\frac{a + jb}{c + jd} = \frac{(a + jb)(c - jd)}{(c + jd)(c - jd)} = \frac{(ac + bd) + j(bc - ad)}{c^2 + d^2}$$

The term  $c - jd$  is called the "conjugate" of  $c + jd$  because it has the same magnitude but its angle is the negative of  $c + jd$ . The product of a number by its conjugate is a real number since the  $j$  term disappears. This removes all  $j$  operators from the denominator and makes a rationalized complex number.

Fourth, the quotient can be written in rectangular form as follows:

$$\frac{a + jb}{c + jd} = \frac{ac + bd}{c^2 + d^2} + j \frac{bc - ad}{c^2 + d^2} \quad (22)$$

**Example 9.** Given:  $a + jb = 3 + j4 = 5/\underline{53^\circ 08'}$

$$c + jd = 8 + j6 = 10/\underline{36^\circ 52'}$$

First divide these vectors in rectangular form and then check by using polar form.

*Solution.*

$$\begin{aligned}\frac{3 + j4}{8 + j6} &= \frac{(3 + j4)(8 - j6)}{(8 + j6)(8 - j6)} = \frac{24 + 24 + j(32 - 18)}{(64) + (36)} = \frac{48 + j14}{100} \\ &= 0.48 + j0.14 = 0.50/\underline{16^\circ 16'} \quad \text{Ans.}\end{aligned}$$

Checking by polar division,

$$\frac{5/\underline{53^\circ 08'}}{10/\underline{36^\circ 52'}} = 0.5/\underline{16^\circ 16'} = 0.48 + j0.14 \quad \text{Check.}$$

### Exercises

1. Write  $c = |c|/\underline{\alpha} = 50/\underline{30^\circ}$  in rectangular form,  $(a + jb)$ .
2. Write  $c = |c|/\underline{\alpha} = 10/\underline{300^\circ}$  in rectangular form.
3. Write  $c = a + jb = -20 + j30$  in polar form.
4. Multiply  $A = 25/\underline{15^\circ}$  by  $B = 60/\underline{80^\circ}$ .
5. Divide  $A = 25/\underline{15^\circ}$  by  $B = 60/\underline{80^\circ}$  and express in rectangular form.

## CHAPTER 8

### CURVES AND GRAPHS

Curves and graphs are widely used to show relationships clearly. They bring together the principles of both algebra and geometry in a pictorial way that greatly increases their utility.

A curve is a smooth line representing the relationship between two or more variables. Such curves are often used by engineers for visualizing design relationships. A common procedure to obtain a curve is to vary one quantity and note the simultaneous values of the other quantities. After sufficient data have been obtained, the points are plotted on appropriate graph paper and a smooth line is drawn through them to show the relationship. Algebraic equations can also be solved by plotting curves. These methods are not so readily adapted to high accuracy as pure algebraic methods, yet they often permit the solution of problems so difficult that pure algebraic methods become impractical. A curve is a special type of graph. A graph is a pictorial representation showing the relationship between two or more quantities. Graphs are used extensively by newspapers, magazines, technical journals, engineers, and business people concerned with relative values. In one of the most common types of graphs, the adjacent points are joined by straight lines. This should be done unless there is a good reason for drawing a smooth curve through them. Common graphs of this type are those that show temperature plotted against time, stock market values plotted daily, and volume of business plotted monthly. Business men often base important decisions upon information obtained from graphs.

Engineering curves are usually plotted on cross-section paper. Cross-section paper comes in a variety of forms to meet various needs. Some of the more common forms are rectangular coordinate paper, logarithmic paper, and polar coordinate paper.

**System of Rectangular Coordinates.**—We have already been using a system of coordinates. Such a system is shown in

Fig. 42. Here we have the  $x$ - and  $y$ -axes at right angles. Let each axis be considered as a number scale with the intersection of the axes as the zero point of each scale. The point  $P$ , any point on the plane, can be located by dropping perpendiculars to the two axes as shown in Fig.

42. Let  $x$  represent the distance to the  $y$ -axis and  $y$  represent the distance to the  $x$ -axis. The point  $P$  given in Fig. 42 can be represented by the symbol  $(3, -2)$  which means that starting at the origin the point  $P$  is located by going a distance  $+3$  along the positive  $x$ -axis and then going down a distance of

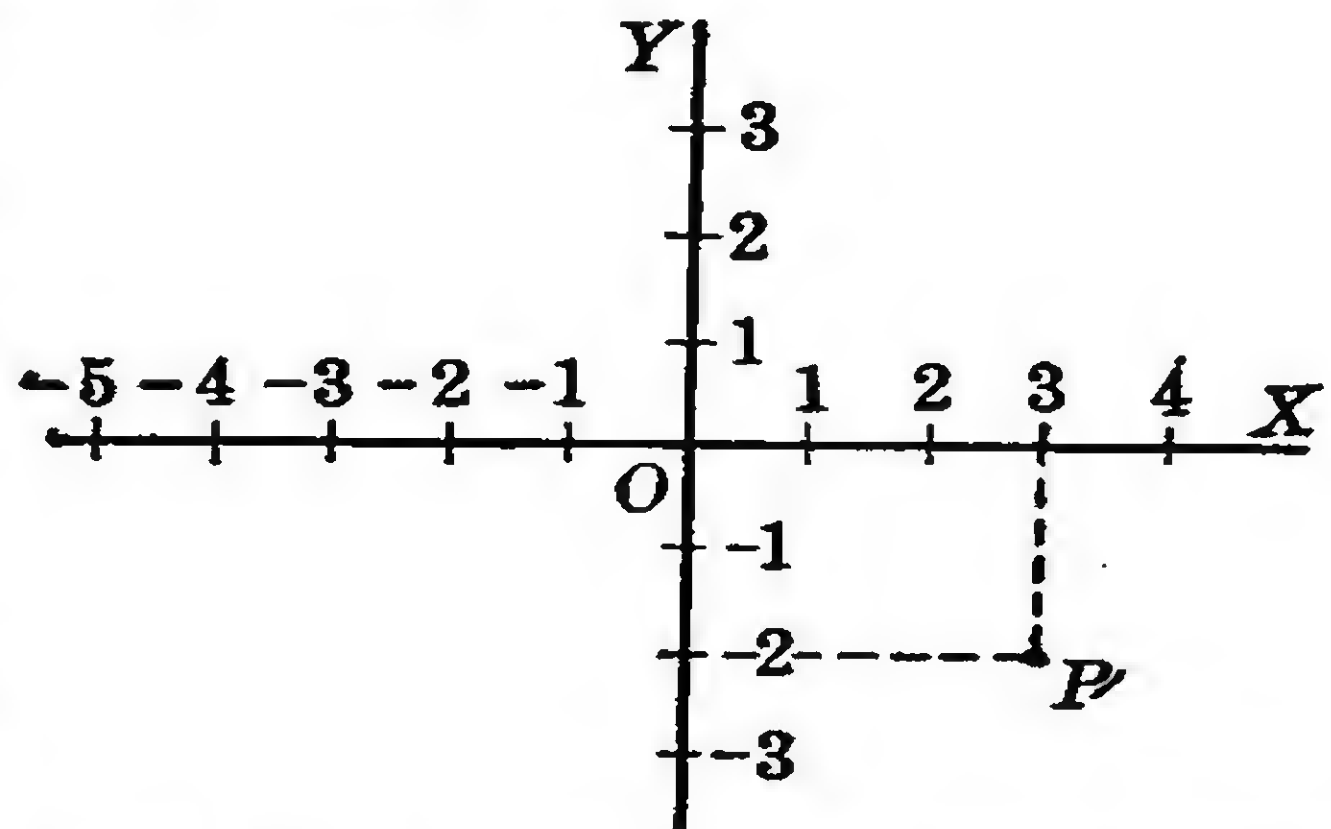

FIG. 42.—Rectangular coordinate system.

$-2$  parallel to the negative  $y$ -axis. The  $+3$  and  $-2$  are often referred to as the coordinates of the point  $P$ .

In order to make it easy to locate any such point  $P$  (the point  $P$  is said to be plotted), it is very convenient to use cross-section

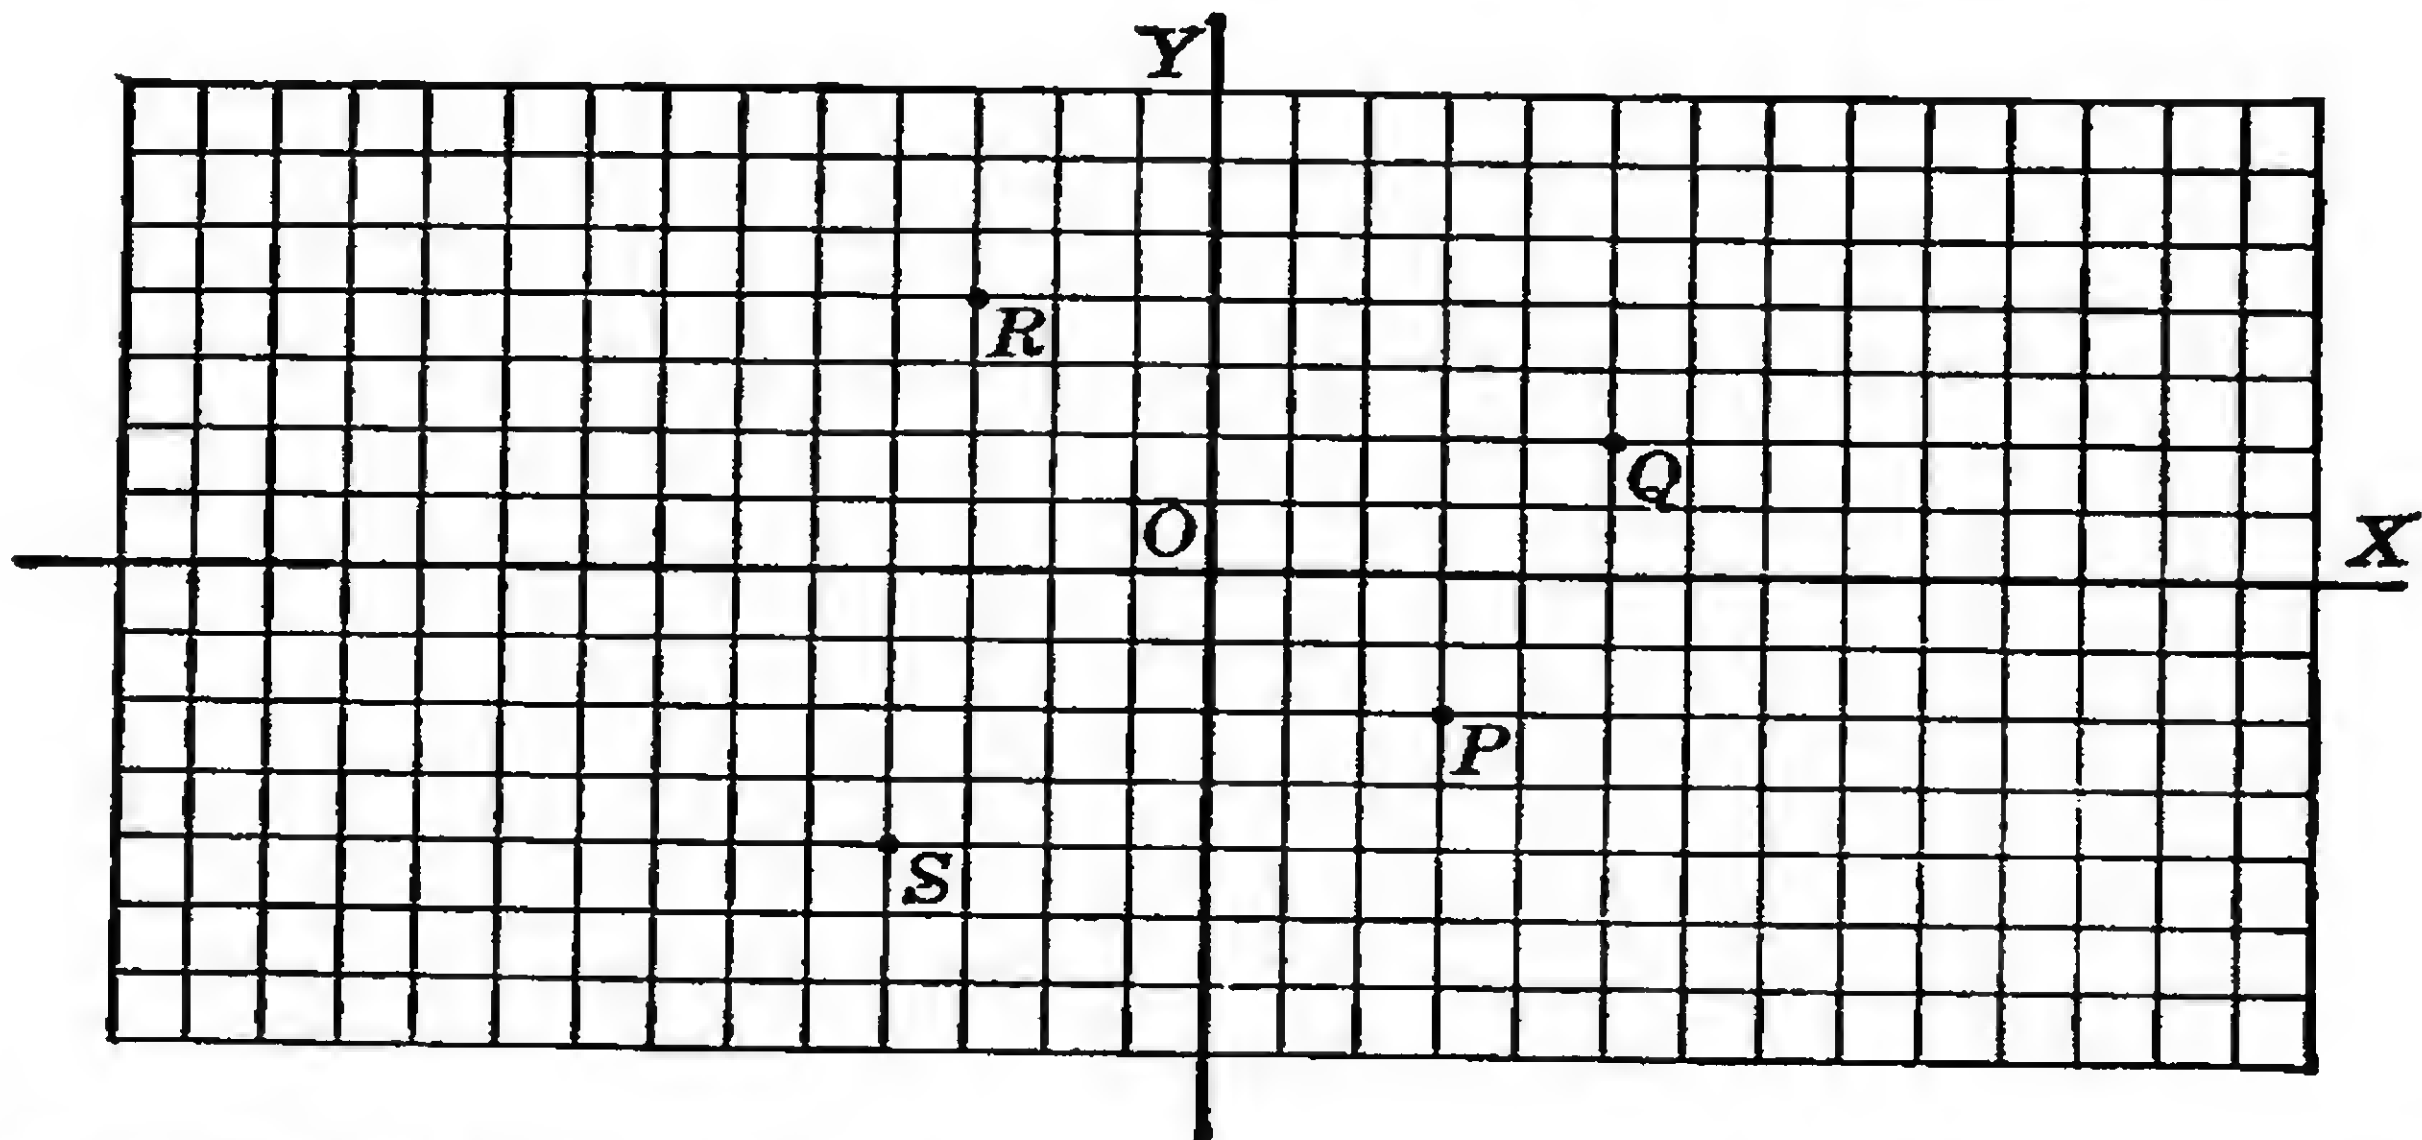

FIG. 43.—Rectangular coordinate system superimposed on cross-section paper, as shown in Fig. 43. Such paper is made by ruling off the plane into equal squares with sides parallel to the axes. The side of a square may be taken as unit length to represent a number.

If we do not know the coordinates of a point  $P$  we can refer to them as  $(x, y)$ . In the above case  $x = +3$  and  $y = -2$  and hence the coordinates are  $(3, -2)$ . *Note:* The first number in the parenthesis is always the  $x$  dimension and the second number is the  $y$ -dimension. The point is often subscribed with the

symbol  $(x, y)$ , thus:  $P_{(x,y)}$ . To illustrate, the point  $P_{(3,-2)}$  definitely locates the point  $P$  on the plane shown in Fig. 43.

Figure 43 illustrates the way to place the axes if all four quadrants are to be used in plotting a curve. The point  $Q_{(x,y)}$  shown in Fig. 43 is located by going  $+5$  units along the positive  $x$ -axis and  $+2$  units parallel to the positive  $y$ -axis. Therefore *both numbers are positive in the first quadrant*. Thus,  $Q$  is represented by the symbol  $(5, 2)$ . To locate a point  $R_{(x,y)}$  in the second quadrant we must go  $-3$  units along the negative  $x$ -axis and up  $+4$  units parallel to the positive  $y$ -axis. *The  $x$  value is negative and the  $y$  value is positive in the second quadrant*. Thus,  $R_{(x,y)}$  is represented by the symbol  $(-3, 4)$ . To locate a point  $S_{(x,y)}$  in the third quadrant we must go  $-4$  units along the negative  $x$ -axis and  $-4$  units along (or parallel) to the negative  $y$ -axis. Therefore, *both numbers are negative in the third quadrant*. Thus  $S_{(x,y)}$  is represented by the symbol  $(-4, -4)$ . The point  $P_{(x,y)}$  in the *fourth quadrant* is represented by a *positive  $x$  value and a negative  $y$  value*. As mentioned above the symbol in this case for  $P_{(x,y)}$  is  $(3, -2)$ .

RECTANGULAR COORDINATE SIGNS

Quadrant	Sign of $X$	Sign of $Y$
First	+	+
Second	-	+
Third	-	-
Fourth	+	-

It should now be clear to the student that every point on the plane can be found by substituting definite values for  $x$  and  $y$  in the symbol  $(x,y)$ .

An illustration of curves in all four quadrants is found in magnetic circuit theory. The curves are known as  $B$ - $H$  curves where  $B$  represents the lines of induction and  $H$  represents the magnetic field strength. In Fig. 44 the magnetic force  $H$  is along the  $x$ -axis and the magnetization  $B$  is along the  $y$ -axis.

Usually it is not necessary to use all four quadrants to plot a curve. When only one quadrant is needed the usual practice is to use the first. In this case all numbers will be positive. When negative numbers are involved, other quadrants must be used. Usually some study of the problem will result in a judicious selection of quadrants.

Vacuum tube characteristic curves furnish a good illustration of using the first and second quadrants. When the plate voltage is held constant, the plate current can be plotted as a function of the grid voltage. This means that a current meter is placed in the plate lead and a volt meter connected from the grid to the cathode or filament. The grid voltage is changed in steps and for each grid voltage reading a corresponding plate current reading is recorded. These coordinate points are plotted on cross-section paper marked off in the first and second quadrants. Such curves can be found in vacuum-tube books.

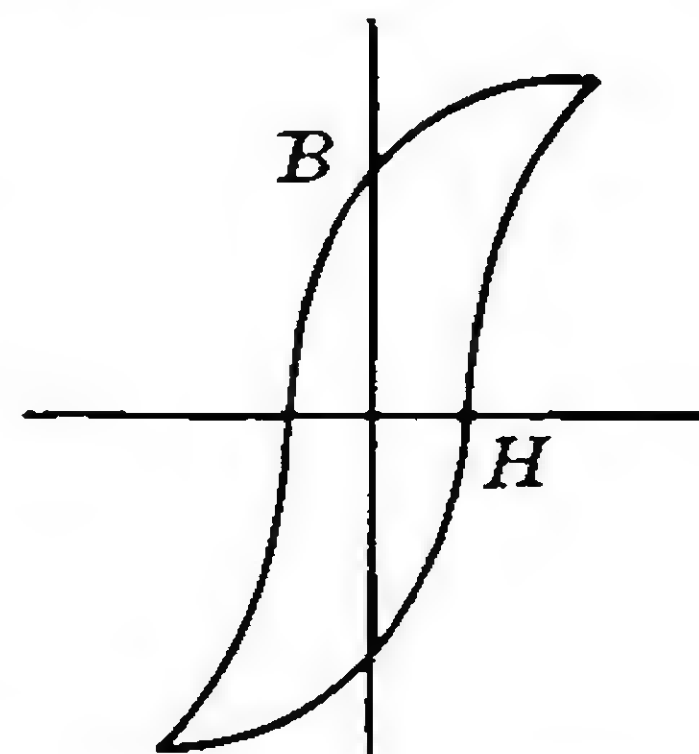

FIG. 44.—Typical *B-H* curve.

It will be noted that the curves found in vacuum-tube books are smooth lines. This means that the values change gradually between points. When taking data to obtain such a curve, any irregular points should be checked to be sure that they are not errors in taking the readings. It is always a good practice to

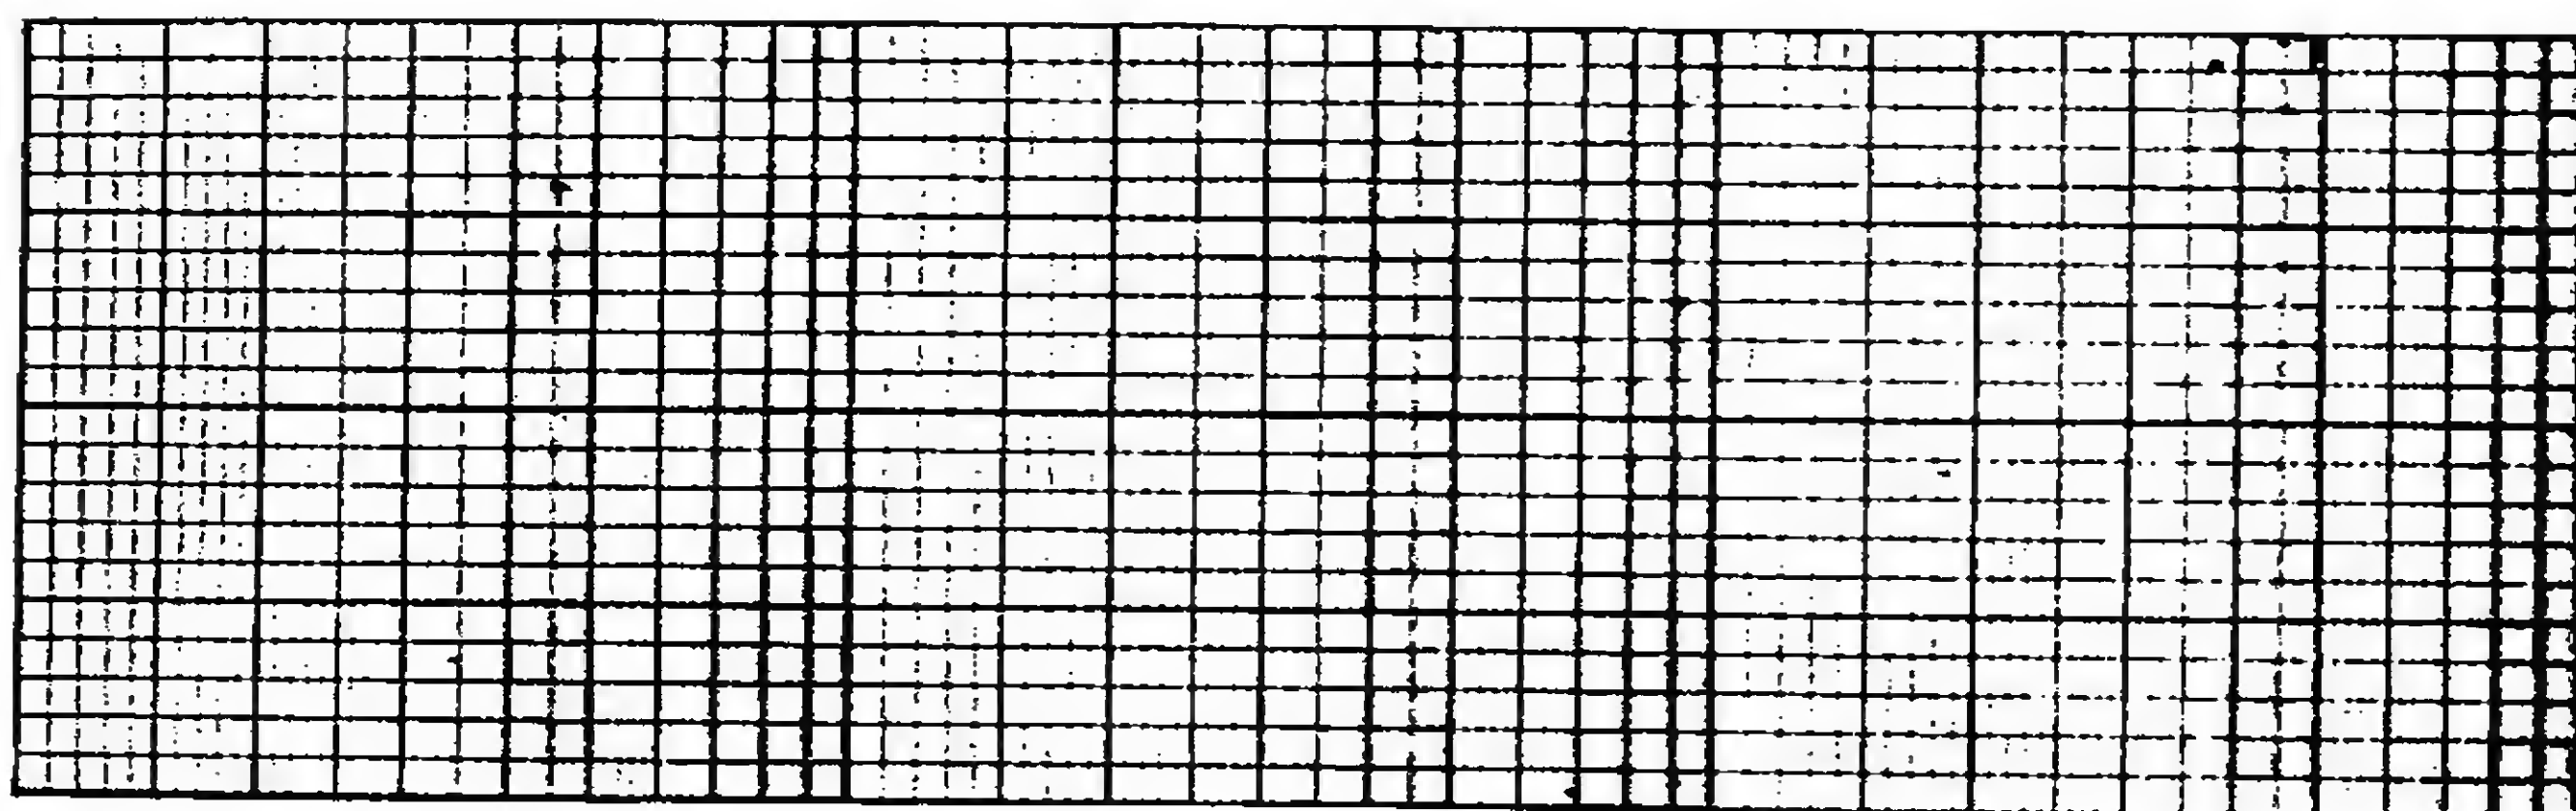

FIG. 45.—Three-cycle semilogarithmic graph paper.

plot the curve as the data is taken, so any irregularities can be checked before destroying the experimental setup.

When a wide range of values are to be plotted it is often desirable to use a logarithmic scale or scales. This type of paper has other distinct advantages, such as that of keeping the percentage accuracy the same for all values. An illustration of the use of this type of paper is to show the frequency characteristics of an audio amplifier. Semilogarithmic cross-section paper is generally used for these curves. It has a logarithmic scale along only one side, as shown in Fig. 45.

The  $y$ -axis values are usually marked voltage amplification, or  $dh$  gain. The  $x$ -axis values are marked in cycles per second along

a logarithmic scale. Typical examples are to be found in the other books of this series.

Since curves are so frequent in radio and communication engineering practice, the student should have a *thorough* understanding of how to make and use them. It will often require considerable ingenuity to select proper scales so that the curves will not be crowded. The following pointers are given to guide the student in making *any* graphical representations.

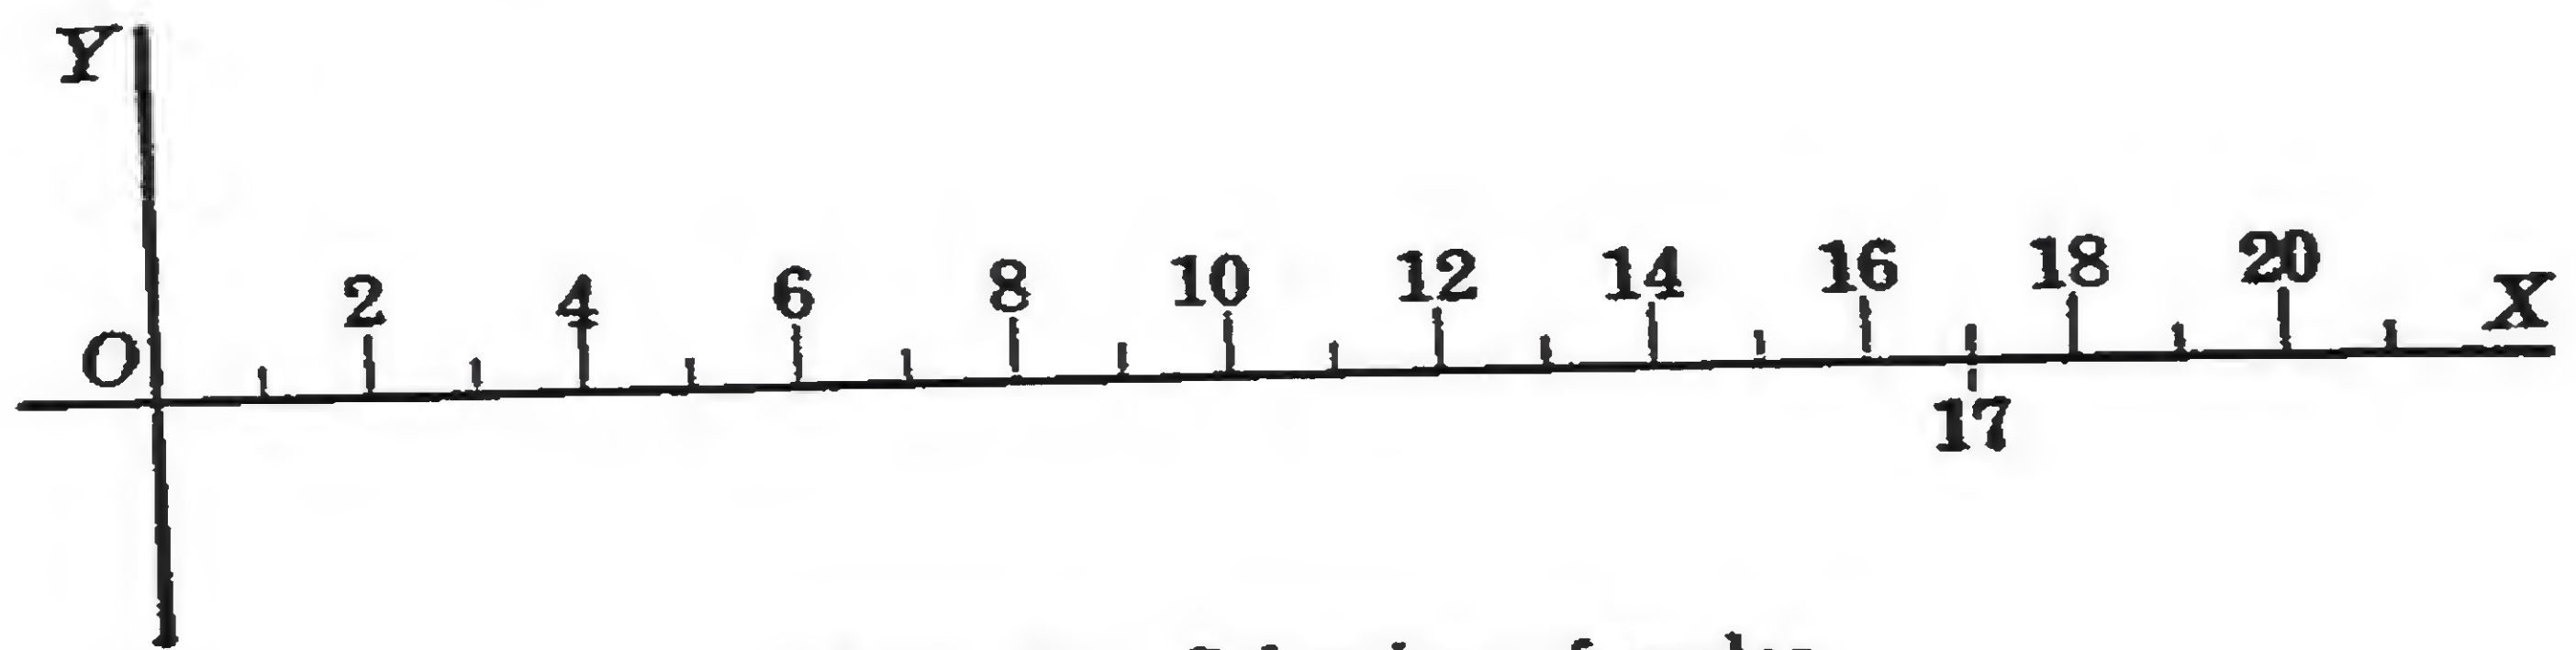

FIG. 46.—Selection of scales.

**Scale Selection.**—A scale should be selected so that the curve will cover the limits of the paper. However, care should be taken to keep from using fractional divisions, as this will make the curve difficult to plot. To illustrate, suppose we have a curve having a maximum  $x$  value of 17 and the cross-section paper has only 10 lines. If 17 is plotted on the tenth line, each line will represent 1.7 and it will be difficult to find points from 0 to 17. If each division were marked to represent 2, the 17 would not cover the whole scale but it would be easy to plot the points. This is illustrated in Fig. 46. Each major division is marked with even numbers.

**Desirable Slope.**—The scales should be selected so that any change in slope can be easily and accurately determined. Also, if the slope is too steep or not steep enough, the readings on one or the other scale will be crowded and thus the accuracy in reading will be lowered. Therefore, the scales should be selected so that the curve is as nearly 45 degrees with the  $x$ -axis as practicable. This is especially true if the curve is a straight line. *Note:* A curve is a general expression for a line of any shape, so a straight line is a curve. As an example, a straight-line capacity capacitor gives a straight-line curve when capacity is plotted against the dial setting.

Not only should the proper slope of a curve be obtained, but the student should be familiar with just how it can be determined. As a practical illustration, consider the curve in Fig. 47, which

is the plate characteristic for a type 250 vacuum tube with zero grid voltage. It is desired to find the plate conductance of the tube when the plate current varies from 60 to 80 mls. As will be given later, the plate conductance is the slope of the  $I_p - E_p$  characteristic curve as presented in Fig. 47. In other words, the slope of a curve is the angle it makes with the positive  $x$ -axis. It can also be thought of as the tangent of the angle the line makes with the positive  $x$ -axis. In this particular case the slope is  $\tan \theta$  given in Fig. 47, but  $\tan \theta = \text{opposite side}/\text{adjacent side}$ . Perhaps the best way to determine this is to form the triangle as shown in Fig. 47. The opposite side has a length of  $80 - 60 = 20$  mls change in plate current. The adjacent side has a length of  $190 - 160 = 30$  volts. The slope of this curve is then

$$\begin{aligned}\text{Slope} &= \frac{I_2 - I_1}{E_2 - E_1} = \frac{0.08 - 0.06}{190 - 160} \\ &= \frac{0.02}{30} = 0.000666 \text{ mho}, = 666 \mu \text{ mho}\end{aligned}$$

which is a measure of the plate conductance of the vacuum tube.

The slope of a curve is of great importance in many engineering problems. *Calculus*, for example, is based upon this fundamental idea, so the student should learn all he can about it.

In the above illustration we had a change in plate current for a given change in plate voltage. A more familiar ratio is that of the miles covered in an hour, commonly called "miles per hour." Many engineering problems have to deal with ratios and each of these ratios or rates can be represented graphically as the slope of a curve.

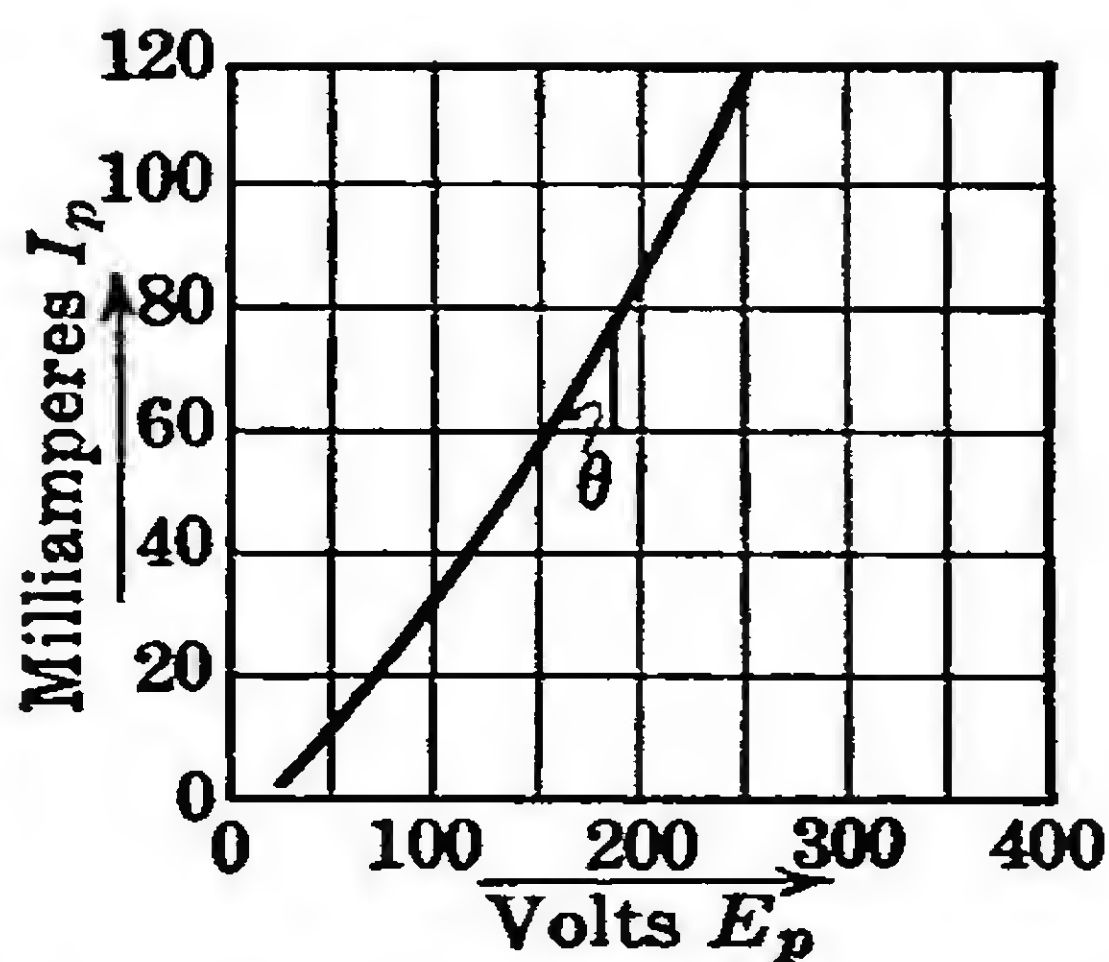

FIG. 47.—Slope determination.

**Many Points Are Desirable.**—When taking data to plot a curve it is advantageous to plot many points. This is especially true when the values do not fall on a smooth curve. The general practice in such cases is to plot many points and then draw a smooth curve through the greatest number of points in order to minimize any errors in obtaining the data. The simplest curve to plot is a straight line, which requires a minimum of only two points.

**Curve Labeling.**—Every curve should be titled on the curve sheet with the name of the curve, the date it was taken, and by

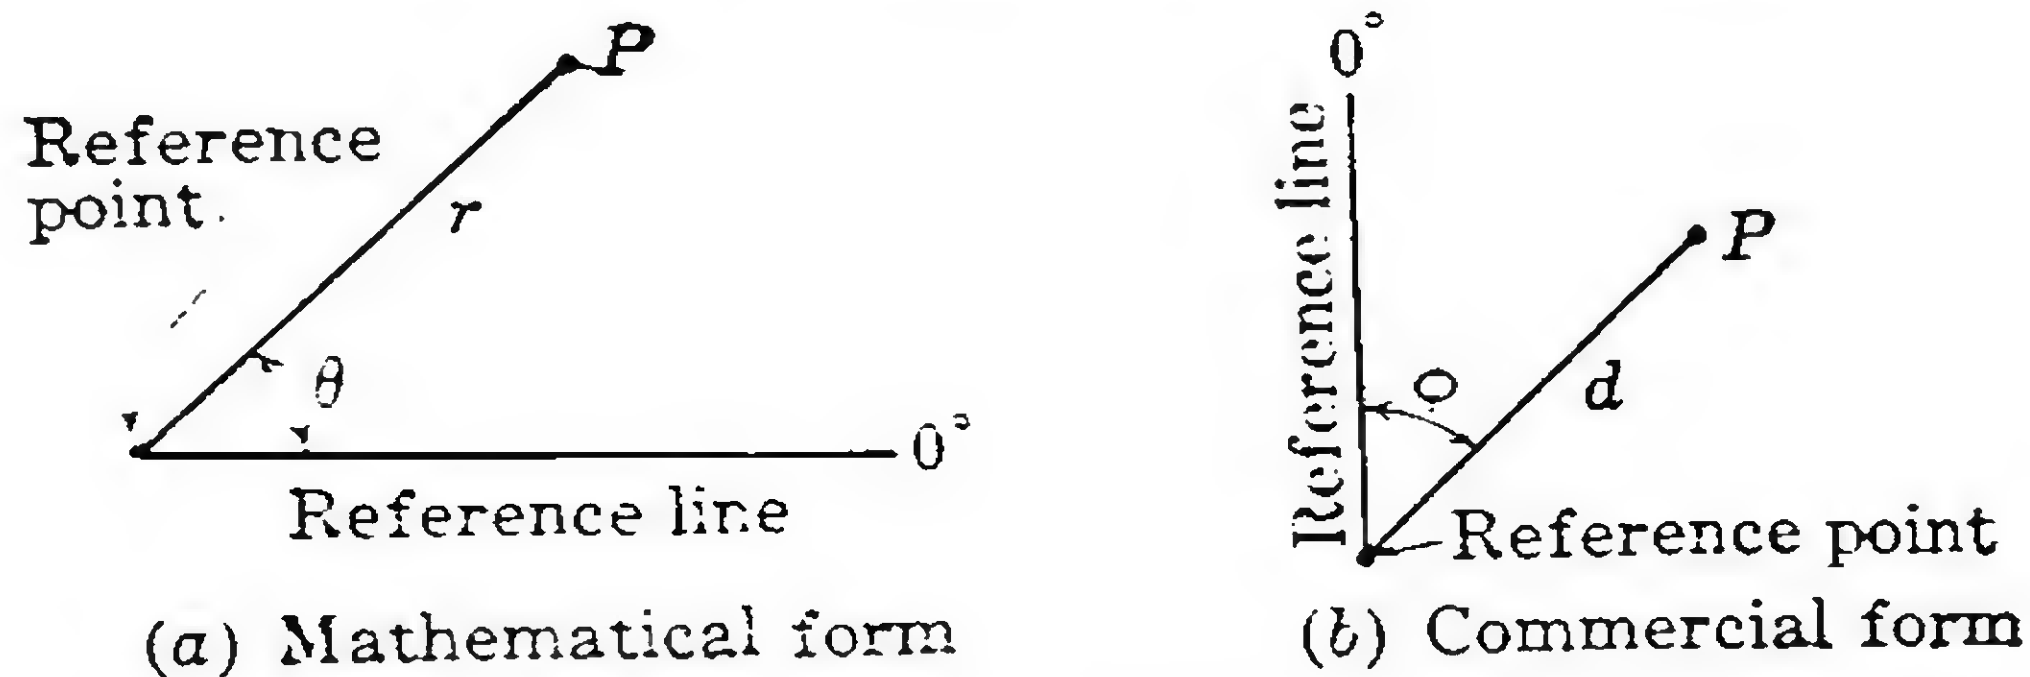

FIG. 48.—Polar coordinate systems.

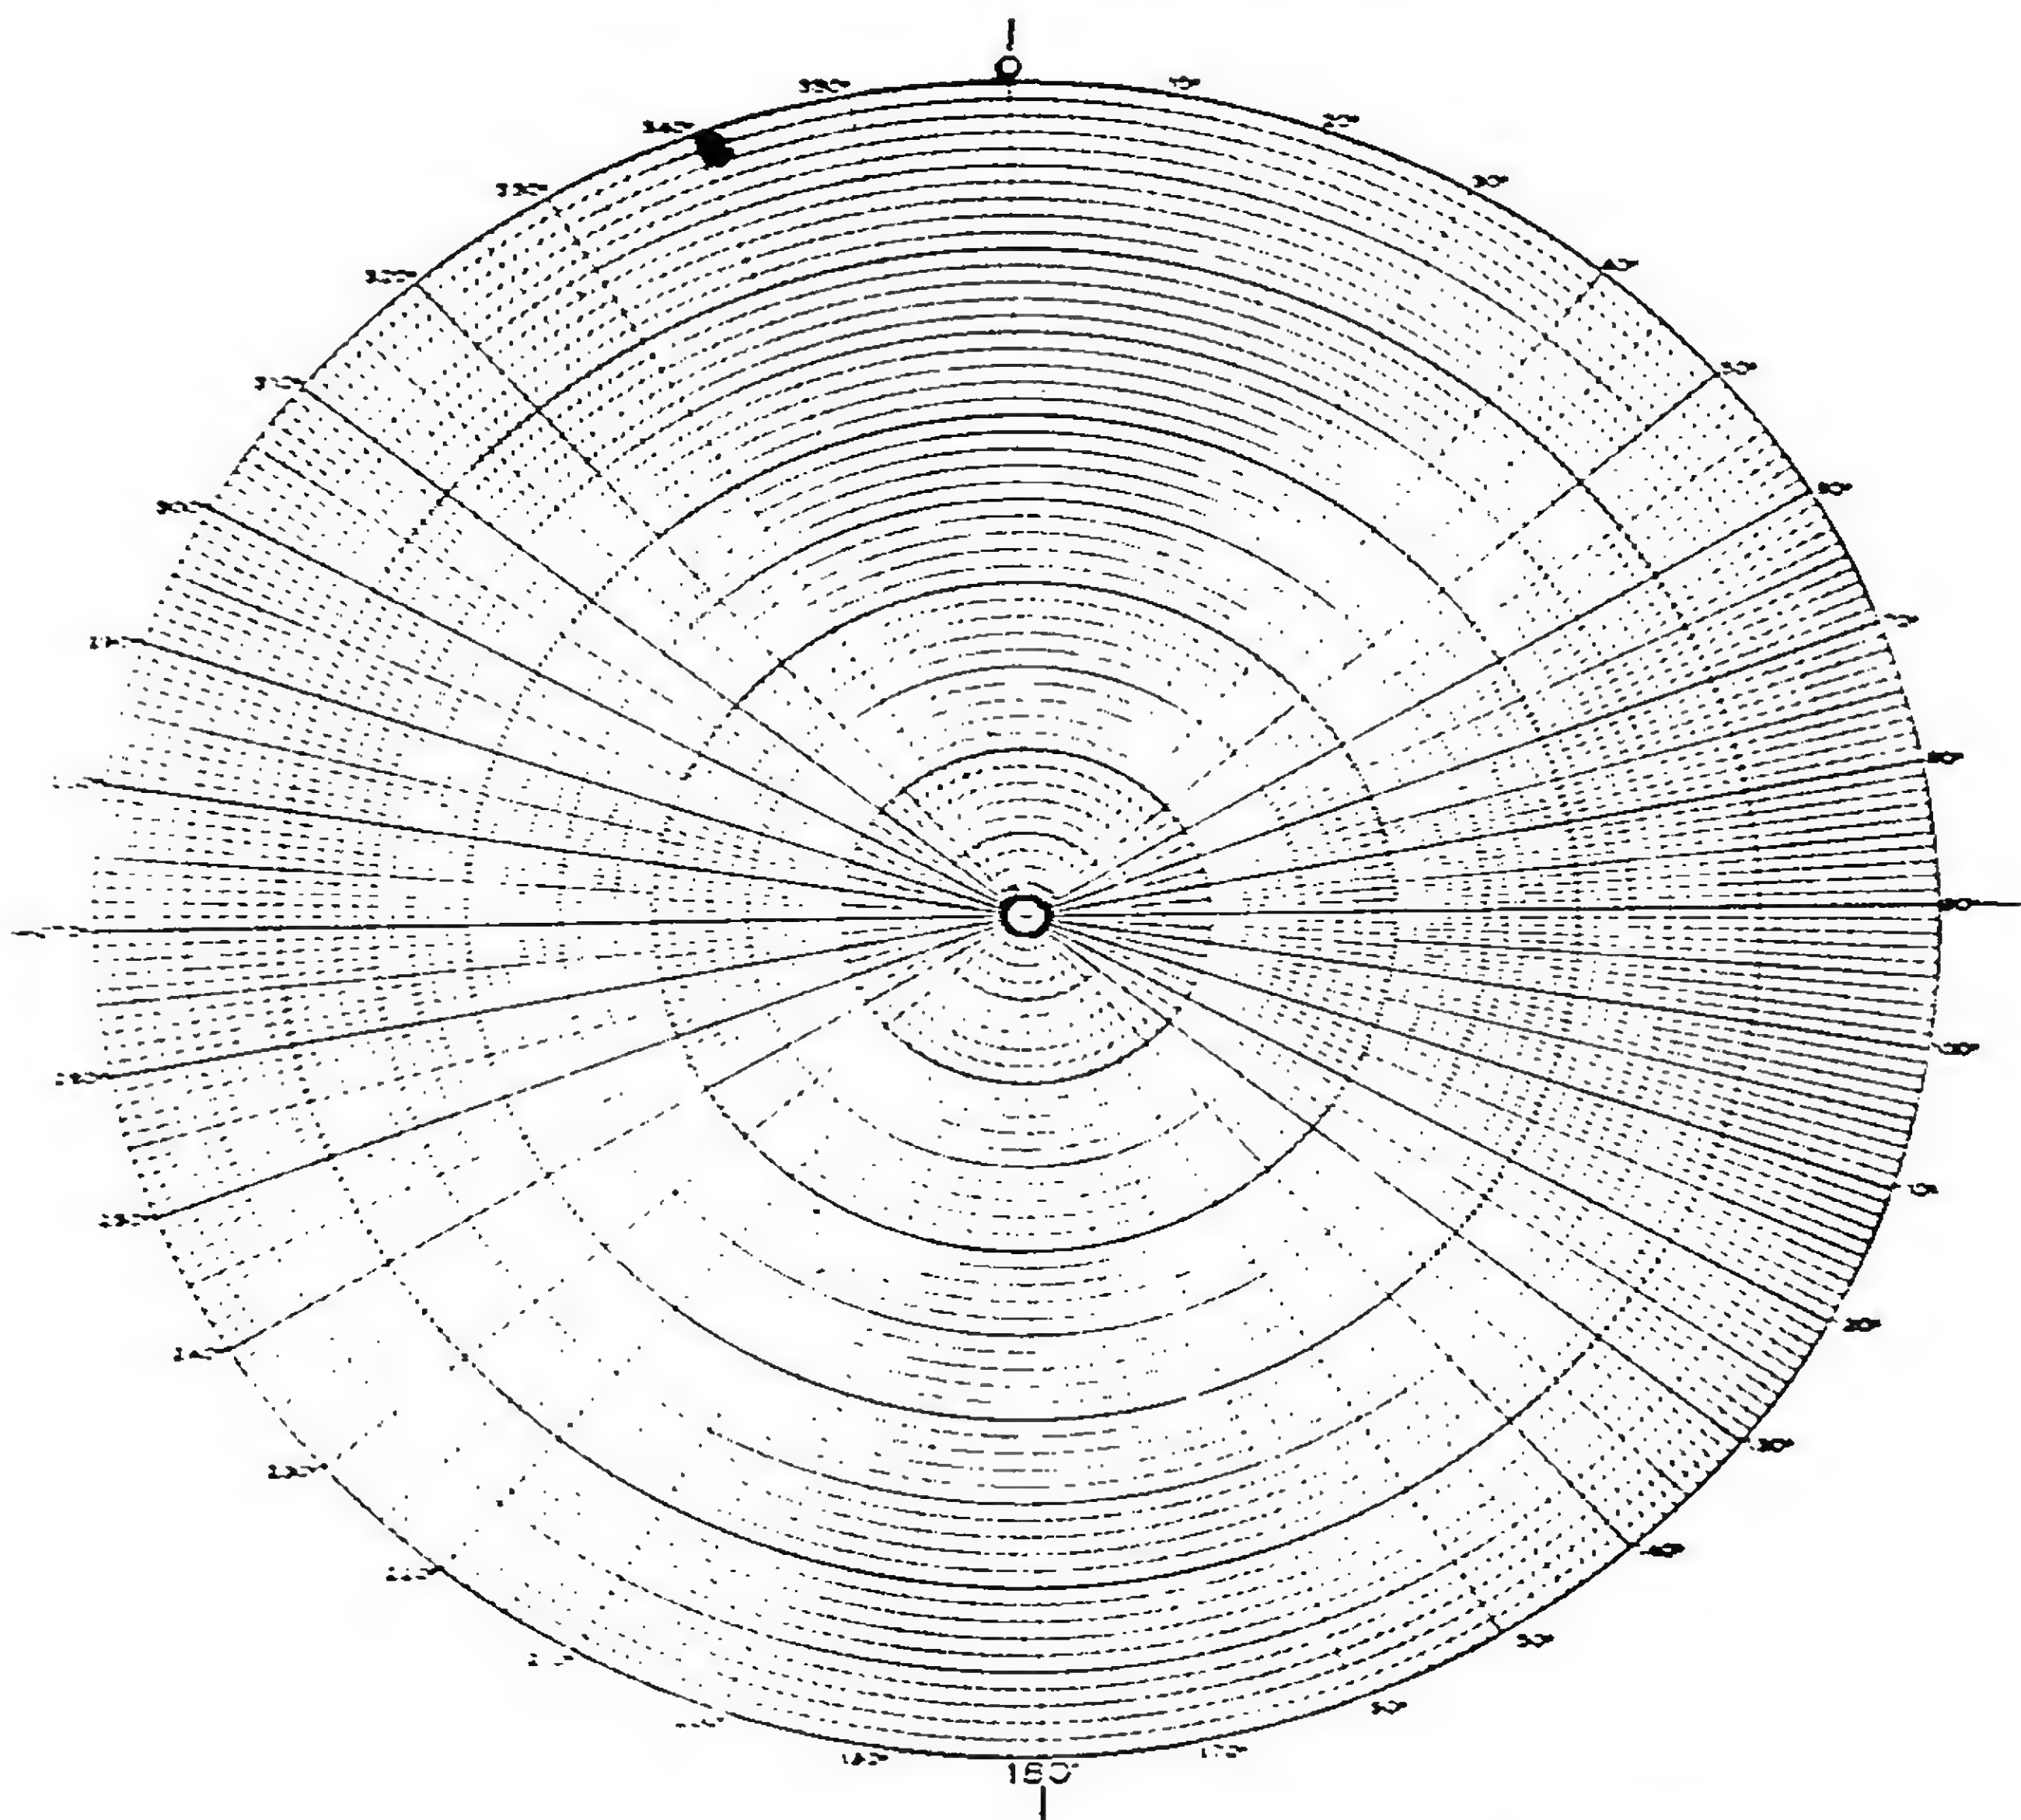

FIG. 49. A commercial form of polar coordinate paper.

whom it was taken. Also it is very advantageous to show a wiring diagram if it pertains to any electrical circuit and the serial numbers of any pieces that are being calibrated, etc. It is a help to record the data from which the curve was plotted on the curve sheet. In other words, put on the sheet everything

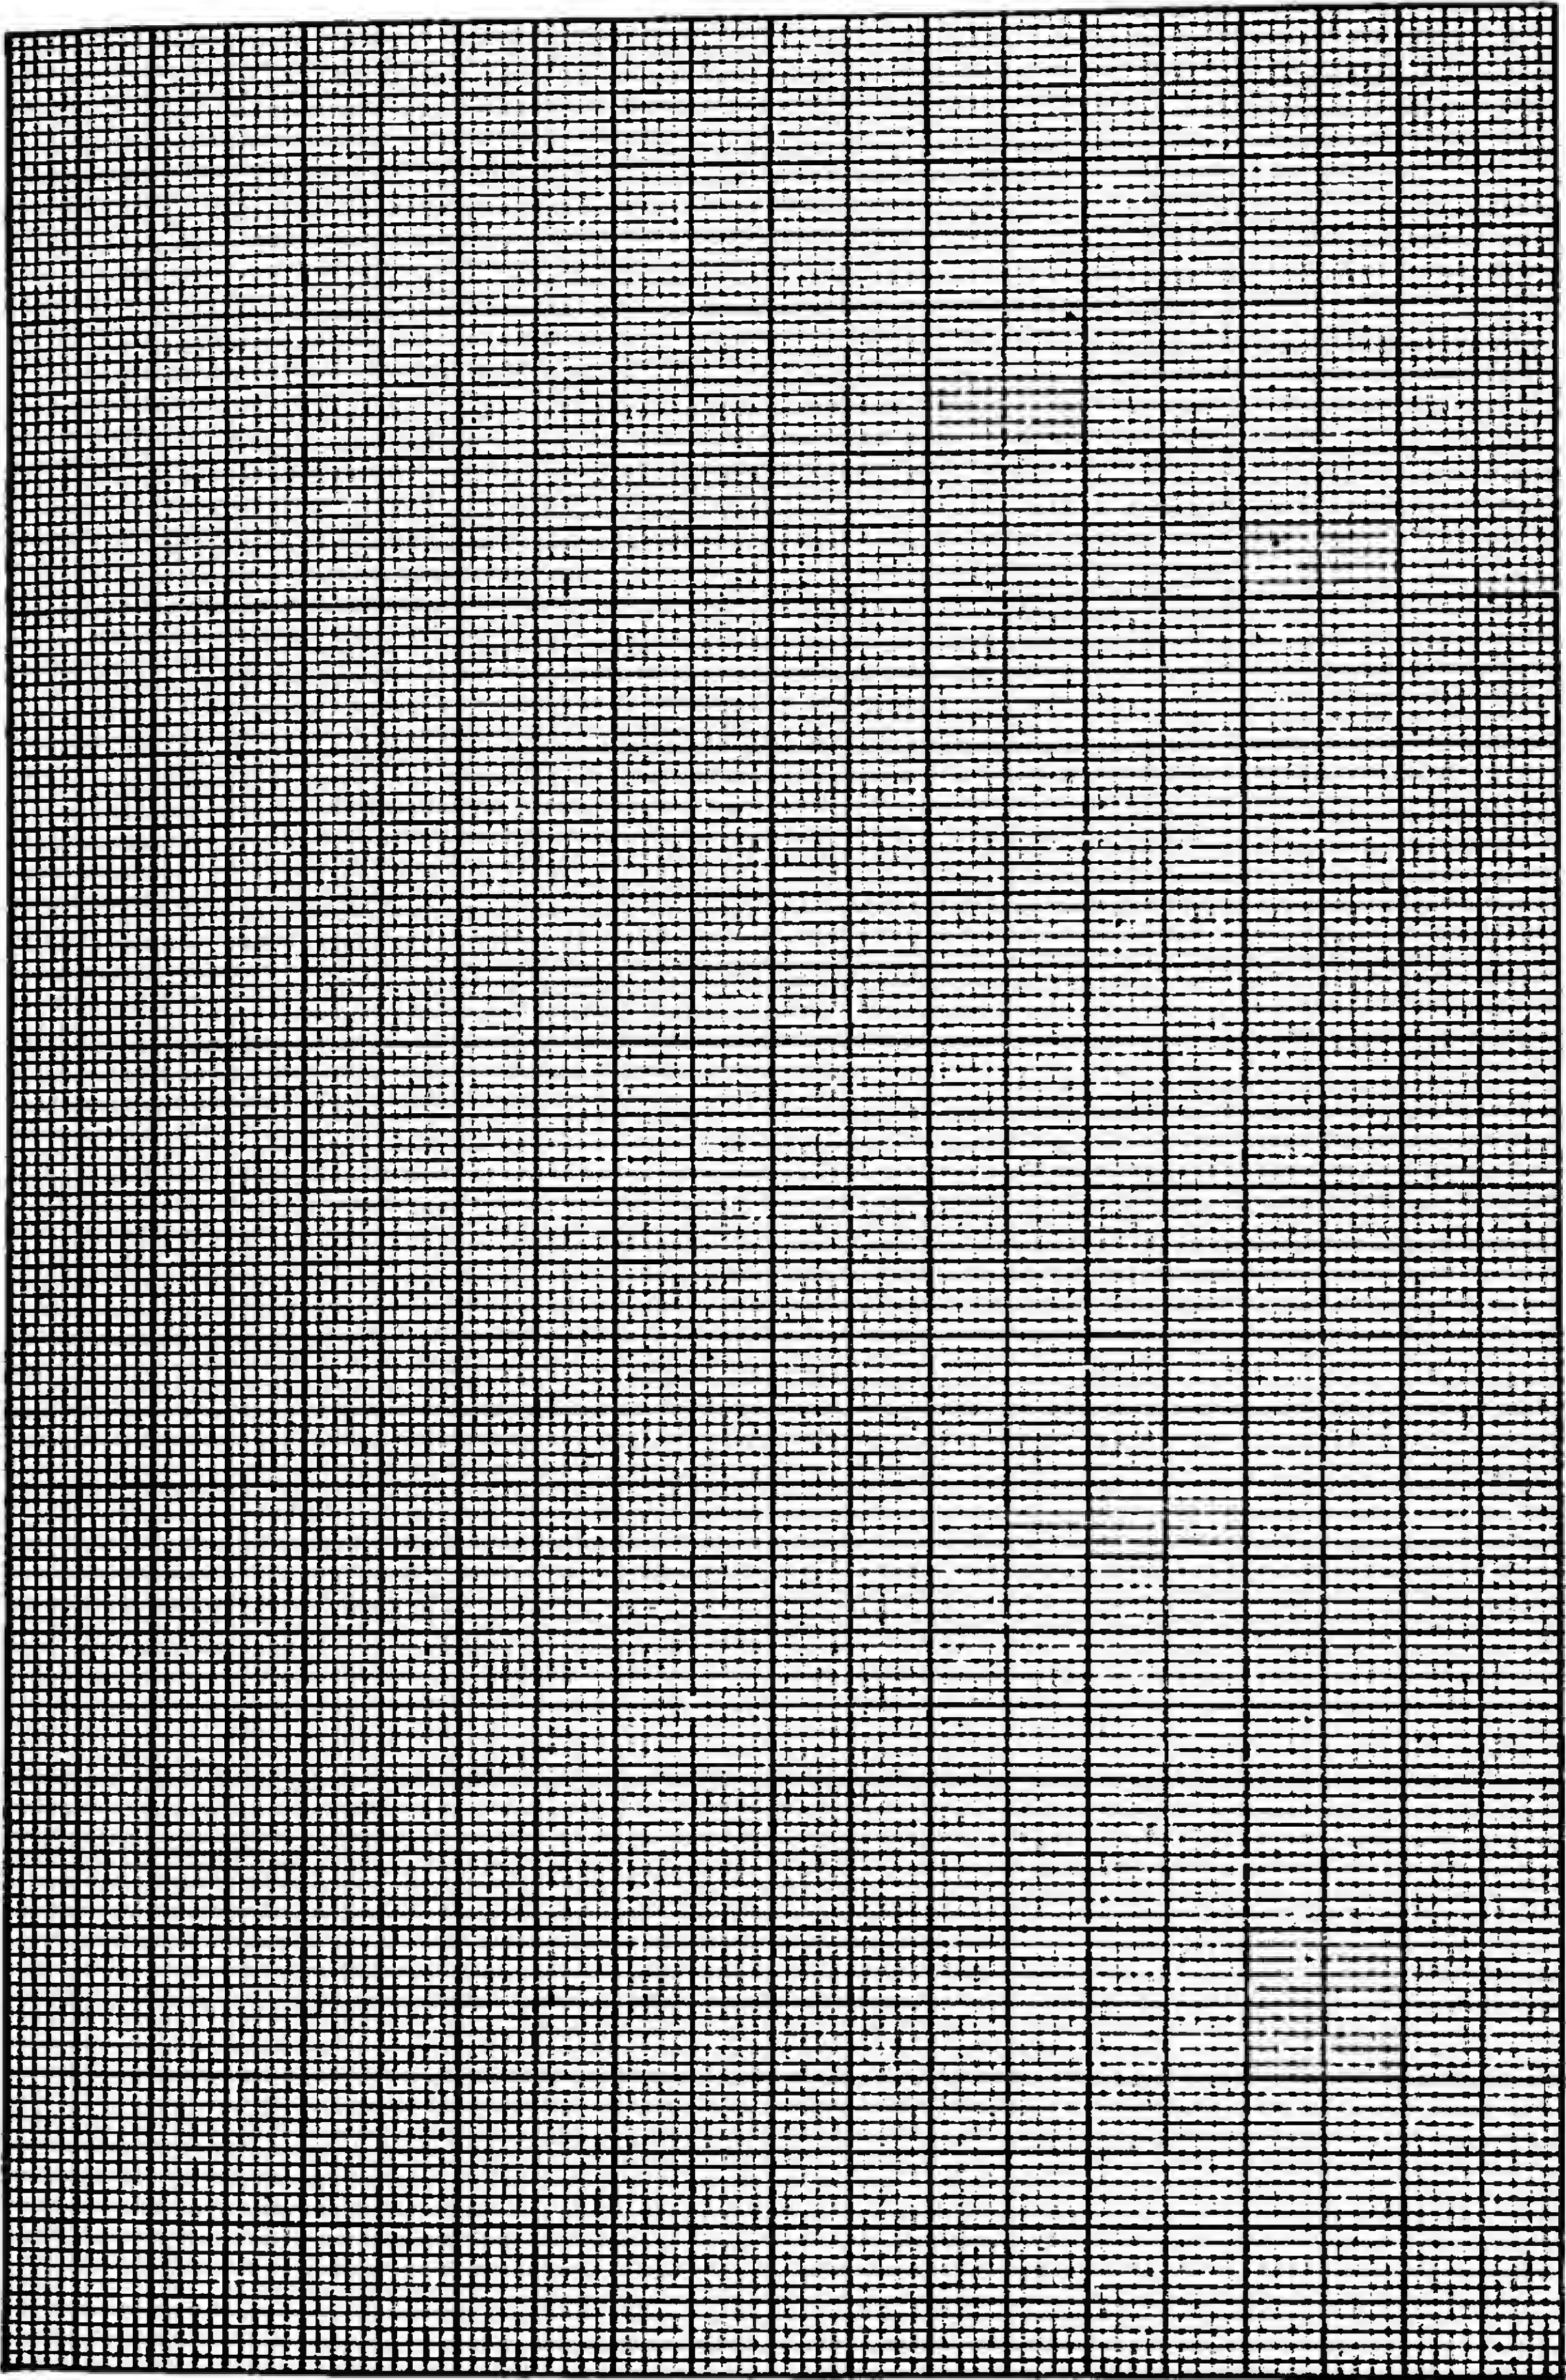

FIG. 50.—Millimeter cross-section paper.

that will help to convey a complete picture of the conditions and the results of the experiment.

**System of Polar Coordinates.**—Some data are best presented on polar coordinate paper. Common illustrations are field patterns of microphones, loud-speakers, and directional antennas.

To specify a point  $P$  by polar coordinates it is necessary to know the *distance* from the *reference point* to the point  $P$  and the *angle* this line makes with the *reference line*. In the mathematical form, as shown in Fig. 48a, the reference point corresponds to the origin used in rectangular coordinates and the reference line corresponds to the positive  $x$ -axis. To reach the point  $P$  the distance  $r$  is laid off along the  $x$ -axis and then the line is rotated counterclockwise through the positive angle  $\theta$ . The same point could be reached by rotating the line clockwise through a negative angle which would be equal to  $-(360^\circ - \theta)$ .

In commercial practice, such as navigation and directional antenna design, the reference line is north and the angles are measured clockwise. Figure 48b illustrates a commercial form of polar coordinate system. The true azimuth of the point is measured by  $\phi$  and its distance from the reference point is  $d$ . A sample of polar coordinate paper for commercial applications is shown in Fig. 49.

The point  $P$  can be represented in polar coordinates by the symbol  $(r, \theta)$  or  $(d, \phi)$  as illustrated in Fig. 48. To make it easy to locate any such point the polar coordinate paper can be printed with many radial lines along which the distance can be measured and many circles around which the angle can be measured.

#### Exercises

1. Experimental data give the following information in regard to a sample of transformer steel:

$B$	$H$	$B$	$H$
0	1.0	0	-1.0
2,000	1.3	-2,000	-1.3
4,000	1.7	-4,000	-1.7
6,000	2.2	-6,000	-2.2
8,000	3.4	-8,000	-3.4
8,300	4.0	-8,300	-4.0
8,000	2.2	-8,000	-2.2
6,000	0.0	-6,000	0.0
4,000	-0.6	-4,000	0.6
2,000	-0.8	-2,000	0.8
0	-1.0	0	1.0

Plot the  $B-H$  curve on cross-section paper, as shown in Fig. 50.

2. Field intensity measurements on a radio broadcasting station are made by going due north of the transmitter. Plot the ground wave field intensity on log-log paper<sup>1</sup> from the following data:

Miles	Millivolts per Meter	Miles	Millivolts per Meter
1	94		
1.5	61	12	5.0
2	45	14	3.9
3	28.5	16.5	3.0
4	20.5	20	2.1
5	15.5	25	1.4
6	12.5	30	1.0
8	8.6	40	0.55
10	6.4	60	0.26
		80	0.12

What is the distance to the 25, 10, 5, 2.5, and 0.5 mv per m contours? Draw the inverse distance curve through the point 100 mv per m at 1 mile.

3. The computation of field intensity measurements at 1 mile for a 1-kw broadcast transmitter using a three-tower directional antenna system results in the following data:

Azi- muth	Millivolts per Meter	Azi- muth	Millivolts per Meter	Azi- muth	Millivolts per Meter	Azi- muth	Millivolts per Meter
0	369.5	90	33.3	180	129.6	270	29.2
10	337.5	100	58.6	190	182.6	280	61.5
20	288.3	110	87.3	200	220.0	290	99.5
30	228.5	120	108.1	210	229.3	300	150.2
40	175.0	130	113.6	220	222.2	310	208.4
50	126.6	140	100.2	230	194.3	320	268.5
60	88.1	150	64.5	240	157.4	330	320.6
70	65.9	160	27.0	250	116.0	340	361.4
80	33.7	170	67.5	260	76.6	350	378.1

Plot these data on polar coordinate paper. Draw the root-mean-square field intensity circle at 191 mv per m. The area of this circle is the same as the area within the irregular pattern. This value can be checked by squaring the thirty-six readings of millivolts per meter, dividing their sum by 36, and extracting the square root. A sample of suitable polar coordinate paper is shown in Fig. 49.

<sup>1</sup>To plot such data, the Federal Communications Commission normally uses Logarithmic,  $7 \times 2.2$  cycles, No. 358-127, printed by Keuffel and Esser Co., N.Y.

## CHAPTER 9

### SIMULTANEOUS EQUATIONS

In radio and communication engineering, problems often arise in which two desired unknown quantities can be determined when two sets of conditions are known. This method of attack is very powerful and can be expanded to find an  $n$  number of desired unknowns if a set of  $n$  independent conditions are known.

**Sets of Two Linear Equations.**—The following illustration shows how a problem may lead to a set of two linear equations, sometimes called “simultaneous equations.” Let us consider the formula

$$Rk - \alpha t = 1 \quad (1)$$

where  $R$  = resistance of a metal after being heated through  $t$ .  
 $k$  = constant, the reciprocal of the resistance at the initial temperature.  
 $\alpha$  = constant, the temperature coefficient of the resistance.

$t$  = temperature change in degrees centigrade.

It is found by trial that  $R = 108$  when  $t = 20$  and that  $R = 128$  when  $t = 70$ . With these two sets of conditions, it is desired to find the constants  $k$  and  $\alpha$ . Substituting the two sets of information in Eq. (1) results in

$$108k - 20\alpha = 1 \quad (\text{using first set of conditions}) \quad (2)$$

$$128k - 70\alpha = 1 \quad (\text{using second set of conditions}) \quad (3)$$

It is easy to find numbers for  $k$  and  $\alpha$  that will satisfy Eq. (2) but not Eq. (3), and to find other numbers for  $k$  and  $\alpha$  that will satisfy Eq. (3) but not Eq. (2). There is only one pair of numbers for  $k$  and  $\alpha$  that will satisfy both equations at the same time and this pair is the solution of the set of two equations. There are three methods of finding these values of  $k$  and  $\alpha$  and these methods will be given later. The solution to this problem is

$$k = 0.01 \quad \text{Ans.}$$

$$\alpha = 0.004 \quad \text{Ans.}$$

The student can check these answers by substituting them back in Eqs. (2) and (3) and finding that both sides of the equations are equal.

This is a practical illustration, showing that the resistance of copper changes 0.4 per cent per degree centigrade.

Equations (2) and (3) represent straight lines. The one point at which they cross in a plane gives the solution. In this case  $k$  is plotted along one axis and  $\alpha$  is plotted along the other.

**Methods of Solving Simultaneous Equations.**—There are four ways of solving simultaneous equations, *the graphical method, the multiplication-addition method, the substitution method, and the determinant method.* The determinant method is the result of a systematic application of the multiplication-addition method.

**Illustration of the graphical method.**—The following set of two equations is to be solved by the graphical method:

$$x + 2y = 3 \quad (4)$$

$$x - 2y = 2 \quad (5)$$

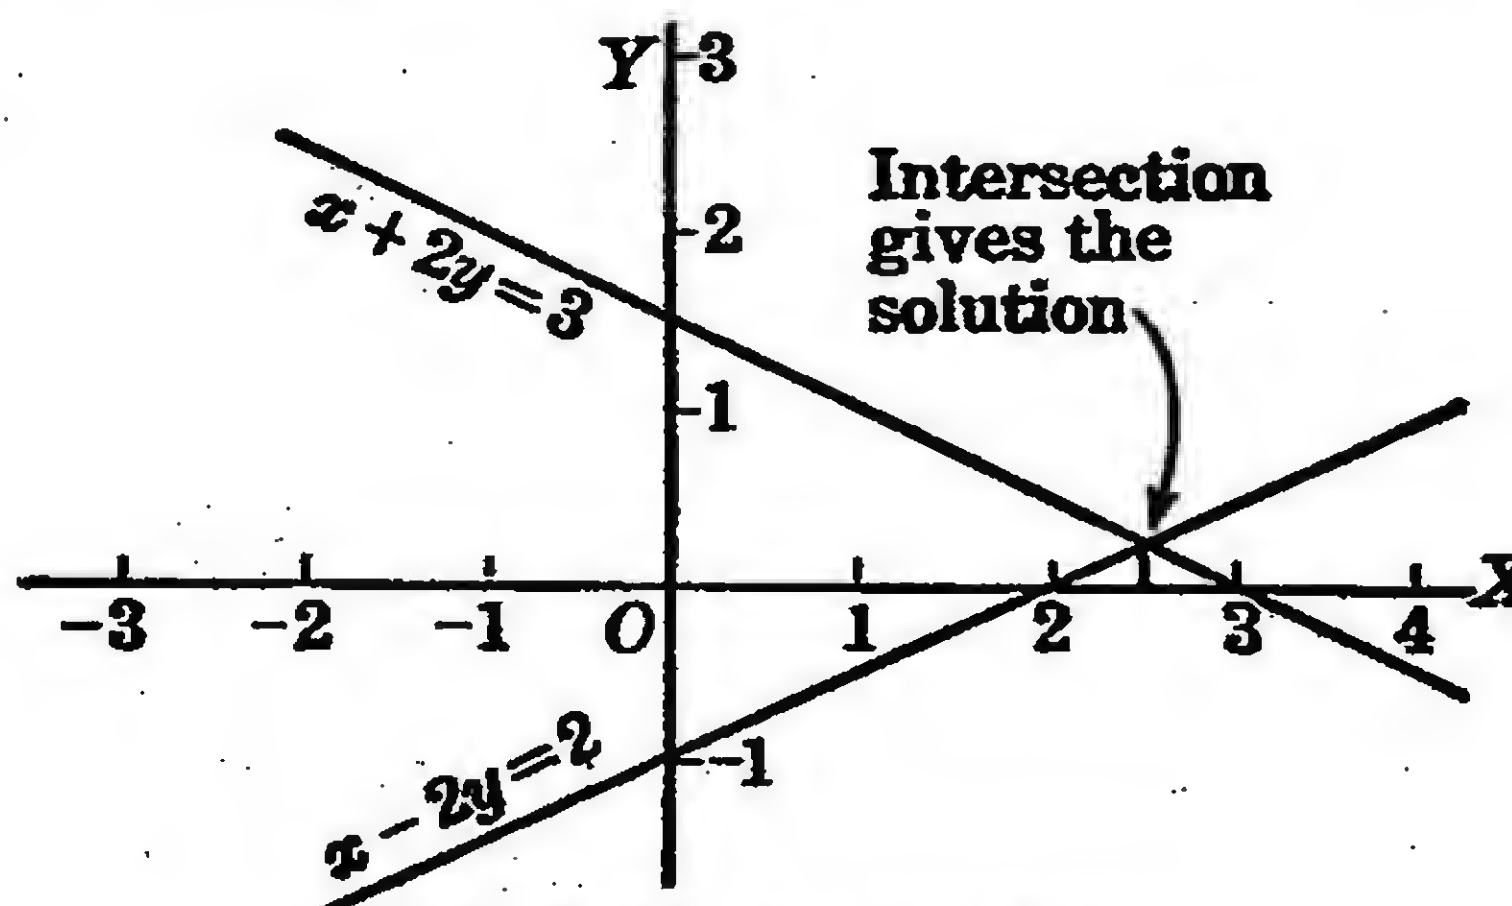

First, make a table of values for each equation as shown in Fig. 51a. When making a table of values it is convenient to solve the equation for  $y$ .

Thus  $x + 2y = 3$  is written  $y = \frac{3 - x}{2}$  (6)

and  $x - 2y = 2$  is written  $y = \frac{-2 + x}{2}$  (7)

$x + 2y = 3$		$x - 2y = 2$	
$x$	$y$	$x$	$y$
-3	3.0	-3	-2.5
-2	2.5	-2	-2.0
-1	2.0	-1	-1.5
0	1.5	0	-1.0
1	1.0	1	-0.5
2	0.5	2	0.0
3	0.0	3	0.5

(a) Table

(b) Graph of Equations

FIG. 51.—Graphical method of solving two simultaneous equations.

Second, draw on one set of axes the two graphs as shown in Fig. 51b. The two lines cross at only one point, the point where

$$x = 2.5 \quad \text{Ans.}$$

$$y = 0.25 \quad \text{Ans.}$$

This pair of numbers is the solution to the set of simultaneous equations. They give the point of intersection of the two straight lines.

In plotting a linear (straight-line) equation it is only necessary to solve the equation for two points and draw a straight line through these two points. The line can be drawn more accurately if the two points are not too close together.

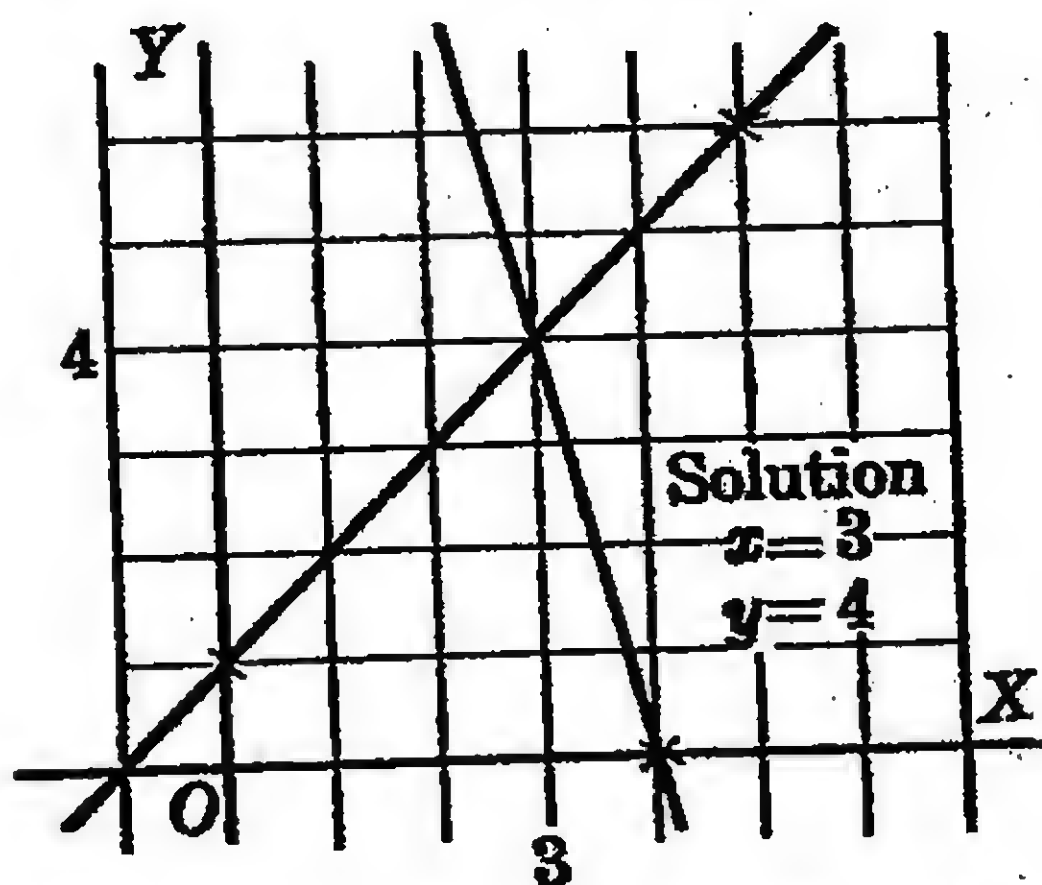

FIG. 52.—Graphical solution for Example 1.

*Example 1.* Solve the following simultaneous equations by the graphical method:

$$\begin{aligned} x - y + 1 &= 0 \\ 4x + y - 16 &= 0 \end{aligned}$$

*Solution.*

$$y = x + 1 \quad y = 16 - 4x$$

$x$	$y$	$x$	$y$
0	1	4	0
5	6	3	4

$$x = 3 \quad \text{Ans.}$$

$$y = 4 \quad \text{Ans.}$$

*Illustration of Multiplication-addition Method.*—The following set of two equations is to be solved by the multiplication-addition method:

$$5x + 3R = 14 \quad (8)$$

$$4x + 7R = 2 \quad (9)$$

First, to eliminate  $R$ , inspection of the terms  $+3R$  and  $+7R$  reveals that 21 is the L.C.M. (least common multiple) of 3 and 7. Equation (8) should be changed to contain  $+21R$  by multiplying both sides by  $+7$ . Equation (9) can be changed to contain  $-21R$  by multiplying both sides by  $-3$ . This gives

$$35x + 21R = 98 \quad (10)$$

$$-12x - 21R = -6 \quad (11)$$

Adding

$$\begin{array}{r} 35x + 21R = 98 \\ -12x - 21R = -6 \\ \hline 23x + 0 = 92 \end{array}$$

Dividing both sides by 23 gives  $x = 4$  Ans.

Second, in order to determine  $R$ , substitute the answer 4 for  $x$  in Eq. (8), giving

$$20 + 3R = 14$$

Adding  $-20$  to both sides

gives

$$3R = -6$$

Dividing both sides by 3

gives

$$R = -2 \quad \text{Ans.}$$

*Check:* Substitute 4 for  $x$  and  $-2$  for  $R$  in both Eqs. (8) and (9), thus

$$\begin{array}{rcl} 5x + 3R & = & 14 \\ 20 - 6 & = & 14 \\ 14 & = & 14 \end{array} \qquad \begin{array}{rcl} 4x + 7R & = & 2 \\ 16 - 14 & = & 2 \\ 2 & = & 2 \end{array}$$

Hence, the solution  $x = 4$  and  $R = -2$  has just been proved correct.

*Example 2.* Solve the following simultaneous equations by the multiplication-addition method:

$$\begin{array}{rcl} 5x + 7y & = & 3 \\ 3x + 14y & = & 6 \end{array}$$

Multiplying the first equation by  $-2$  and adding the second gives

$$\begin{array}{rcl} -10x - 14y & = & -6 \\ 3x + 14y & = & 6 \\ \hline -7x & = & 0 \\ x & = & 0 \quad \text{Ans.} \end{array}$$

gives

Hence,

Substituting  $x = 0$  in the first equation,  $y = \frac{3}{7}$  Ans.

*Illustration of the Substitution Method.*—The following set of two equations is to be solved by the substitution method:

$$4x + 3R = 5 \tag{12}$$

$$6x - 7R = 19 \tag{13}$$

First, solve Eq. (12) for  $R$ , obtaining

$$R = \frac{5 - 4x}{3} \tag{14}$$

Second, copy Eq. (13) but in the place of  $R$  write the fraction as given in Eq. (14). This is permissible because  $R$  is equal to this fraction. The result of this substitution is then

$$6x - \frac{7(5 - 4x)}{3} = 19 \tag{15}$$

This equation contains only one unknown number,  $x$ . The unknown number  $R$  has been eliminated by substitution. Multiply both sides of the equation by 3, giving

$$18x - 7(5 - 4x) = 57$$

Removing the parentheses

gives  $18x - 35 + 28x = 57$

Collecting terms,  $46x = 92$

Hence,  $x = 2$  Ans.

Third, substitute 2 for  $x$  in Eq. (14), giving

$$R = \frac{5 - 4x}{3} = \frac{5 - 8}{3} = -1 \text{ Ans.}$$

*Check:* Substitute  $x = 2$  and  $R = -1$  in Eqs. (12) and (13), thus

$$\begin{array}{rcl} 4x + 3R = 5 & 6x - 7R = 19 \\ 8 - 3 = 5 & 12 + 7 = 19 \\ 5 = 5 & 19 = 19 \end{array}$$

Hence,  $x = 2$  and  $R = -1$  is the one and only solution to this set of simultaneous equations.

The substitution method, just shown, can be used in more difficult situations than the multiplication-addition method. This can be illustrated by noting the following pair of equations:

$$3x + 2R = 4 \tag{16}$$

$$x^2 + R^2 = 5 \tag{17}$$

Equation (16) is a linear equation (of the first degree, since  $x$  and  $R$  appear to the first power). Equation (17) is a quadratic equation (of the second degree, since  $x$  and  $R$  appear to the second power).

First, solve Eq. (16) for  $R$ , obtaining

$$R = \frac{4 - 3x}{2} \tag{18}$$

Second, substitute this value of  $R$  in Eq. (17) to obtain

$$x^2 + \left(\frac{4 - 3x}{2}\right)^2 = 5 \quad \text{or} \quad x^2 + \frac{16 - 24x + 9x^2}{4} = 5$$

Multiplying both sides by 4,

$$4x^2 + 16 - 24x + 9x^2 = 20 \tag{19}$$

Collecting terms,  $13x^2 - 24x - 4 = 0$

This is an equation in  $x$  only and can be solved for  $x$  very easily by the methods of the next chapter. The above set of

simultaneous equations could not be solved by the multiplication-addition method.

*Example 3.* Solve by the substitution method the following problem:

The sum of the three angles of a triangle is  $180^\circ$ . If one acute angle of the right triangle is four times the size of the other, determine the size of the two acute angles.

*Solution.* From the first statement let  $\alpha$  and  $\beta$  be the two acute angles to get

$$\alpha + \beta + 90^\circ = 180^\circ$$

or

$$\alpha + \beta = 90^\circ$$

From the second statement,

$$\alpha = 4\beta$$

Substituting this value of  $\alpha$  in the first equation gives

$$4\beta + \beta = 90$$

$$\beta = 18^\circ \quad \text{Ans.}$$

and

$$\alpha = 4\beta = 4(18)^\circ = 72^\circ \quad \text{Ans.}$$

**Classification of Linear Simultaneous Equations.**—Some sets of equations have no solution. To illustrate, the equations

$$2x + 3R = 5$$

$$2x + 3R = 7$$

contradict each other, and are *inconsistent*. The graphical method shows that they are parallel lines and hence do not meet to give a solution.

Some sets of equations are *dependent*, because one equation can be made exactly like the other by multiplying by some number. To illustrate, the first equation of the set,

$$3x + 6R = 7.5$$

$$2x + 4R = 5$$

becomes the second when it is multiplied by  $\frac{2}{3}$ . The graphical method shows that both equations represent the same straight line, hence they have an infinite number of solutions. Such equations are sometimes called “indeterminate equations.”

All sets of equations that are neither *inconsistent* nor *dependent* are called “*independent*.” Their graphs are distinct nonparallel lines and they always have a single solution. That is, they cross at only one point. If the equations are written in general form, we have

$$a_1x + b_1y = c_1 \quad (20)$$

$$a_2x + b_2y = c_2 \quad (21)$$

where  $a_1, b_1, c_1, a_2, b_2$ , and  $c_2$  are any numbers. It can be shown that the equations are independent if

$$a_1b_2 - a_2b_1 \neq 0 \quad (22)$$

and either dependent or inconsistent if  $a_1b_2 - a_2b_1 = 0$  (23)

*Illustration of Independent.*—Consider the simultaneous equations

$$2x + 4y = 10 \quad (24)$$

$$5x - y = 8 \quad (25)$$

From the notation of Eqs. (20) and (21), the quantity

$$a_1b_2 - a_2b_1,$$

for example, can be written

$$(2)(-1) - (5)(4) \neq 0 \quad \text{or} \quad -2 - 20 \neq 0$$

Hence the equations are independent and have only one solution.

*Illustration of Dependent.*—Consider the simultaneous equations

$$2x + 4y = 10 \quad (26)$$

$$5x + 10y = 25 \quad (27)$$

From the above notation,  $a_1b_2 - a_2b_1$  for this illustration is

$$(2)(10) - (5)(4) = 0 \quad \text{or} \quad 20 - 20 = 0$$

Hence the equations are either dependent or inconsistent. In this case we see that they are dependent because, if Eq. (26) is multiplied by 2.5, Eq. (27) results.

*Illustration of Inconsistent.*—Consider the simultaneous equations

$$2x + 18y = 9 \quad (28)$$

$$x + 9y = 10 \quad (29)$$

From the above notation,  $a_1b_2 - a_2b_1$  for this illustration is

$$(2)(9) - (1)(18) = 0 \quad \text{or} \quad 18 - 18 = 0$$

showing that the equations are either dependent or inconsistent. In this case multiplying Eq. (29) by 2 gives  $2x + 18y = 20$  which does not check with the right-hand side of Eq. (28); hence the equations are inconsistent.

**Second-order Determinants.**—From the multiplication-addition method, a handy tool known as a “determinant” can be developed.

Two simultaneous equations can be written in general form, as follows:

$$a_1x + b_1y = c_1 \quad (20)$$

$$a_2x + b_2y = c_2 \quad (21)$$

To develop this new tool multiply the general Eq. (20) by  $b_2$  and Eq. (21) by  $-b_1$  giving

$$a_1b_2x + b_1b_2y = c_1b_2 \quad (30)$$

$$\text{and} \quad -a_2b_1x - b_1b_2y = -c_2b_1 \quad (31)$$

$$\text{Adding,} \quad \frac{-a_2b_1x - b_1b_2y}{(a_1b_2 - a_2b_1)x} = \frac{c_1b_2 - b_1c_2}{b_2c_1 - b_1c_2}$$

$$\text{or} \quad x = \frac{b_2c_1 - b_1c_2}{a_1b_2 - a_2b_1} \quad (32)$$

Similarly, multiply Eq. (20) by  $-a_2$  and Eq. (21) by  $a_1$  giving

$$-a_1a_2x - a_2b_1y = -a_2c_1 \quad (33)$$

$$\text{and} \quad a_1a_2x + a_1b_2y = a_1c_2 \quad (34)$$

$$\text{Adding,} \quad \frac{a_1a_2x + a_1b_2y}{(a_1b_2 - a_2b_1)y} = \frac{a_1c_2 - a_2c_1}{b_2c_1 - b_1c_2}$$

$$\text{or} \quad y = \frac{a_1c_2 - a_2c_1}{a_1b_2 - a_2b_1} \quad (35)$$

Equations (32) and (35) are the desired equations which will give the solution of the general Eqs. (20) and (21).

It is more convenient to write these solutions by the notation of determinants, as follows:

$$x = \frac{\begin{vmatrix} c_1 & b_1 \\ c_2 & b_2 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}} \quad (36)$$

$$y = \frac{\begin{vmatrix} a_1 & c_1 \\ a_2 & c_2 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}} \quad (37)$$

$$\text{The term } \begin{vmatrix} c_1 & b_1 \\ c_2 & b_2 \end{vmatrix}$$

is called a *determinant* and is equal to  $c_1b_2 - b_1c_2$ . In other words, from the product of the two *elements*  $c_1b_2$  in the *principal diagonal* the product of the elements  $b_1c_2$  in the other diagonal is subtracted. This is the numerator in the fraction of Eq. (32) expressed in plain algebra and also the numerator of Eq. (36) expressed in determinant notation.

*Illustration of Determinants.*—The following two equations are to be solved by the method of determinants:

$$2x + 3y = 6 \quad (38)$$

$$3x - 8y = 24 \quad (39)$$

Substituting in Eq. (36) for  $x$  gives

$$x = \frac{\begin{vmatrix} 6 & 3 \\ 24 & -8 \\ 2 & 3 \\ 3 & -8 \end{vmatrix}}{\begin{vmatrix} 2 & 3 \\ 3 & -8 \end{vmatrix}} = \frac{(6)(-8) - (3)(24)}{(2)(-8) - (3)(3)} = \frac{-48 - 72}{-16 - 9} = \frac{120}{25} = 4.8 \text{ Ans.}$$

Substituting in Eq. (37) for  $y$  gives

$$y = \frac{\begin{vmatrix} 2 & 6 \\ 3 & 24 \\ 2 & 3 \\ 3 & -8 \end{vmatrix}}{\begin{vmatrix} 2 & 3 \\ 3 & -8 \end{vmatrix}} = \frac{(2)(24) - (6)(3)}{(2)(-8) - (3)(3)} = \frac{48 - 18}{-16 - 9} = \frac{30}{-25} = -1.2 \text{ Ans.}$$

The student should substitute these values in the original equation to check that they are correct.

*Example 4.* Solve by determinants

$$\begin{aligned} 2x - y &= 1 \\ x + 3y &= 11 \end{aligned}$$

*Solution.*

$$\text{By Eq. (36)} \quad x = \frac{\begin{vmatrix} 1 & -1 \\ 11 & 3 \\ 2 & -1 \\ 1 & 3 \end{vmatrix}}{\begin{vmatrix} 2 & -1 \\ 1 & 3 \end{vmatrix}} = \frac{3 + 11}{6 + 1} = \frac{14}{7} = 2 \text{ Ans.}$$

$$\text{By Eq. (37)} \quad y = \frac{\begin{vmatrix} 2 & 1 \\ 1 & 11 \\ 2 & -1 \\ 1 & 3 \end{vmatrix}}{\begin{vmatrix} 2 & -1 \\ 1 & 3 \end{vmatrix}} = \frac{22 - 1}{6 + 1} = \frac{21}{7} = 3 \text{ Ans.}$$

**Sets of Three Linear Equations.**—With three linear equations it is possible to solve for three unknowns, provided the equations are independent.

One linear equation constitutes a line (one dimension). Two linear equations define a surface (two dimensions). Three linear equations define a solid (three dimensions). The graphical method is not so useful with three linear equations since it is normally only two dimensional; hence it will not be treated here.

The multiplication-addition method and the substitution method will be treated by means of examples.

*Illustration of Multiplication-addition Method.*—The following set of three equations is to be solved for  $x$ ,  $y$ , and  $z$ :

$$2x - 3y - z = -4 \quad (40)$$

$$3x + y + 2z = 7 \quad (41)$$

$$4x - 2y + 3z = -1 \quad (42)$$

The plan is to eliminate  $x$  from the first two equations and then from the last two equations of the above set. This will result in a new set of two equations in two unknowns, namely  $y$  and  $z$ . This set can then be solved by any of the methods just explained.

Proceeding with the solution,

$$\text{Multiply Eq. (40) by } -3 \quad -6x + 9y + 3z = 12 \quad (43)$$

$$\text{and multiply Eq. (41) by } 2 \quad 6x + 2y + 4z = 14 \quad (44)$$

$$\text{Adding,} \quad 11y + 7z = 26 \quad (45)$$

$$\text{Now multiply Eq. (41) by } 4 \quad 12x + 4y + 8z = 28 \quad (46)$$

$$\text{and multiply Eq. (42) by } -3 \quad -12x + 6y - 9z = 3 \quad (47)$$

$$\text{Adding,} \quad 10y - z = 31 \quad (48)$$

The new set of Eqs. (45) and (48) when solved give

$$y = 3 \quad \text{Ans.}$$

$$z = -1 \quad \text{Ans.}$$

Substituting these values in Eq. (40) shows that

$$x = 2 \quad \text{Ans.}$$

The check consists of substituting these values in all three of the original Eqs. (40), (41), and (42) to see if they are true. This is left to the student.

There are many possible ways of using this method. In the above example, what multipliers should be used to eliminate  $y$  from Eqs. (40) and (41); and from Eqs. (41) and (42)? What multipliers should be used to eliminate  $z$  from Eqs. (40) and (41); and from Eqs. (41) and (42)?

*Illustration of Substitution Method.*—The following set of three equations is to be solved for  $x$ ,  $y$ , and  $z$ :

$$3x + 2y - 4z = 3 \quad (49)$$

$$2x + y + 3z = 8 \quad (50)$$

$$5x + 3y + 2z = 14 \quad (51)$$

The method is to solve for one of the numbers  $x$ ,  $y$ , or  $z$  in one of the equations, substitute its value in the other two equations, and then solve the resulting set of two equations.

For illustration, solve Eq. (50) for  $y$ , since its coefficient is unity.

$$y = 8 - 2x - 3z \quad (52)$$

Substituting this value of  $y$  in Eqs. (49) and (51) and simplifying gives

$$3x + 2(8 - 2x - 3z) - 4z = 3 \text{ or } x + 10z = 13 \quad (53)$$

$$5x + 3(8 - 2x - 3z) + 2z = 14 \text{ or } x + 7z = 10 \quad (54)$$

Solving Eqs. (53) and (54) yields

$$x = 3 \quad \text{Ans.}$$

$$z = 1 \quad \text{Ans.}$$

Substituting these values of  $x$  and  $z$  in Eq. (52) results in

$$y = 8 - 6 - 3 = -1 \quad \text{Ans.}$$

The student can now check these answers by substitution in the original Eqs. (49), (50), and (51) to verify the work.

**Third-order Determinants.**—In a manner similar to the development of second-order determinants, it is possible to set up determinants for the solution of three simultaneous equations.

The three simultaneous equations can be written in general form, as follows:

$$a_1x + b_1y + c_1z = d_1 \quad (55)$$

$$a_2x + b_2y + c_2z = d_2 \quad (56)$$

$$a_3x + b_3y + c_3z = d_3 \quad (57)$$

The solution of these equations is given by the following determinants and the corresponding algebraic equations:

$$x = \frac{\begin{vmatrix} d_1 & b_1 & c_1 \\ d_2 & b_2 & c_2 \\ d_3 & b_3 & c_3 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}} = \frac{\begin{matrix} d_1b_2c_3 + b_1c_2d_3 + c_1d_2b_3 \\ -d_1c_2b_3 - b_1d_2c_3 - c_1b_2d_3 \end{matrix}}{\begin{matrix} a_1b_2c_3 + b_1c_2a_3 + c_1a_2b_3 \\ -a_1c_2b_3 - b_1a_2c_3 - c_1b_2a_3 \end{matrix}} \quad (58)$$

$$y = \frac{\begin{vmatrix} a_1 & d_1 & c_1 \\ a_2 & d_2 & c_2 \\ a_3 & d_3 & c_3 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}} = \frac{\begin{matrix} a_1d_2c_3 + d_1c_2a_3 + c_1a_2d_3 \\ -a_1c_2d_3 - d_1a_2c_3 - c_1d_2a_3 \end{matrix}}{\begin{matrix} a_1b_2c_3 + b_1c_2a_3 + c_1a_2b_3 \\ -a_1c_2b_3 - b_1a_2c_3 - c_1b_2a_3 \end{matrix}} \quad (59)$$

$$z = \frac{\begin{vmatrix} a_1 & b_1 & d_1 \\ a_2 & b_2 & d_2 \\ a_3 & b_3 & d_3 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}} = \frac{\begin{matrix} a_1b_2d_3 + b_1d_2a_3 + d_1a_2b_3 \\ -a_1d_2b_3 - b_1a_2d_3 - d_1b_2a_3 \end{matrix}}{\begin{matrix} a_1b_2c_3 + b_1c_2a_3 + c_1a_2b_3 \\ -a_1c_2b_3 - b_1a_2c_3 - c_1b_2a_3 \end{matrix}} \quad (60)$$

The positive terms are obtained from the product of the three elements in the diagonals running down from left to right and the negative terms are obtained from the product of the three elements in the diagonals running down from right to left.

It will be noted that the denominators are the same in each case, being the coefficients of  $x$ ,  $y$ , and  $z$  of the original Eqs. (55), (56), and (57). The numerators can be obtained from the denominators by replacing the coefficients of the unknowns in question by the known terms  $d_1$ ,  $d_2$ , and  $d_3$ .

*Illustrations of Determinants.*—The following set of three equations is to be solved by the method of determinants:

$$x - y - z = -6 \quad (61)$$

$$2x + y + z = 0 \quad (62)$$

$$3x - 5y + 8 = 13 \quad (63)$$

Substituting the coefficients in Eq. (58) gives  $x$ .

$$x = \frac{\begin{vmatrix} -6 & -1 & -1 \\ 0 & 1 & 1 \\ 13 & -5 & 8 \end{vmatrix}}{\begin{vmatrix} 1 & -1 & -1 \\ 2 & 1 & 1 \\ 3 & -5 & 8 \end{vmatrix}} = \frac{-78}{39} = -2 \quad \text{Ans.}$$

Substituting the coefficients in Eq. 59 gives  $y$ .

$$y = \frac{\begin{vmatrix} 1 & -6 & -1 \\ 2 & 0 & 1 \\ 3 & 13 & 8 \end{vmatrix}}{\begin{vmatrix} 1 & -1 & -1 \\ 2 & 1 & 1 \\ 3 & -5 & 8 \end{vmatrix}} = \frac{39}{39} = 1 \quad \text{Ans.}$$

Substituting the coefficients in Eq. 60 gives  $z$ .

$$z = \frac{\begin{vmatrix} 1 & -1 & -6 \\ 2 & 1 & 0 \\ 3 & -5 & 13 \end{vmatrix}}{\begin{vmatrix} 1 & -1 & -1 \\ 2 & 1 & 1 \\ 3 & -5 & 8 \end{vmatrix}} = \frac{117}{39} = 3 \quad \text{Ans.}$$

The student can verify these answers by substituting them back in the original Eqs. (61), (62), and (63).

After a little experience with using determinants, the tool becomes well polished and easy to operate in solving otherwise rather tedious problems.

*Example 5.* Solve by determinants,

$$\begin{aligned} 2x + 3y + z &= 4 \\ x + 2y + 2z &= 6 \\ 5x + y + 4z &= 21 \end{aligned}$$

*Solution.*

$$\text{By Eq. (58), } x = \frac{\begin{vmatrix} 4 & 3 & 1 \\ 6 & 2 & 2 \\ 21 & 1 & 4 \end{vmatrix}}{\begin{vmatrix} 2 & 3 & 1 \\ 1 & 2 & 2 \\ 5 & 1 & 4 \end{vmatrix}} = \frac{32 + 126 + 6 - 42 - 8 - 72}{16 + 30 + 1 - 10 - 4 - 12} = \frac{42}{21} = 2 \quad \text{Ans.}$$

$$\text{By Eq. (59), } y = \frac{\begin{vmatrix} 2 & 4 & 1 \\ 1 & 6 & 2 \\ 5 & 21 & 4 \end{vmatrix}}{\begin{vmatrix} 2 & 3 & 1 \\ 1 & 2 & 2 \\ 5 & 1 & 4 \end{vmatrix}} = \frac{48 + 40 + 21 - 30 - 84 - 16}{16 + 30 + 1 - 10 - 4 - 12} = -\frac{21}{21} = -1 \quad \text{Ans.}$$

$$\text{By Eq. (60), } z = \frac{\begin{vmatrix} 2 & 3 & 4 \\ 1 & 2 & 6 \\ 5 & 1 & 21 \end{vmatrix}}{\begin{vmatrix} 2 & 3 & 1 \\ 1 & 2 & 2 \\ 5 & 1 & 4 \end{vmatrix}} = \frac{84 + 90 + 4 - 40 - 12 - 63}{16 + 30 + 1 - 10 - 4 - 12} = \frac{63}{21} = 3 \quad \text{Ans.}$$

**Any Number of Linear Equations.**—From the discussion of sets of two and three equations, it becomes apparent that the number of independent equations is the same as that of unknown numbers. The multiplication-addition and substitution meth-

ods, or a combination of the two, can be applied to any number of equations. One equation is necessarily used in eliminating each unknown number until there remains only one equation in one unknown, which can be solved for that unknown. If one equation of the set can be changed into the exact form of another equation of the set, then they are dependent. If two of the equations of the set contradict each other, then the set is inconsistent.

Determinants are especially convenient in solving simultaneous equations of the higher order. The procedure is to set down the general form of the set of equations, then form the denominator by setting up the array of coefficients of the unknowns. The numerators can be made from the denominators by replacing the coefficients of the unknown with the known terms. The diagonals running down from left to right are positive and those running down from right to left are negative. Furthermore, the theory of minors must be used to secure all the terms. For illustration a fourth order determinant will contain 24 terms. In the fourth order determinant,

$$\begin{vmatrix} a_1 & b_1 & c_1 & d_1 \\ a_2 & b_2 & c_2 & d_2 \\ a_3 & b_3 & c_3 & d_3 \\ a_4 & b_4 & c_4 & d_4 \end{vmatrix}$$

the term  $a_1$  must be multiplied by its minor which is the determinant remaining when the row and column containing  $a_1$  is removed. This gives 6 terms. Performing this operation for the terms  $b_1$ ,  $c_1$ , and  $d_1$  results in 18 more terms to make the total of 24 terms.

**Summary.**—First let us define some of the terms used in this chapter.

1. A *linear equation* is a statement of equality with the unknowns only of the first degree. In other words, it states that everything on the left side of the equal sign is exactly equal to everything on the right side of the equal sign, and if there are two unknowns (such as  $x$  and  $y$ ), they are only of the first power, not squared (such as  $x^2$  or  $y^2$ ) or multiplied by each other (such as  $xy$ ).

2. *Simultaneous equations* are statements of equality that are true at the same time and have a common solution.

3. *Independent equations* are statements of equality that are all different, but have a single common solution.

4. *Dependent equations* are statements of equality that are alike and therefore have an infinite number of solutions.

5. *Inconsistent equations* are statements of equality that cannot both be true at the same time, and therefore do not have a common solution.

Now, with these five definitions clearly in mind, you can see what the problems at the end of this chapter are like. For example, suppose you have two equations that are not alike and do not disagree. Then they fit definitions 1, 2, and 3 above and are called "independent linear simultaneous equations." If both of them have  $x$  and  $y$  and there are no other unknowns, then the two equations can be solved for  $x$  and  $y$ . You will be able to find one and only one value of  $x$  and one and only one value of  $y$  that will make both equations true at the same time.

If the equations are dependent you will find that any set of values for  $x$  and  $y$  that suit one equation will also suit the other equation. This means that you really have only one equation and not two.

But if the equations are inconsistent you cannot find one set of values for  $x$  and  $y$  that will suit both equations at the same time. Hence you do not have a problem that you can solve.

Many students have trouble trying to solve dependent and inconsistent sets of equations. The fact is that they are not to be solved. The student must understand this or he will be held back in his later work. The only kind of simultaneous equations that can be solved are independent ones. The exercises of this chapter are made to help you pick out the independent sets of equations from the dependent and inconsistent ones.

Students and teachers are often called upon to solve practical problems. In doing so they might be required to set up a set of simultaneous equations. As an illustration, the currents of a network can be found if the voltages and impedances are known. What is to be done if the equations made up turn out to be dependent or inconsistent? If they are dependent, it means that the student has not obtained enough independent equations. Hence he will have to set up more equations until he has as many independent equations as he has currents (or unknowns)

to be determined. If the equations are inconsistent, it means that he has taken some wrong steps. Therefore, he must go back and correct the equations that he set up wrongly.

Now that it is clear that you must have independent simultaneous equations before you can solve them properly, you will see that this chapter tells you how to solve for them in four different ways. Sometimes one way is better than another. Therefore, you should become acquainted with all of the methods of solving simultaneous equations.

1. The *graphic method* is used only with two equations involving only two unknowns, but it is very useful in helping to understand the meaning of independence, dependence, and inconsistency. Try it on each kind of problem and see for yourself.

2. The *multiplication-addition method* is not very often used except for the more simple problems. Sometimes, however, you will find that it will save you time, and you should practice it until you know how it works.

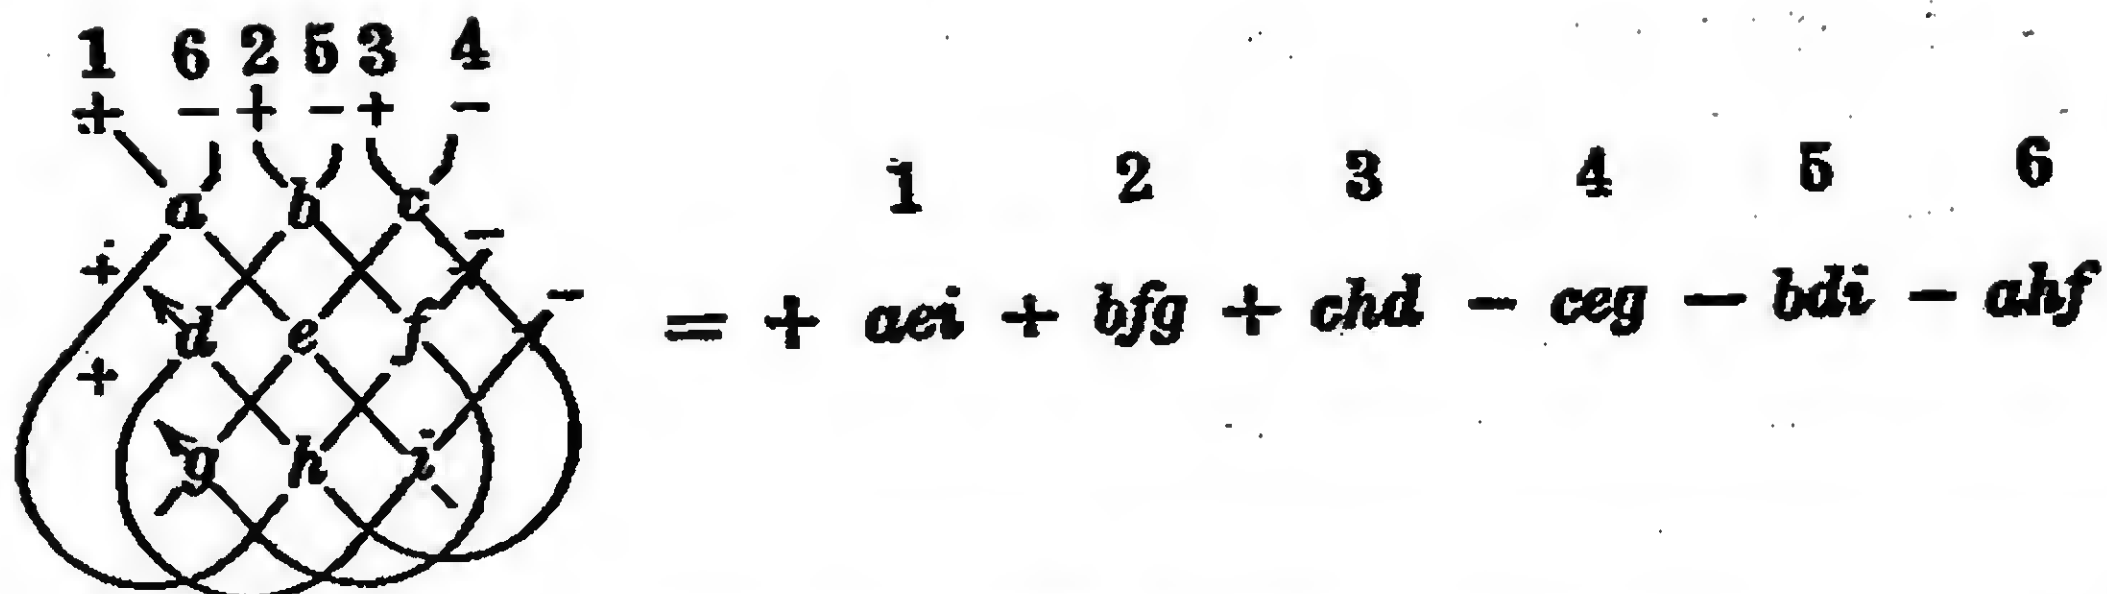

3. The *substitution method* is more useful because it can be used in all problems of simultaneous equations. Therefore you must become thoroughly acquainted with it.

4. The *method of determinants* is quite fully explained in this chapter. There are no tricks intentionally not told to you, but the more you use this method the more you will see that it is a very practical method to use in solving sets of equations. It is very important that you get the equations in the standard form before you start to apply this method. Then the expansion of the determinants by diagonals must be thoroughly understood. The following illustration should make this clear for you.

Rewrite the first two columns on the right-hand side of the determinant and draw diagonals as indicated, the product of the terms in the right-hand diagonals being positive and those in the left-hand diagonals negative.

$$\begin{array}{cccccc}
 1 & 2 & 3 & 4 & 5 & 6 \\
 + & + & + & - & - & - \\
 \begin{array}{c} a \\ d \\ g \end{array} & \begin{array}{c} b \\ e \\ h \end{array} & \begin{array}{c} c \\ f \\ i \end{array} & \begin{array}{c} a' \\ d' \\ g' \end{array} & \begin{array}{c} b' \\ e' \\ h' \end{array} & \\
 \end{array} = + \begin{array}{cccccc}
 1 & 2 & 3 & 4 & 5 & 6 \\
 aei & bfg & cdh & -ceg & -afh & -bdi
 \end{array}$$

Instead of rewriting the columns the arrows can be curved around to get the same terms, as follows.

The arrows show you how to write down the plus and minus signs as the chapter explains. The method of determinants avoids much of the algebraic work that is required in the other methods. Learn to use it.

### Exercises

Inspect the following sets of equations for dependence or inconsistency and solve the independent sets:

1.  $x + 3y = 7.$   
 $4x + 12y = 28.$

2.  $x + 2y = 13.$   
 $2x - y = 1.$

3.  $3x + y = 10.$   
 $9x + 3y = 13.$

4.  $3R_1 + R_2 - 2R_3 = 5.$   
 $12R_1 + 4R_2 - 8R_3 = 20.$

5.  $IR + 2E - IZ = 21.$   
 $2Z - 2\frac{E}{I} - 8R = 16.$   
 $3IR + IZ - E = 7.$

6.  $2x + 3y + z = 17.$   
 $x + y + 2z = 23.$

$14x + 5y - 3z = 3.$

7.  $\frac{7}{x} - \frac{5}{y} = -9.$

$\frac{2}{x} + \frac{4}{y} = 11.$

8.  $ax + by = 2ab.$   
 $bx + ay = a^2 + b^2.$

9.  $1.2x - 1.7y = 8.$   
 $0.4x + 1.1y = 5.$

10.  $10 = 0.5R_1 + 0.25R_2.$   
 $20 = 10R_1 - 4R_2.$

The student should use all the methods outlined in order to become familiar with them.

## CHAPTER 10

### QUADRATIC EQUATIONS

Many problems arise in engineering which can be worked by an equation containing the unknown quantity squared. *The quadratic equation is an equation which contains the unknown quantity to the second power.* The values of the unknown quantity which will satisfy this equation are called “roots of the equation.” There are in general two roots that will satisfy the equation.

The simplest type of quadratic equation is called a “pure quadratic.” In the pure quadratic equation the unknown term is squared and there is no unknown term raised to the first power. The general form of a pure quadratic is

$$ax^2 + c = 0 \quad (1)$$

The solution of this equation is to solve for  $x$  by transposing  $c$  to the right hand side, dividing both sides by  $a$ , and extracting the square root of both members, thus

$$x = \sqrt{-\frac{c}{a}} \quad (2)$$

*Example 1.* Solve:  $2x^2 - 8 = 0$ .

*Solution.* Transposing,  $2x^2 = 8$   
 Dividing by 2,  $x^2 = 4$   
 Extracting the square root of both sides,  $x = +2$  Ans.  
 or  $x = -2$  Ans.

*Illustration of a Quadratic Equation.*—The following illustration shows how a problem may lead to a quadratic equation. Referring to Fig. 53, it is desired to select the resistance  $R$  such that the resistance between terminals 1 and 2 is 4 ohms.

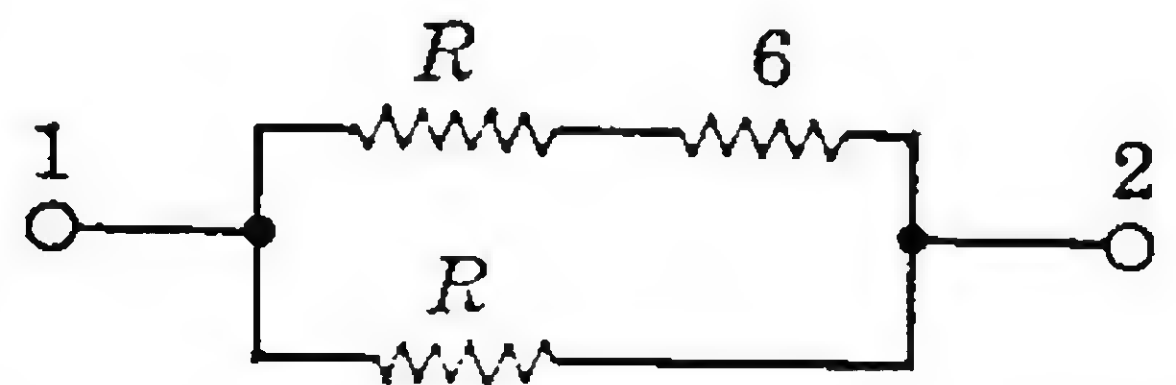

FIG. 53.—Series-parallel resistors.

The conditions of the problem can be expressed by the equation

$$4 = \frac{R(R + 6)}{R + (R + 6)} \quad (3)$$

Multiplying both sides of the equation by  $2R + 6$ , to clear the equation of fractions,

$$4(2R + 6) = R^2 + 6R \quad (4)$$

Transposing all terms to the left-hand side,

$$R^2 - 2R - 24 = 0 \quad (5)$$

This is a quadratic equation in  $R$ . If factored, it can be written

$$(R - 6)(R + 4) = 0 \quad (6)$$

This equation is true if  $R = 6$ , hence  $(6 - 6) = 0$  or if  $R = -4$  so that  $(-4 + 4) = 0$ . The resistance  $R$  can then be either 6 ohms or  $-4$  ohms. The value normally selected would be 6 ohms, because it is easier to obtain than a  $-4$  ohm resistance device. The two answers are the two roots of the equation.

**Example 2.** Solve the following equation by factoring.

$$x^2 - 4x - 21 = 0$$

The product of the two factors must equal  $-21$  and their sum must equal  $-4$ . It is soon discovered that  $+3$  and  $-7$  are factors that meet this condition, hence the equation can be factored and written

$$(x + 3)(x - 7) = 0$$

The solutions, then, are

$$x = -3 \quad \text{Ans.}$$

or

$$x = 7 \quad \text{Ans.}$$

**Methods of Solution.**—Quadratic equations can be solved by the methods of graphing, factoring, completing the square, or using the quadratic formula. The most useful method is the *quadratic formula*.

The *factoring method* is illustrated above. The other methods will be illustrated below.

**Illustration of the Graphic Method.**—Solve the quadratic equation,  $x^2 - 2x - 3 = 0$  by graphing the curve

$$y = x^2 - 2x - 3.$$

Since the zero is replaced by  $y$ , the solutions of  $x$  will be the value of  $x$  when  $y = 0$ .

To draw the graph of  $y = x^2 - 2x - 3$  the values of  $y$  are obtained when  $x$  is given values as shown in Fig. 54a. The solution will be the values of  $x$  when  $y = 0$ . In this case  $x = -1$

and  $x = 3$  are the desired roots. Moreover, if 0 is substituted for  $y$  in the equation these same roots can be obtained by any of the other methods of solution.

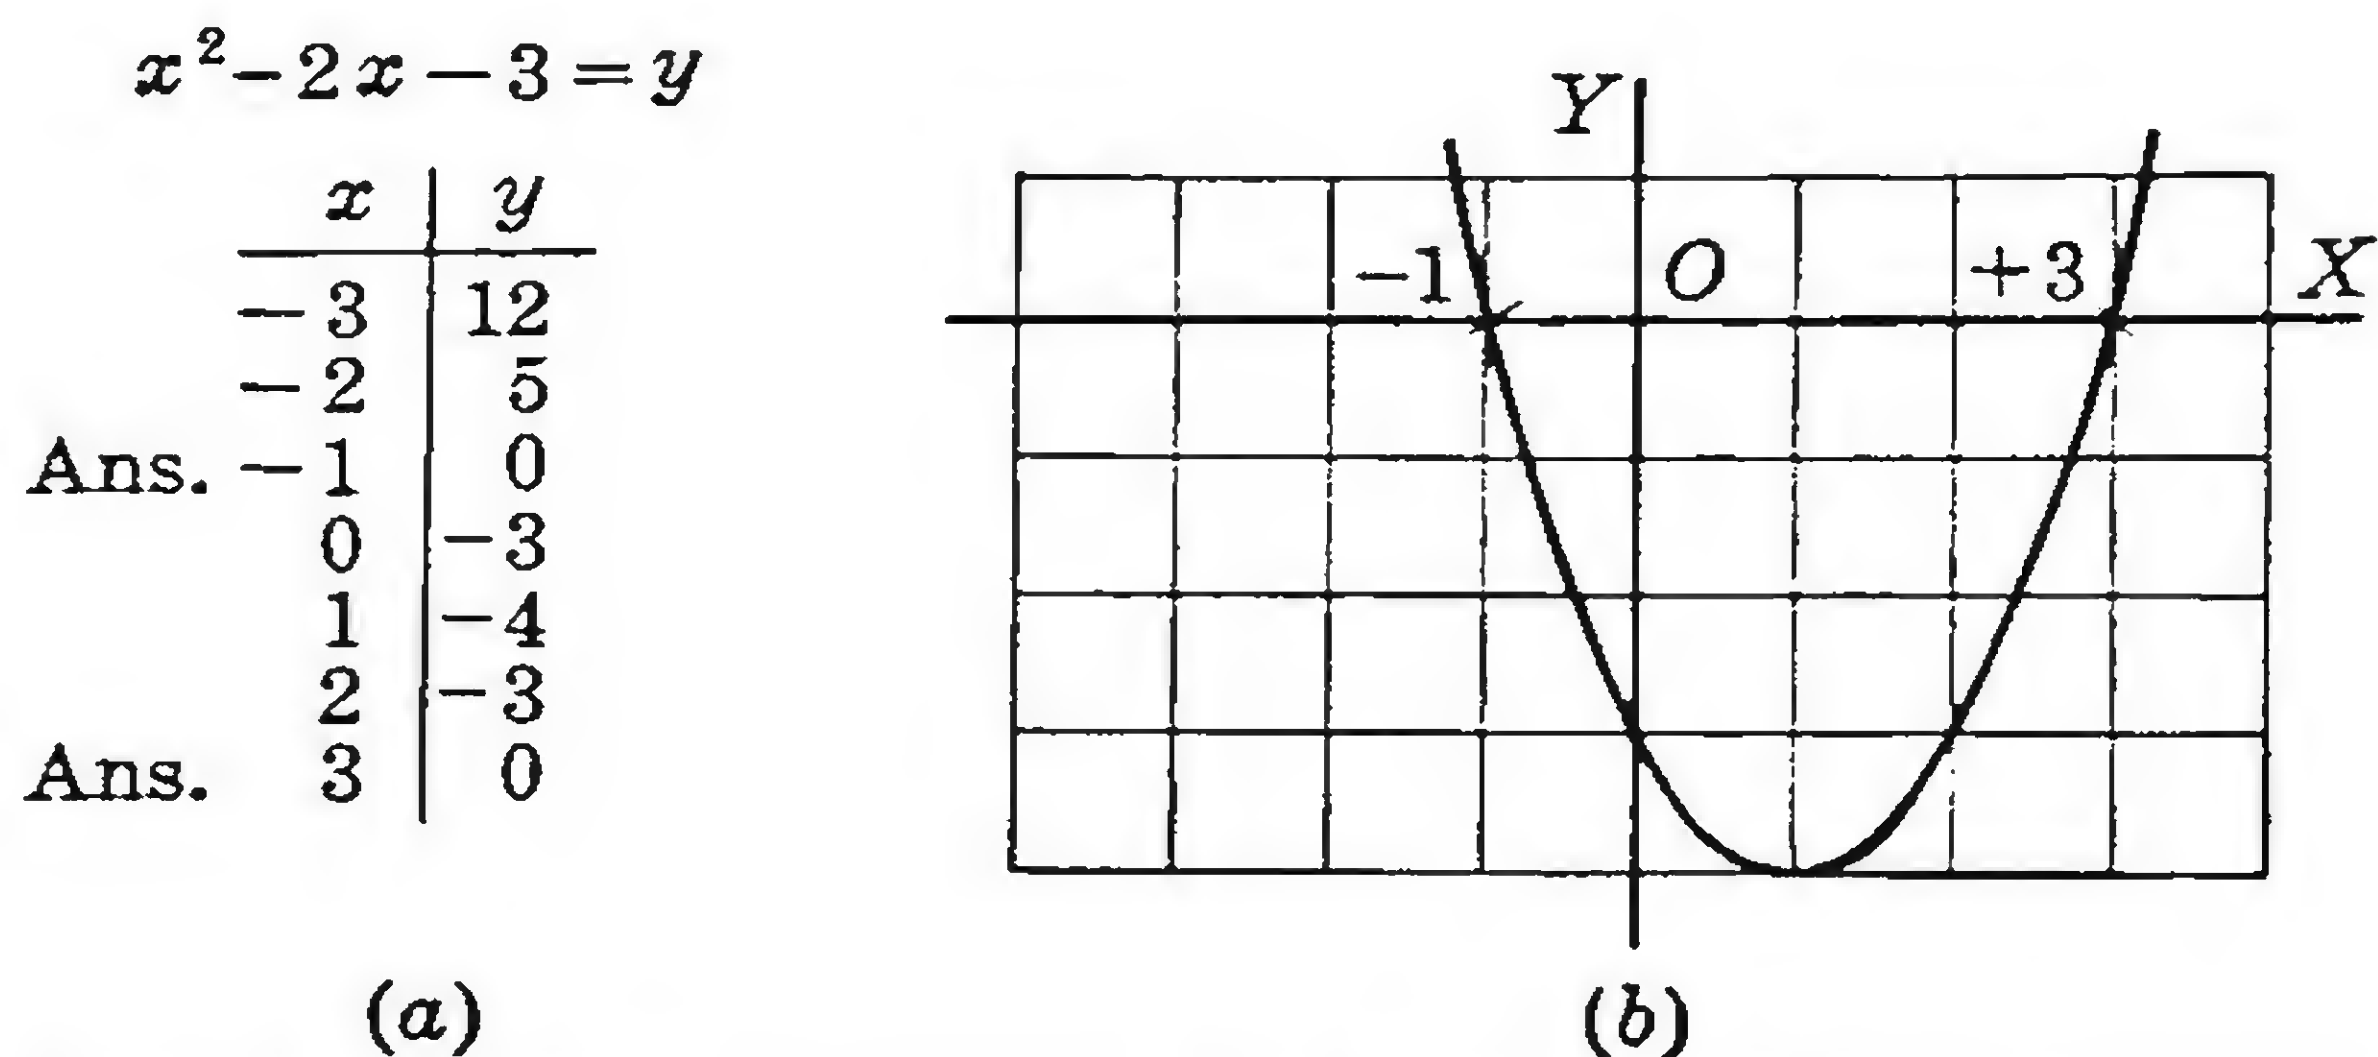

FIG. 54.—Graphical method of solving a quadratic equation.

The solution can be checked by *substituting first one root and then the other* to see if the original equation is satisfied, thus:

For  $x = -1$

$$(-1)^2 - 2(-1) - 3 = 0 \quad \text{or} \quad 1 + 2 - 3 = 0 \quad \text{Check.}$$

and  $x = 3$

$$(3)^2 - 2(3) - 3 = 0 \quad \text{or} \quad 9 - 6 - 3 = 0 \quad \text{Check.}$$

*Illustration of Completing the Square.*—Solve

$$x^2 + 6x - 16 = 0$$

by completing the square.

$$\text{Transposing, } -16 \qquad x^2 + 6x = 16 \qquad (7)$$

$$\text{Adding 9 to both members } x^2 + 6x + 9 = 25 \qquad (8)$$

Taking the square root of both members,

$$x + 3 = \pm 5 \qquad (9)$$

$$\text{Hence,} \qquad x = 5 - 3 = 2 \quad \text{Ans.}$$

$$\text{or} \qquad x = -5 - 3 = -8 \quad \text{Ans.}$$

Another *method of checking* by *multiplying the factors* is as follows: If  $x = 2$ , then  $x - 2 = 0$ ; if  $x = -8$ , then

$$x + 8 = 0;$$

and the product

$$(x - 2)(x + 8) = x^2 + 6x - 16 = 0 \qquad (10)$$

This checks the original equation.

**Quadratic Formula.**—The general form of the quadratic equation can be expressed

$$ax^2 + bx + c = 0 \quad (11)$$

In the above illustration,  $x^2 + 6x - 16 = 0$ , we have  $a = 1$ ,  $b = 6$ , and  $c = -16$ .

Dividing the general quadratic equation by  $a$ ,

$$x^2 + \frac{b}{a}x + \frac{c}{a} = 0 \quad (12)$$

Transposing  $c/a$

$$x^2 + \frac{b}{a}x = -\frac{c}{a} \quad (13)$$

This corresponds to Eq. (7) in the above illustration. Adding to both members the square of  $b/2a$ ,

$$x^2 + \frac{b}{a}x + \frac{b^2}{4a^2} = -\frac{c}{a} + \frac{b^2}{4a^2} \quad (14)$$

In the above illustration note that  $\frac{1}{2}$  of 6 when squared gives 9. See Eq. (8).

Find the square root of both members of the equation, using both  $+$  and  $-$  roots of the right-hand member, thus

$$x + \frac{b}{2a} = \pm \sqrt{\frac{b^2}{4a^2} - \frac{c}{a}} \quad (15)$$

This corresponds to Eq. (9) of the illustration. Using first the positive value and then the negative one results in two new equations of  $x$ ,

$$x = \frac{-b}{2a} + \sqrt{\frac{b^2}{4a^2} - \frac{c}{a}} \quad (16)$$

and

$$x = \frac{-b}{2a} - \sqrt{\frac{b^2}{4a^2} - \frac{c}{a}} \quad (17)$$

These equations correspond to  $x = 5 - 3 = 2$  and

$$x = -5 - 3 = -8$$

in the above illustration.

If the  $b/2a$  of Eq. (15) is transposed to the other side, the  $c/a$  term multiplied by  $4a$  in both numerator and denominator,

and the two terms under the radical reduced to a common denominator, then

$$x = \frac{-b}{2a} \pm \sqrt{\frac{b^2 - 4ac}{4a^2}} \quad (18)$$

Since the square root of  $4a^2$  is  $2a$ , it can be written outside the radical as a common denominator, thus

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \quad (19)$$

This is the *quadratic formula*, which should be *memorized*. In words it is usually stated “*x equals minus b plus or minus the square root of b squared minus four ac, all divided by two a.*”

*Example 3.* Solve the following equation by means of the quadratic formula:

$$3R^2 - 7R + 4 = 0$$

In applying the formula it is noted that  $a$  is  $+3$ ,  $b$  is  $-7$ , and  $c$  is  $+4$ , the unknown number being  $R$  instead of  $x$ . Making these substitutions in Eq. (19), the formula gives

$$R = \frac{-(-7) \pm \sqrt{(-7)^2 - 4(3)(4)}}{2(3)}$$

Simplifying further,

$$R = \frac{7 \pm \sqrt{49 - 48}}{6}$$

Hence

$$R = \frac{7 + 1}{6} = \frac{4}{3} \quad \text{Ans.}$$

and

$$R = \frac{7 - 1}{6} = 1 \quad \text{Ans.}$$

Check by the sum and product of the roots method is done as follows: Adding the two roots as given in Eqs. (16) and (17),

$$\frac{-b}{2a} + \frac{-b}{2a} = \frac{-b}{a}$$

Adding the two roots in the answers,

$$\frac{4}{3} + 1 = \frac{7}{3}$$

or

$$\frac{-(-7)}{3} = \frac{-b}{a}$$

Multiplying the two roots as given in Eqs. (16) and (17) by the method as illustrated on page 41 for  $(x + y)(x - y) = x^2 - y^2$ ,

$$\left(\frac{-b}{2a}\right)^2 - \left(\sqrt{\frac{b^2 - 4ac}{4a^2}}\right)^2 = \frac{c}{a} \quad (20)$$

In this example the product of the two roots is  $(\frac{4}{3})(1) = \frac{4}{3}$  which should and does equal  $c/a$ .

The quadratic equation will now be explained in more detail. The general form of the quadratic equation is

$$ax^2 + bx + c = 0 \quad (11)$$

The first term  $ax^2$  is made up of a product of a known number  $a$  and the unknown number  $x$  raised to the second power,  $(x^2)$ . The second term is also a product of a known number,  $b$ , and the unknown number,  $x$ . The third term is simply another known number,  $c$ . It might be asked why these terms, added together, make a quadratic quantity that is equal to zero. That will be seen to be true when  $a$ ,  $b$ ,  $c$ , and  $x$  are explained. First,  $a$  is a known number. It can be a positive number (greater than zero) or a negative number (less than zero). It can never be zero (see definition at end of the chapter). Second,  $b$  can also be a positive or negative number, but it can also be zero. Third,  $c$  can be a positive or negative number or zero. Now if  $a$ ,  $b$ , and  $c$  are integer numbers it is easy to find a value of  $x$  that will make the quadratic quantity

$$ax^2 + bx + c$$

equal to zero. To illustrate, if  $a = 2$ ,  $b = -5$ , and  $c = 3$ , then  $ax^2 + bx + c$  will be the quadratic quantity  $2x^2 - 5x + 3$ . Hence it is plainly possible to find a value for  $x$  that will make this quadratic quantity in  $x$  equal to zero. In fact there are two values of  $x$  that will make  $2x^2 - 5x + 3$  equal to zero.

But instead of going into the methods of finding these values of  $x$  it is more important at this point of the discussion to understand what the problem is. These coefficients  $a$ ,  $b$ , and  $c$ , even though they are known numbers, might cause the student considerable trouble unless he realized what they meant. Instead of being numerals, each of them might be a quantity, so we should really consider them as expressions. Just as  $a$  stands for the whole thing by which  $x^2$  is multiplied,  $b$  stands for the whole thing by which  $x$  is multiplied, and  $c$  stands for the whole thing by which unity (1) is multiplied. Since  $c$  is made up of the constant terms, it is often referred to as the constant of the equation. If the quadratic equation is not arranged so that the coefficient of  $x^2$ , which is  $a$ , can be seen and dealt with as a term or quantity,

it must be rearranged. Likewise the coefficient of  $x$ , namely  $b$ , must be rearranged and collected into a quantity. When  $a$ ,  $b$ , and  $c$  can be written down and the equation is arranged according to the descending powers of  $x$  with the right side of the equation zero, then the quadratic equation is in its standard form and is ready to solve. To illustrate, the quadratic equation

$$7 + kx + 9x^2 + k = 17x + 8kx^2 + 6$$

is rearranged as follows:

$$(9 - 8k)x^2 + (k - 17)x + (k + 1) = 0$$

This rearranged equation is the same as the other quadratic equation but is in its standard form with  $a$  equal to  $(9 - 8k)$ ,  $b$  equal to  $(k - 17)$  and  $c$  equal to  $(k + 1)$ . When the student is able to rearrange any kind of quadratic equation so that it will be in its standard form, which is the general form

$$ax^2 + bx + c = 0,$$

then he is ready to solve any quadratic equation he may encounter.

**Use of the Discriminant  $b^2 - 4ac$ .**—The quantity  $b^2 - 4ac$  under the radical in the quadratic formula is called the *discriminant* because its value decides whether the roots are *equal or unequal*, *real or complex*, *rational or irrational*.

*Case I.* If  $b^2 - 4ac$  is zero the roots are *equal and real*. For illustration, in the equation

$$4x^2 - 12x + 9 = 0$$

$$a = 4, b = -12, c = 9 \text{ and } b^2 - 4ac = 144 - 144 = 0.$$

The usual solution is written

$$x = \frac{12 + \sqrt{0}}{8} \quad \text{and} \quad x = \frac{12 - \sqrt{0}}{8}$$

both of which reduce to 1.5. Hence the roots are equal and real.

*Case II.* If  $b^2 - 4ac$  is *positive* (greater than zero) the roots are *unequal and real*. For illustration, in the equation

$$3x^2 - 7x - 20$$

$$a = 3, b = -7, c = -20 \text{ and } b^2 - 4ac = 49 + 240 = 289.$$

The roots are

$$x = \frac{7 + \sqrt{289}}{6} = \frac{7 + 17}{6} = 4$$

and

$$x = \frac{7 - \sqrt{289}}{6} = \frac{7 - 17}{6} = -\frac{5}{3}$$

which are unequal and real.

*Case III.* If  $b^2 - 4ac$  is *negative* (less than zero) the roots are *unequal and complex* numbers. For illustration, in the equation

$$3x^2 - 2x + 1 = 0$$

$a = 3$ ,  $b = -2$ ,  $c = 1$ , and  $b^2 - 4ac = 4 - 12 = -8$ . The roots are

$$x = \frac{2 + \sqrt{-8}}{6} = \frac{1 + j\sqrt{2}}{3}$$

and

$$x = \frac{2 - \sqrt{-8}}{6} = \frac{1 - j\sqrt{2}}{3}$$

where  $j^2 = -1$  or, taking the square root,  $j = \sqrt{-1}$ .

These roots are unequal and complex numbers.

*Case IV.* If  $b^2 - 4ac$  is an *exact square* or *zero* the roots are *rational*, otherwise they are irrational. For illustration, in the equation

$$x^2 - 5x + 4 = 0$$

$a = 1$ ,  $b = -5$ ,  $c = 4$  and  $b^2 - 4ac = 25 - 16 = 9$ .

The roots are

$$x = \frac{5 + \sqrt{9}}{2} = 4$$

and

$$x = \frac{5 - \sqrt{9}}{2} = 1$$

These roots are rational numbers. But in the illustration of the equation

$$x^2 - 5x - 3 = 0$$

$a = 1$ ,  $b = -5$ ,  $c = -3$ , and  $b^2 - 4ac = 25 + 12 = 37$

The roots are

$$x = \frac{5 + \sqrt{37}}{2}$$

and

$$x = \frac{5 - \sqrt{37}}{2}$$

These roots are irrational numbers, because  $\sqrt{37}$  cannot be expressed as a fraction.

It is very important to have a clear understanding of what the solution of a quadratic equation means. A further discussion of the discriminant should assist in giving a clear meaning of the solution.

A quadratic equation in one unknown number has two values of that unknown that will make it true. If  $x$  is the unknown number, there will always be two values of  $x$  that will satisfy the equation, but they don't have to be integers. They can be fractions, irrational numbers, or complex numbers. There is only one case in which the two values of  $x$  are equal and that is when the quadratic in  $x$ , namely,  $ax^2 + bx + c$ , is a perfect square. Probably the best way for the student to understand the meaning of all these different situations is by graphing the quadratic as illustrated in this chapter. Then the student will see for himself that the curve of the quadratic function  $y$  ( $y$  being the value of  $ax^2 + bx + c$ ) crosses the  $x$ -axis twice in all cases but two. One is when the two values of  $x$  are equal and in this case the curve just touches the  $x$ -axis. The other case is when the curve does not touch or cross the  $x$ -axis. In this case both values of  $x$  that make  $y$  equal zero are complex numbers. One way of expressing the meaning of this solution is to say that the curve crosses the  $x$ -axis in two imaginary places, because the complex numbers involve the imaginary number  $\sqrt{-1}$ .

*Example 4.* Solve the following equations by the quadratic formula:

$$x^2 - 8x + 15 = 0 \quad (a)$$

$$x^2 - 8x + 16 = 0 \quad (b)$$

$$x^2 - 8x + 17 = 0 \quad (c)$$

Determine from the value of the discriminant the case number. Plot a graph of the equations.

*Solution.* By the quadratic formula the solutions are

$$\text{For Eq. (a), } x = \frac{8 \pm \sqrt{64 - 60}}{2} = 4 \pm 1 = 3 \text{ or } 5 \quad \text{Ans.}$$

$$\text{For Eq. (b), } x = \frac{8 \pm \sqrt{64 - 64}}{2} = 4 \quad \text{Ans.}$$

$$\text{For Eq. (c), } x = \frac{8 \pm \sqrt{64 - 68}}{2} = 4 \pm j1 \quad \text{Ans.}$$

The values of the discriminant are: For Eq. (a),  $b^2 - 4ac = 4$ , a positive number; hence the roots are unequal and real.—Case II. *Ans.*

For Eq. (b),  $b^2 - 4ac = 0$ ; hence the roots are equal and real.—Case I. *Ans.*

For Eq. (c),  $b^2 - 4ac = -4$ , a negative number; hence the roots are unequal and complex numbers.—Case III. *Ans.*

By Case IV, the roots of Eq. (a), (b), and (c) are rational.

The graphical solutions are as follows:

Eq. (a)	Eq. (b)	Eq. (c)
$y = x^2 - 8x + 15$	$y = x^2 - 8x + 16$	$y = x^2 - 8x + 17$
$\begin{array}{c c} y & x \\ \hline 8 & 1 \\ 3 & 2 \\ 0 & 3 \text{ Ans.} \\ -1 & 4 \\ 0 & 5 \text{ Ans.} \\ 3 & 6 \\ 8 & 7 \end{array}$	$\begin{array}{c c} y & x \\ \hline 9 & 1 \\ 4 & 2 \\ 1 & 3 \\ 0 & 4 \text{ Ans.} \\ 1 & 5 \\ 4 & 6 \\ 9 & 7 \end{array}$	$\begin{array}{c c} y & x \\ \hline 10 & 1 \\ 5 & 2 \\ 2 & 3 \\ \text{Imaginary} & 4 \text{ Ans.} \\ 2 & 5 \\ 5 & 6 \\ 10 & 7 \end{array}$

See Fig. 55 for the graphs of these equations. It will be noted that the imaginary solution locates the vertex of the parabola.

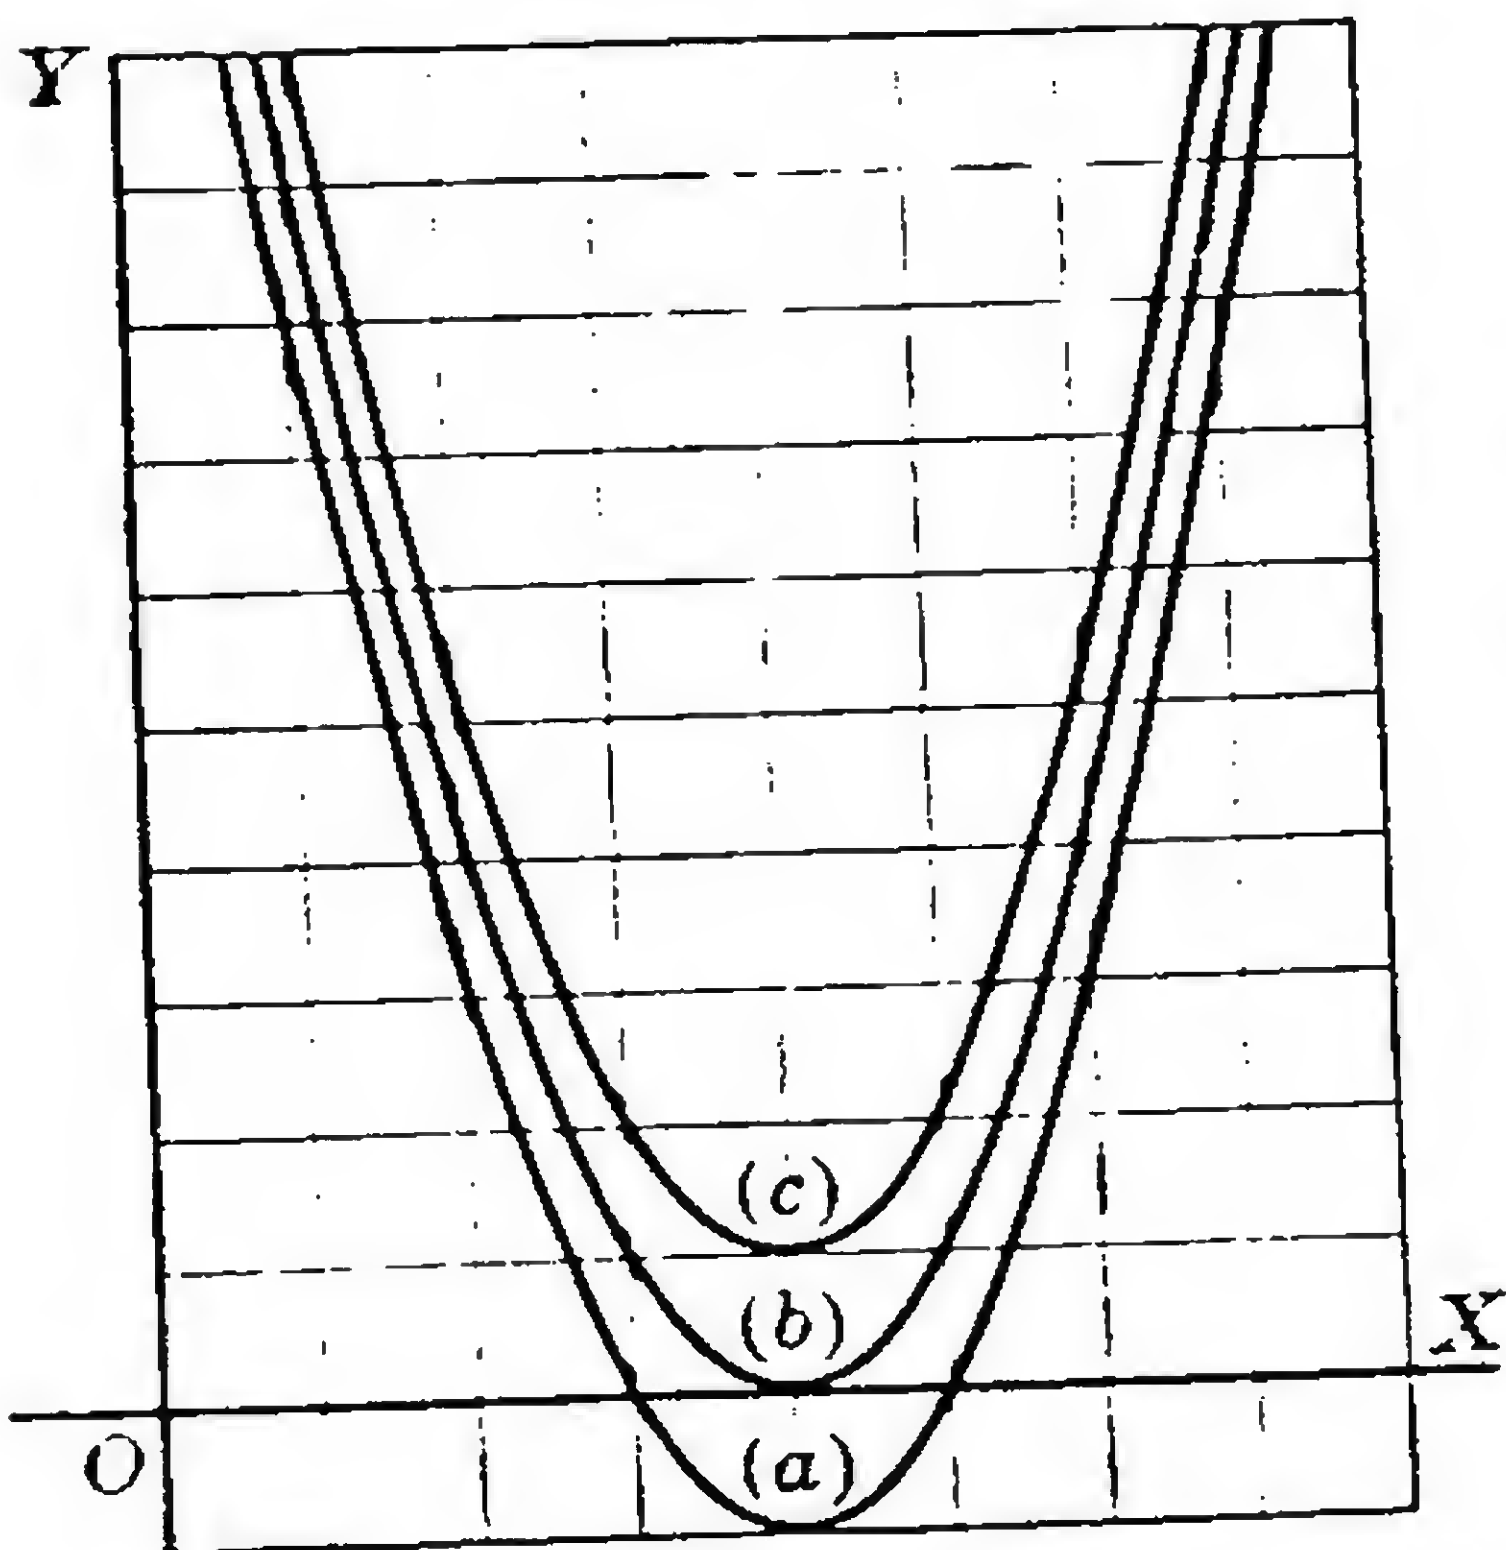

FIG. 55.—Graphic solutions of Eqs. (a), (b), and (c) in Example 4.

**Higher Powered Equations.** It is possible to solve equations to the third power in a manner similar to the above method of solving an equation to the second power, but, since this method will not be needed, it will not be treated here.

Some problems involving the fourth power can be worked by the quadratic formula and should be treated here, since the method will be useful for solving a few problems later in the course. These special equations can be reduced to

$$af^4 + bf^2 + c = 0 \quad (21)$$

In this type of problem let  $x = f^2$  and the general form of the quadratic formula results, that is,

$$ax^2 + bx + c = 0 \quad (11)$$

*Example 5.* In a certain series parallel circuit it is found that the frequency  $f$  can be expressed as

$$2 \times 10^{-12}f^4 - 6f^2 + 4 \times 10^{12} = 0$$

It is desired to solve this equation for  $f$  since this solution will give the frequency at which the circuit is resonant. At present we are interested only in the method; later in the course we shall be interested in the results of such a solution.

*Solution.* Applying the quadratic formula,

$$\begin{aligned} f^2 &= \frac{6 \pm \sqrt{6^2 - 4(2 \times 10^{-12})(4 \times 10^{12})}}{2(2 \times 10^{-12})} \\ &= \frac{6 \pm \sqrt{36 - 32}}{4 \times 10^{-12}} = \frac{6 \pm 2}{4 \times 10^{-12}} \end{aligned}$$

$$\begin{aligned} f^2 &= 2 \times 10^{12} \quad \text{or} \quad f^2 = 1 \times 10^{12} \\ \text{Then, } f &= 1.414 \times 10^6 \quad \text{or} \quad f = 1 \times 10^6 \quad \text{Ans.} \end{aligned}$$

### Some Useful Definitions.

1. A *quadratic equation* is an equation of the second order. In other words, it is an equation in which the unknown number is raised to the second power (squared) and no higher power. The first power of the unknown can also be present in the equation but it doesn't have to be present. The second power *must* be present; if only the first power of the unknown is present, the equation is linear and not quadratic.

2. A *quantity* is a product or sum of numbers. These numbers may be known or unknown. Notice that a quantity is not an equation because it is not a statement of equality, and that it therefore does not have an equal sign in it.

3. A *term* is a product of numbers. These numbers may be known or unknown. Notice that a term can be a quantity, but that a quantity that is a sum is not a term.

4. An *expression* is a term or quantity, except that we think of an expression as a symbol that stands for something else or possibly for a class of things.

### Exercises

1.  $x^2 - 6x - 7 = 0$ . Solve by the factoring method.
2.  $x^2 + 12x = 28$ . Solve by completing the square.

3.  $x^2 - 6x - 4 = 0$ . Solve by using the quadratic formula.
4.  $4x^2 - 2x - 4 = 0$ . Solve by any method.
5.  $x + 1/x = 1\frac{1}{2}$ . Solve by any method.
6.  $2x^2 - (\sqrt{2} + \sqrt{2})x + \sqrt{2} = 0$ . Solve by any method.
7.  $rs^2 + rs = s(r^2 + r^2)$ . Solve by any method.
8. Solve the following equation for  $x$  by using the quadratic formula:  
 $kx^2 - 2kx + 9 = 0$ . Then find the value of  $k$  that will make the roots equal. This is done by setting the discriminant equal to zero and solving for  $k$ .
9.  $x^2 - (2 + k)x + 4 = 0$ . Follow the procedure used in Exercise 8.
10. Solve the following equation for the resonant frequency  $f$ .

$$2f^2 + 4000 = 200f^2.$$

## CHAPTER 11

### HYPERBOLIC TRIGONOMETRY

Since traveling waves on a transmission line are very conveniently expressed in terms of hyperbolic functions, this chapter will be devoted to the mathematics of these functions. To simplify the presentation, certain parallels will be made with circular trigonometry as studied in Chapter 5. Hyperbolic functions also have valuable applications in the design of attenuation networks and electric wave filters; hence they should be mastered before proceeding further in the course.

**Real Circular and Hyperbolic Angles.**—In Fig. 56a, a circle with a unit radius is drawn. The equation of this circle with its center at the origin is

$$x^2 + y^2 = 1 \quad (\text{equation of a circle}) \quad (1)$$

If values of  $y$  from  $-1$  to  $+1$  are substituted in this equation the values of  $x$  obtained from the equation will vary from  $-1$  to  $+1$  and the points  $(x, y)$  will be on the circumference of the circle, hence this equation locates all points on the circumference of the circle and is known as the equation of this circle.

If the sign of  $y^2$  is changed from  $+$  to  $-$  the equation will no longer be the equation of a circle but that of a hyperbola as shown in Fig. 56b.

$$x^2 - y^2 = 1 \quad (\text{equation of a hyperbola}) \quad (2)$$

If values of  $y$  from  $-\infty$  to  $+\infty$  are substituted in Eq. (2) the corresponding values of  $x$  will vary from  $-\infty$  to  $+\infty$  and the points  $(x, y)$  will lie only on the curve as plotted in Fig. 56b and a similar branch on the other side of the  $y$ -axis not shown.

If a line is drawn from the origin  $O$  to some point  $P$  on the circumference of the circle it will make an angle  $\beta$  with the positive  $x$ -axis, as shown in Fig. 56a. If the radius of the circle is 1 inch and the shaded area  $AOP$  is 0.5 square inches, the angle  $\beta$  is 1 circular radian. Or, in equation form,

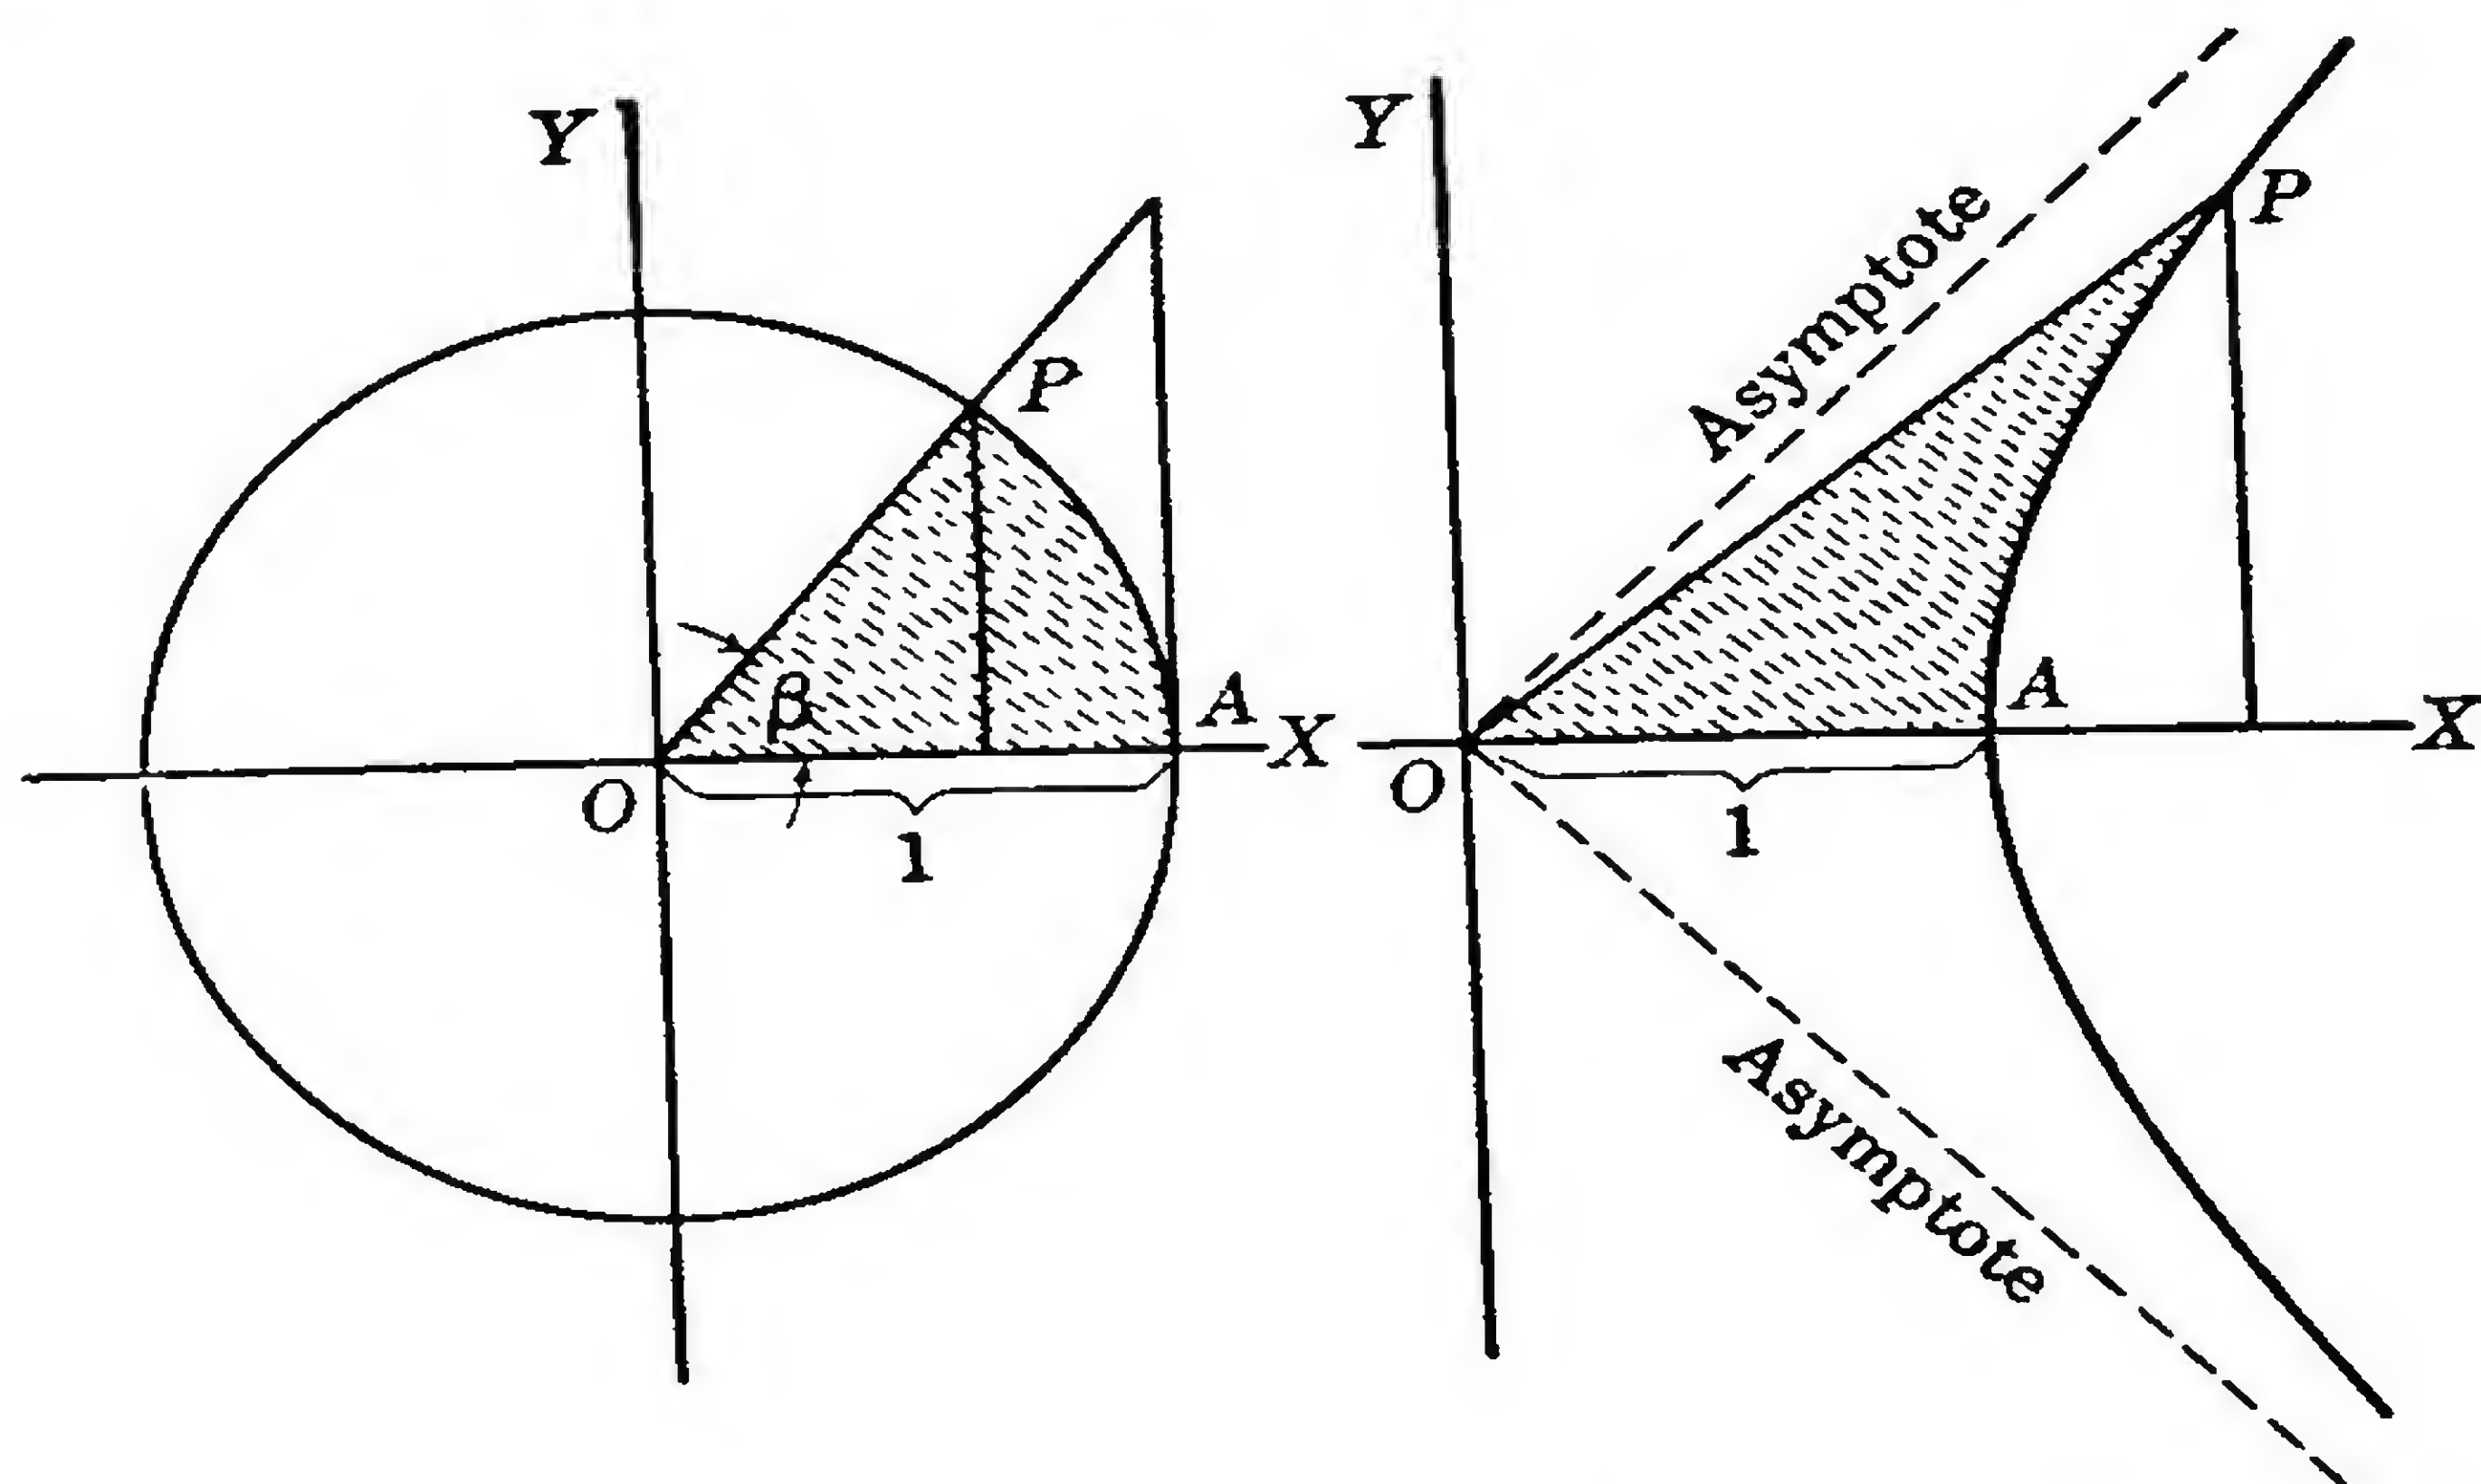

$$\beta = 2 (\text{shaded area}) \quad \text{circular radians} \quad (3)$$

when radius  $OA = \text{unity}$ .

When  $\beta = 1$  radian the arc  $AP$  is 1 in; hence for the above case the angle  $\beta$  is equal to the length of the arc in inches. If  $\beta$  is to be expressed in degrees the conversion can be made by recalling that in half a circle there are  $\pi$  radians or 180 degrees; hence

$$1 \text{ circular radian} = 57.296^\circ \quad (4)$$

If a line is drawn from the origin  $O$  to some point  $P$  on the hyperbola in Fig. 56b an angle will be made with the positive

(a) Equation of Circle  
 $x^2 + y^2 = 1$   
 $\beta = 2$  (Shaded Area)

(b) Equation of Hyperbola  
 $x^2 - y^2 = 1$   
 $\alpha = 2$  (Shaded Area)

FIG. 56.—Comparison of circular and hyperbolic angle.

$x$ -axis. If the distance from the origin  $O$  to the hyperbola along the  $x$ -axis is 1 in. and the shaded area  $AOP$  is 0.5 sq in., the measure is 1 hyperbolic radian. Or, in equation form,

$$\alpha = 2 \text{ (shaded area)} \quad \text{hyperbolic radians} \quad (5)$$

when distance  $OA = \text{unity}$ .

*Example 1.* In Fig. 56 if  $y = 0.5$  determine the value of  $x$  for the circle and for the hyperbola.

*Solution.* Substituting  $y = 0.5$  in Eq. (1) for the circle,

$$x^2 + (0.5)^2 = 1$$

$$x = \sqrt{1 - (0.5)^2} = \sqrt{0.75} = \pm 0.866 \quad \text{Ans.}$$

or

Substituting  $y = 0.5$  in Eq. (2) for the hyperbola,

$$x^2 - (0.5)^2 = 1$$

or 
$$x = \sqrt{1 + (0.5)^2} = \sqrt{1.25} = \pm 1.118 \quad \text{Ans.}$$

**Construction of Trigonometric Circular and Hyperbolic Angle.**  
Figure 57 illustrates a portion of Fig. 56, showing the construction of trigonometric functions for the circular angle  $\beta$  in Fig. 57a and hyperbolic angle  $\alpha$  in Fig. 57b.

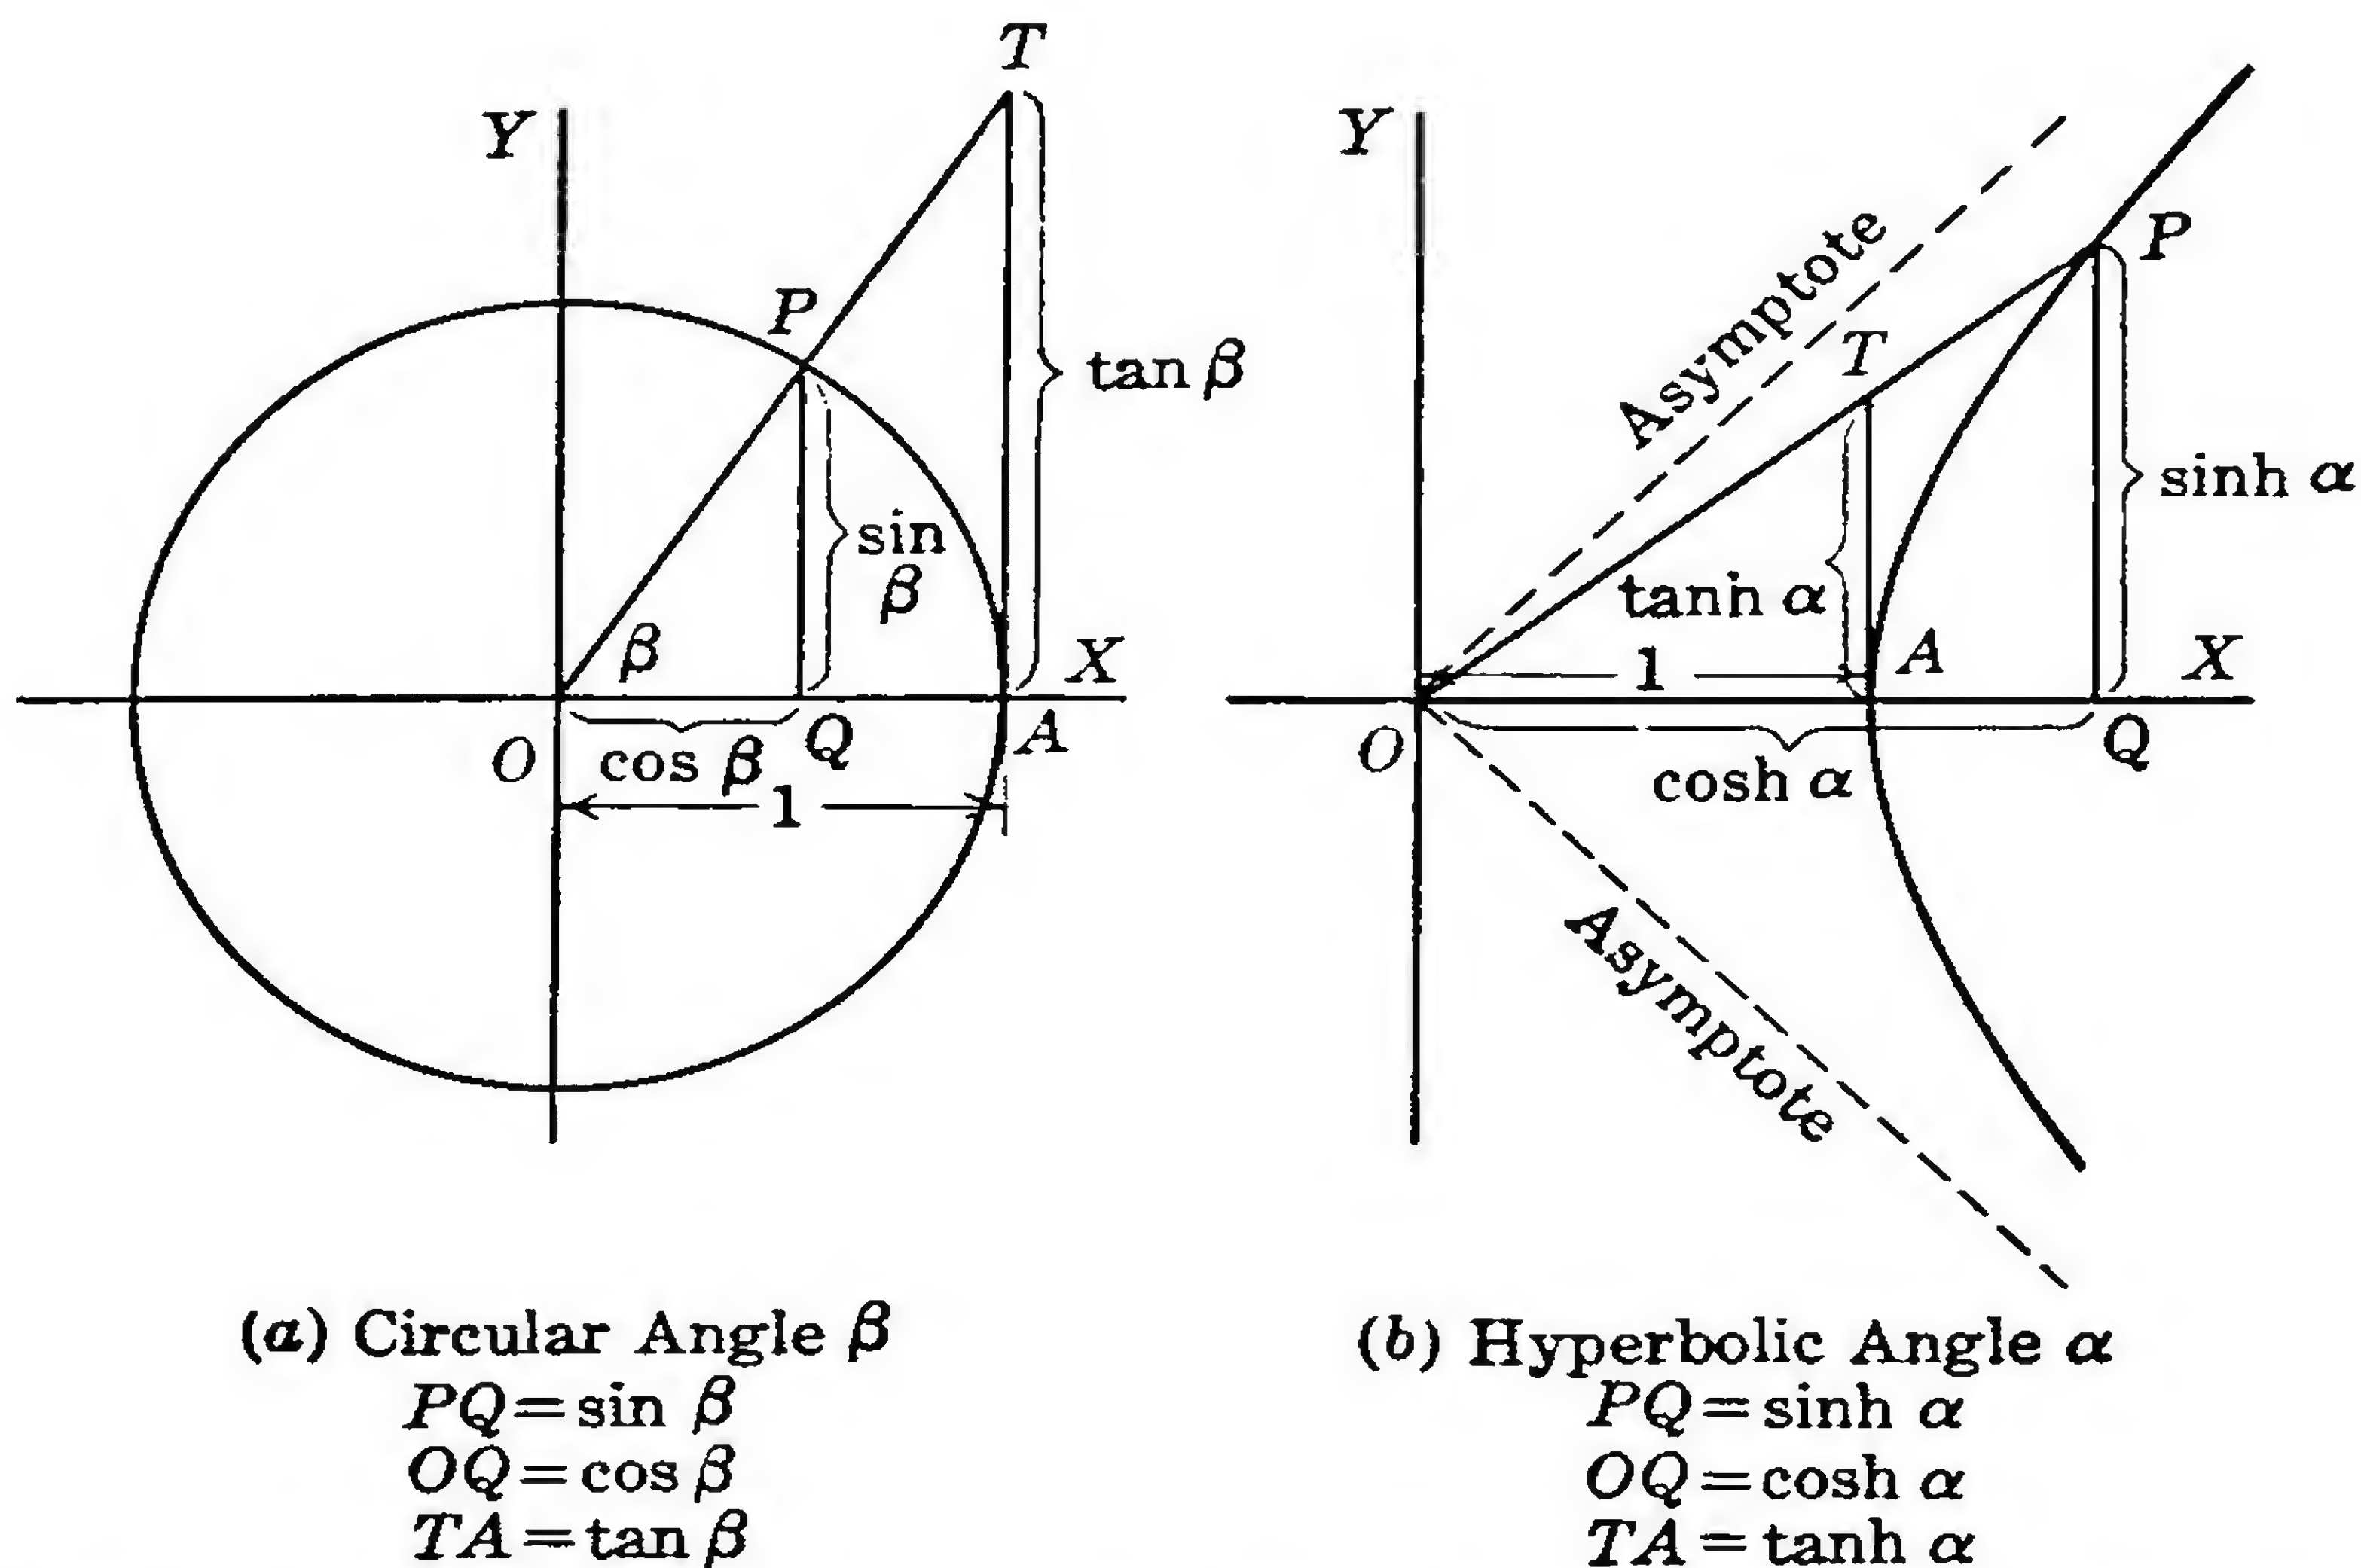

FIG. 57.—Construction of trigonometric function from circular and hyperbolic angle.

It will be recalled that the circular functions were explained in Chapter 5. A review will be given here. The circle of Fig. 57a is constructed with a radius of unity, then the hypotenuse of the triangle  $OP$  is unity and the sine of  $\beta$  is the distance  $PQ$  over  $OP$  (which is unity) hence

$$\sin \beta = \frac{PQ}{OP} = \frac{PQ}{1} = PQ \quad (6)$$

Similarly the cosine of  $\beta$  is  $OQ/OP$ , or simply

$$\cos \beta = \frac{OQ}{OP} = \frac{OQ}{1} = OQ \quad (7)$$

The tangent of  $\beta$  is the ratio  $PQ/OQ$  or if the similar triangle  $TAO$  is used the base  $OA = \text{unity}$  and the tangent is simply

$$\tan \beta = \frac{\sin \beta}{\cos \beta} = \frac{PQ}{OQ} = \frac{TA}{OA} = \frac{TA}{1} = TA \quad (8)$$

Referring now to Fig. 57b, similar relationships are drawn. In order to distinguish the trigonometric functions in a hyperbola the letter "h" (for hyperbola) is added and the functions are called

sinh = hyperbolic sine  
cosh = hyperbolic cosine  
tanh = hyperbolic tangent

If the hyperbola is drawn from Eq. (2) such that  $OA = \text{unity}$  the hyperbolic functions are readily drawn as shown in Fig. 57b. In this case the hyperbolic sine is simply the distance  $PQ$ , that is

$$\sinh \alpha = \frac{PQ}{OA} = \frac{PQ}{1} = PQ \quad (9)$$

The hyperbolic cosine is simply the distance  $OQ$ , that is

$$\cosh \alpha = \frac{OQ}{OA} = \frac{OQ}{1} = OQ \quad (10)$$

The hyperbolic tangent is the ratio  $PQ/OQ$  or, if the similar triangle  $TAO$  is used, the base  $OA = \text{unity}$  and the hyperbolic tangent is simply

$$\tanh \alpha = \frac{\sinh \alpha}{\cosh \alpha} = \frac{PQ}{OQ} = \frac{TA}{OA} = \frac{TA}{1} = TA \quad (11)$$

**Example 2.** Using the positive value of  $x$  in Example 1, determine the value of the trigonometric and hyperbolic functions.

**Solution.** The trigonometric functions are

$$\text{By Eq. (6)} \quad \sin \beta = PQ = y = 0.5 \quad \text{Ans.}$$

$$\text{By Eq. (7)} \quad \cos \beta = OQ = x = 0.866 \quad \text{Ans.}$$

$$\text{By Eq. (8)} \quad \tan \beta = \frac{PQ}{OQ} = \frac{y}{x} = 0.577 \quad \text{Ans.}$$

The hyperbolic functions are

$$\text{By Eq. (9)} \quad \sinh \alpha = PQ = y = 0.5 \quad \text{Ans.}$$

$$\text{By Eq. (10)} \quad \cosh \alpha = OQ = x = 1.118 \quad \text{Ans.}$$

$$\text{By Eq. (11)} \quad \tanh \alpha = \frac{PQ}{OQ} = \frac{y}{x} = 0.447 \quad \text{Ans.}$$

It should be noted that the *circular angle*  $\beta$  is measured in *circular radians*, while the *hyperbolic angle*  $\alpha$  is measured in *hyperbolic radians*. These definitions are given in equation form in Eqs. (3) and (5), respectively. However, for practical purposes of determining the circular angle  $\beta$  or the hyperbolic angle  $\alpha$ , it is usually more convenient to use one of the trigonometric or hyperbolic functions given above.

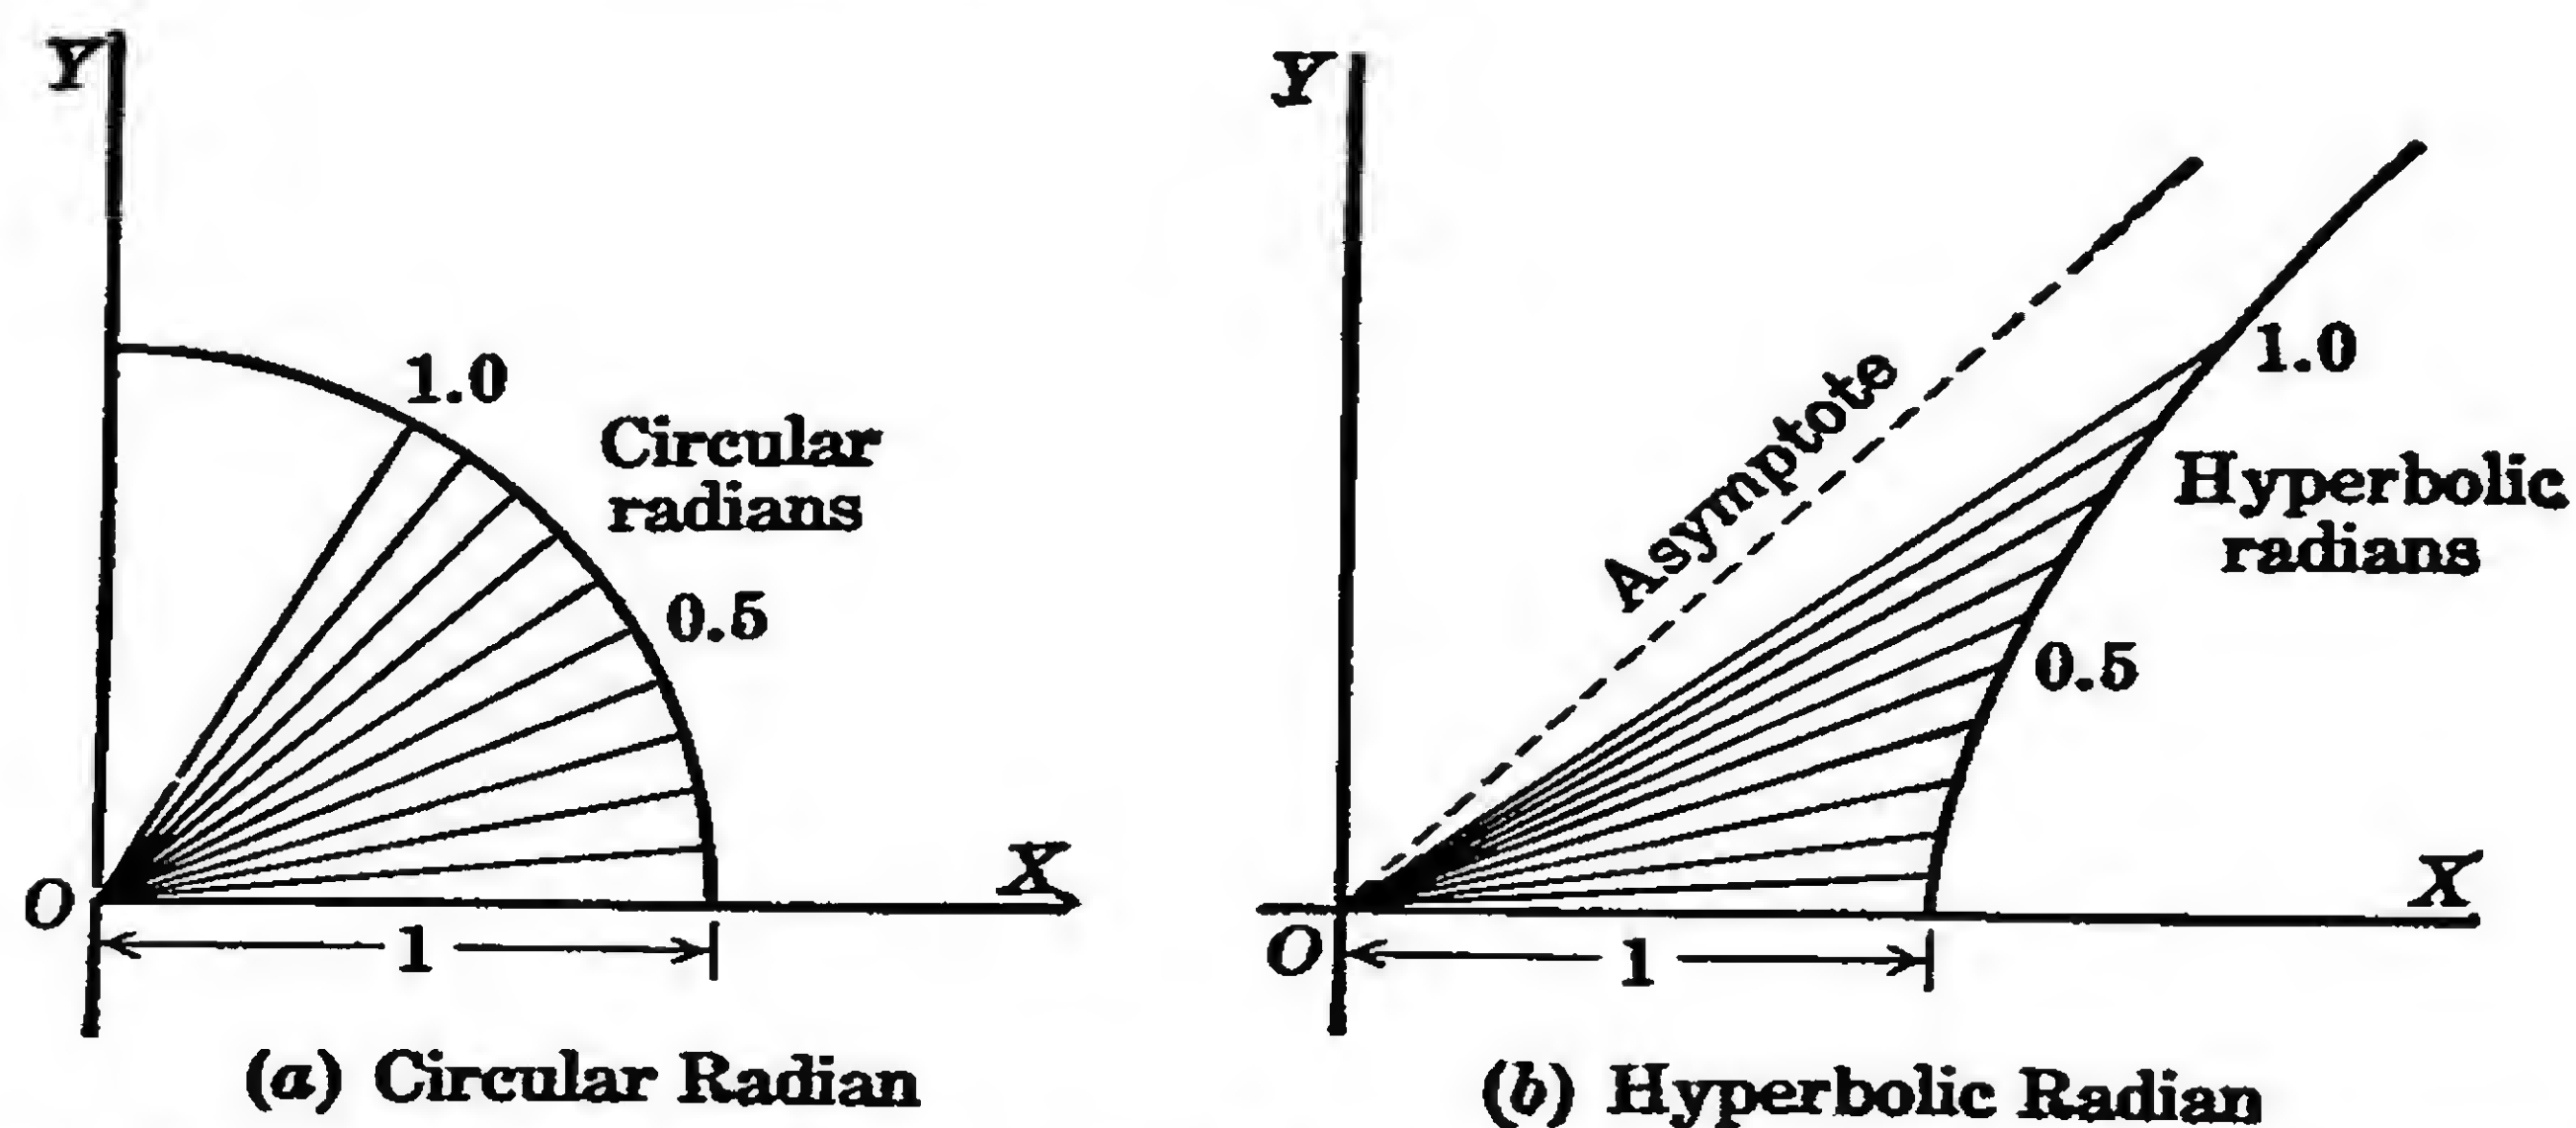

FIG. 58.—A circular and hyperbolic radian subdivided into 10 equal sectors of 0.1 radian each.

Figure 58a illustrates how a circular angle corresponding to 1 circular radian can be divided into 10 equal parts, each of 0.1 radian. If the radius is unity, each arc will be of a constant length of 0.1. Figure 58b illustrates how a hyperbolic angle corresponding to 1 hyperbolic radian can be divided into 10 equal hyperbolic angles, each of 0.1 radian. The arc corresponding to each subdivision increases as the hyperbolic angle increases. The length of the radii also increases (distance  $OP$ ) with the angle. In this illustration the circular and hyperbolic radian are similarly defined on the basis of equal area of circular and hyperbolic sectors.

**Example 3.** Determine the circular angle  $\beta$  and the hyperbolic angle  $\alpha$  when  $y = 0.5$  and  $x$  is positive.

**Solution.** From Example 2,

$$\sin \beta = 0.5$$

Then, from the tables of trigonometric functions,

$$\beta = 30^\circ = \frac{30}{57.296} = 0.5236 \text{ circular radians} \quad \text{Ans.}$$

Also, from Example 2,

$$\sinh \alpha = 0.5$$

Then, from the tables of hyperbolic functions and interpolating,

$$\alpha = 0.4810 \text{ hyperbolic radians. } \textit{Ans.}$$

**Graphs of Circular and Hyperbolic Functions.**—Already circular functions have been used to express the phase relations of voltage and current, but they cannot be used to express their magnitude. Hyperbolic functions, not being periodic, but continuously increasing or decreasing in nature, can be used to express the magnitude of voltage and current in a long line or

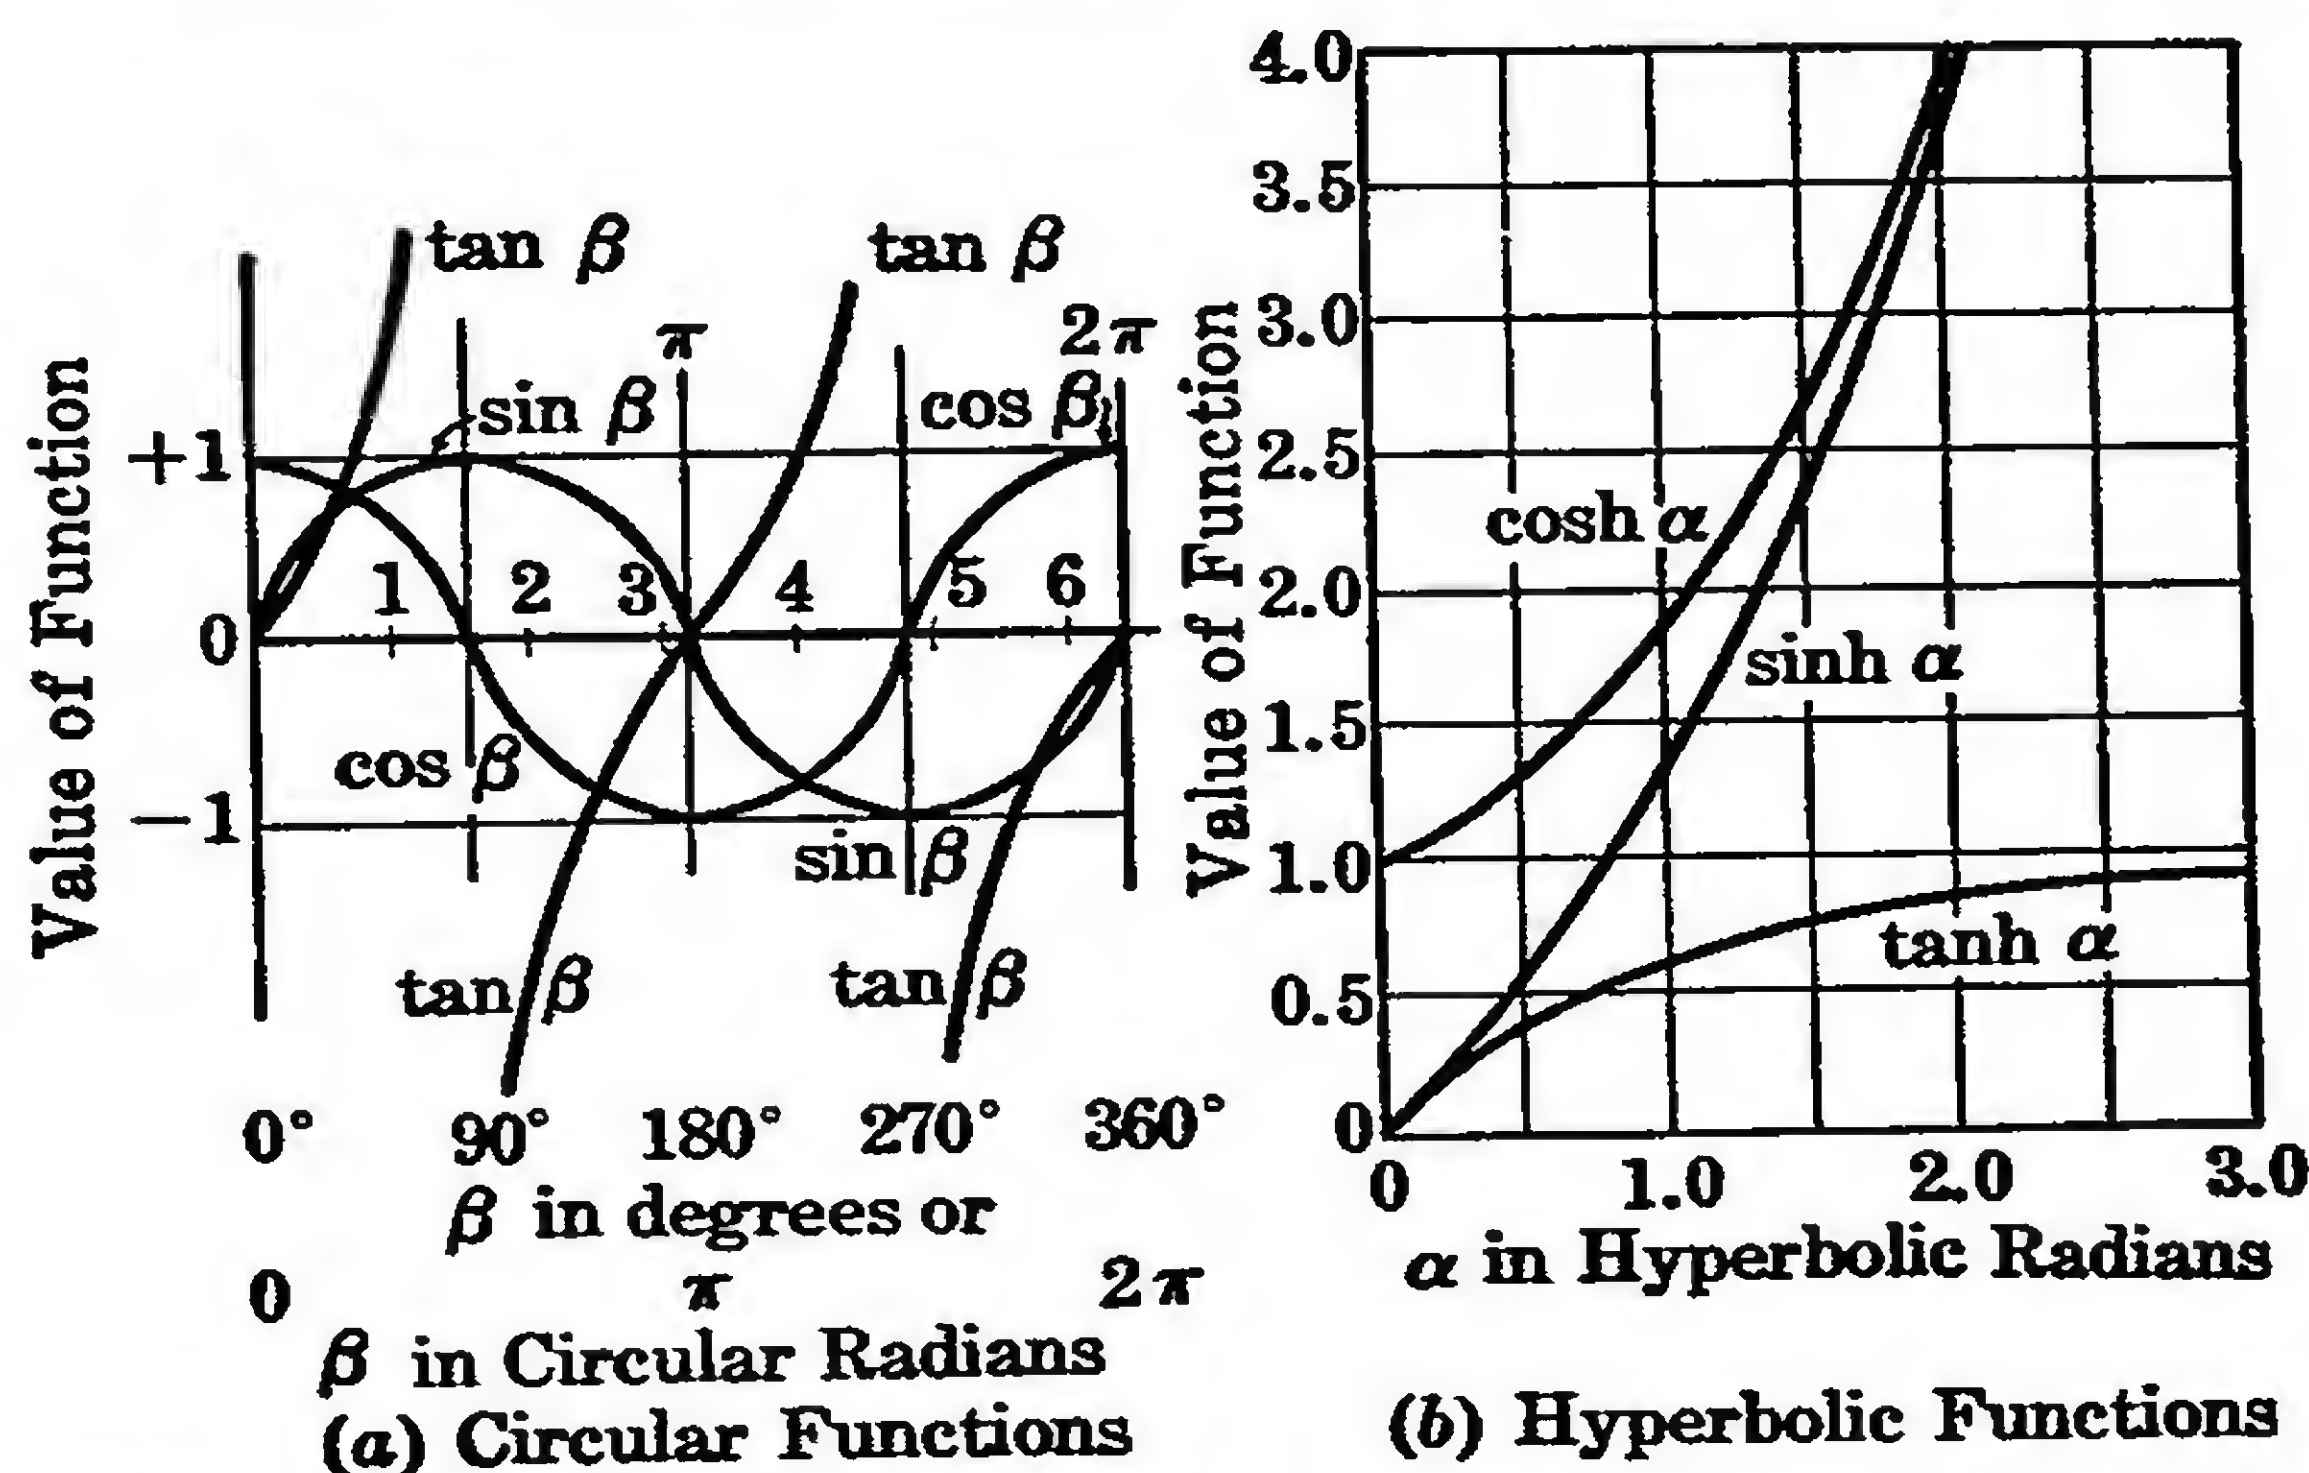

FIG. 59.—Graphical representation of circular and hyperbolic functions.

other networks requiring a change of magnitude of voltage and current.

Figure 59a illustrates trigonometric circular functions. The functions are periodic in nature. The sine function starts at 0, increases to +1, returns to 0, continues to -1 and returns to 0 ready to start another cycle of 360 degrees or  $2\pi$  radians. The cosine function starts at +1, drops through 0 to -1, and returns through 0 to +1, ready to start another cycle of 360 degrees or  $2\pi$  radians. The tangent function starts at 0, goes to  $+\infty$ , jumps to  $-\infty$ , and comes back to 0 ready to start another cycle of 180 degrees or  $\pi$  radians.

Figure 59b illustrates trigonometric hyperbolic functions. These functions are continuously increasing in nature. The

hyperbolic sine function starts at 0 and increases to  $+\infty$  as the hyperbolic angle in radians increases to  $+\infty$ . The hyperbolic cosine function starts at  $+1$  and increases to  $+\infty$  as the hyperbolic angle in radians increases to  $+\infty$ . For a given value of  $\alpha$ ,  $\cosh \alpha$  is always greater than  $\sinh \alpha$ , which in turn is always greater than  $\tanh \alpha$ .

The hyperbolic tangent function starts at 0 and increases to  $+1$  as the hyperbolic angle in radians increases to  $+\infty$ .

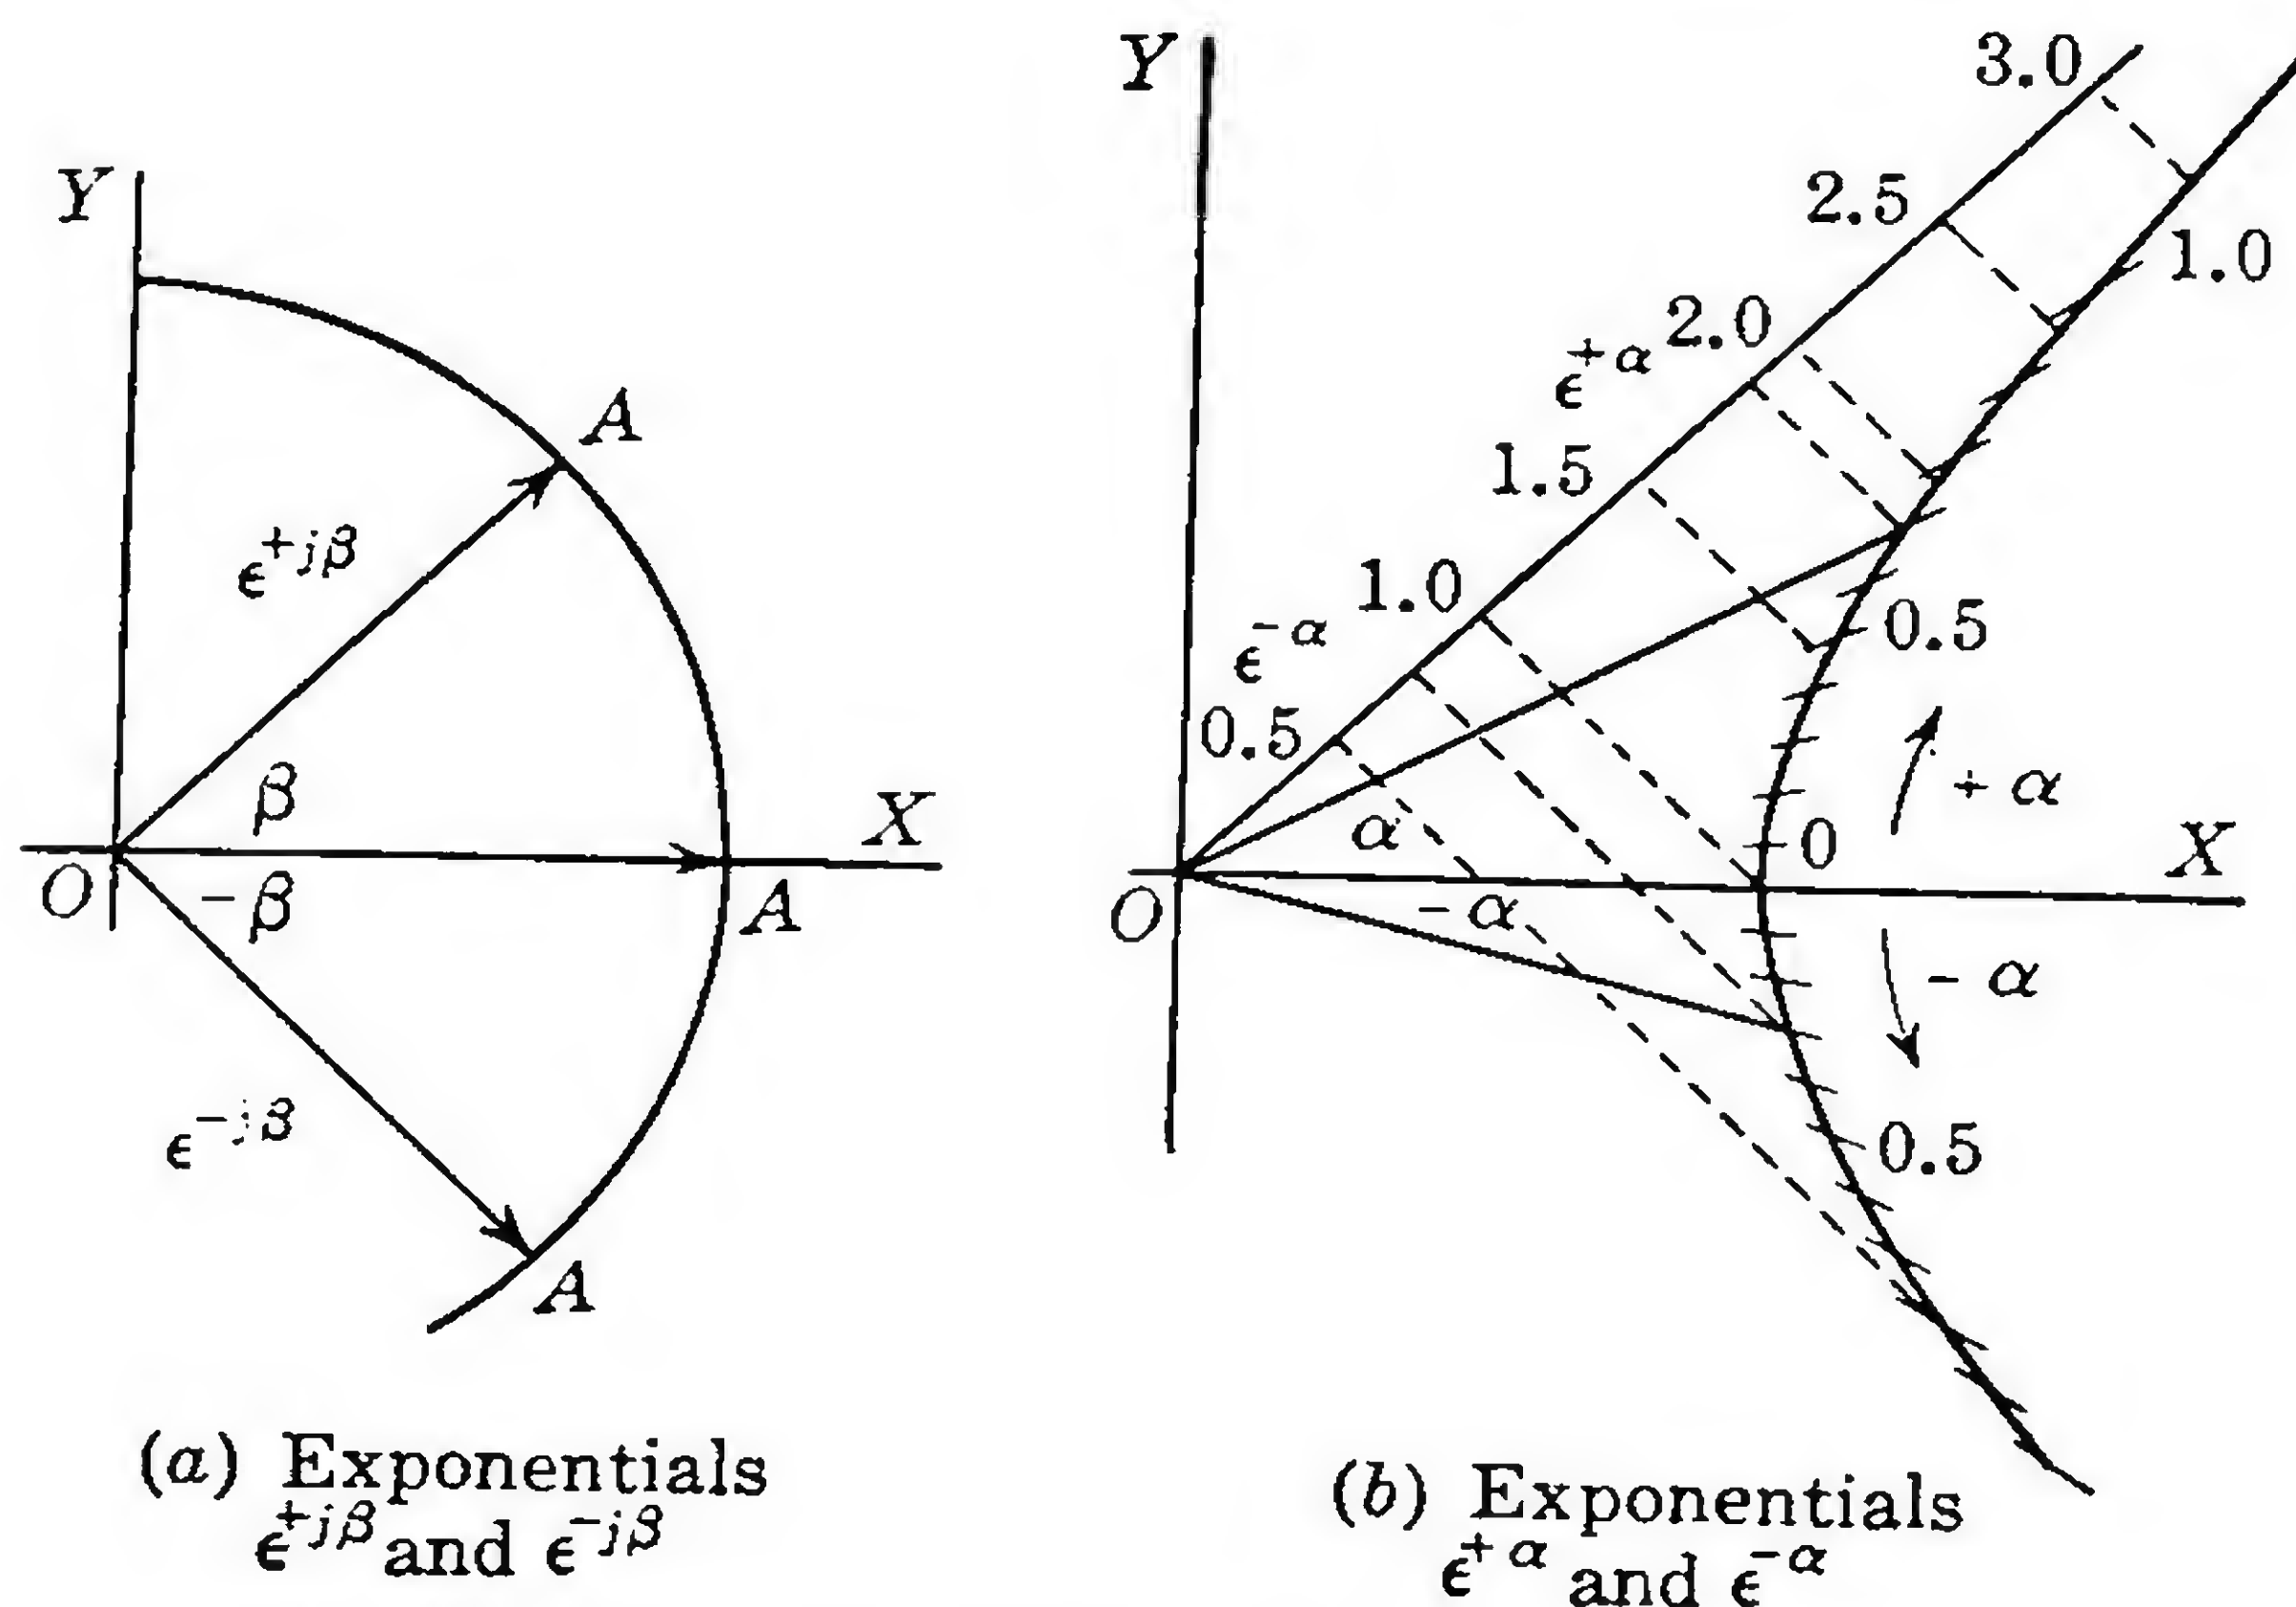

FIG. 60.—Geometric interpretation of exponentials.

**Geometrical Interpretation of the Exponentials  $e^{+j\beta}$ ,  $e^{-j\beta}$ ,  $e^{\alpha}$ , and  $e^{-\alpha}$ .**—It will be recalled that  $e^{-j\beta}$  multiplied by a vector will rotate the vector  $+\beta$  radians in a counterclockwise direction. Similarly,  $e^{+j\beta}$  multiplied by a vector will rotate the vector  $-\beta$  radians in a clockwise direction. Figure 60a illustrates the effect of multiplying  $e^{+j\beta}$  and  $e^{-j\beta}$  by a unit vector ( $OA$ ) originally lying along the positive  $x$ -axis.

If the points on the hyperbola of Fig. 60b corresponding to various hyperbolic angles are projected on the asymptote (the line bisecting the first quadrant—the hyperbola curve approaches this line and joins it at  $\infty$ ) as shown in the figure, the distance from the origin to the respective projection will be a measure of  $e^{\alpha}$ . It will be noted that for positive values of  $\alpha$  the value of  $e^{+\alpha}$  is greater than unity and that negative values of  $\alpha$  give  $e^{-\alpha}$  which is less than 1 but never less than 0.

**Exponentials Applied to Circular Functions.**—For our use, trigonometric functions do not need to be given a geometrical interpretation. In fact, they are sometimes defined by an algebraic exponential form. For example, the identity for changing from polar to rectangular form, which is

$$\epsilon^{+j\beta} = \cos \beta + j \sin \beta \quad (12)$$

is added to the form when the sign of  $\beta$  is made negative, thus

$$\epsilon^{-j\beta} = \cos (-\beta) + j \sin (-\beta) = \cos \beta - j \sin \beta \quad (13)$$

the result is

$$\epsilon^{+j\beta} + \epsilon^{-j\beta} = 2 \cos \beta \text{ or } \cos \beta = \frac{\epsilon^{+j\beta} + \epsilon^{-j\beta}}{2} \quad (14)$$

$\cos \beta$  is sometimes defined by this equation. Now, if Eq. (13) is subtracted from Eq. (12),

$$\epsilon^{+j\beta} - \epsilon^{-j\beta} = 2j \sin \beta \text{ or } \sin \beta = \frac{\epsilon^{+j\beta} - \epsilon^{-j\beta}}{2j} \quad (15)$$

$\sin \beta$  is sometimes defined by this equation.  $\tan \beta$  can be defined by the ratio, thus

$$\tan \beta = \frac{\sin \beta}{\cos \beta} = -j \frac{\epsilon^{+j\beta} - \epsilon^{-j\beta}}{\epsilon^{+j\beta} + \epsilon^{-j\beta}} \quad (16)$$

Also,  $\cot \beta$  can be defined as

$$\cot \beta = \frac{1}{\tan \beta} = \frac{\cos \beta}{\sin \beta} = j \frac{\epsilon^{+j\beta} + \epsilon^{-j\beta}}{\epsilon^{+j\beta} - \epsilon^{-j\beta}} \quad (17)$$

**Exponentials Applied to Hyperbolic Functions.**—From analogy with the circular trigonometric functions, the hyperbolic functions can be defined as follows:

$$\epsilon^{\alpha} = \cosh \alpha + \sinh \alpha \quad (18)$$

$$\epsilon^{-\alpha} = \cosh \alpha - \sinh \alpha \quad (19)$$

Subtracting Eq. (19) from Eq. (18) gives

$$\sinh \alpha = \frac{\epsilon^{\alpha} - \epsilon^{-\alpha}}{2} \quad (20)$$

$\sinh \alpha$  can be defined by this equation. Adding Eq. (18) and Eq. (19) gives

$$\cosh \alpha = \frac{\epsilon^{\alpha} + \epsilon^{-\alpha}}{2} \quad (21)$$

$\cosh \alpha$  can be defined by this equation.  $\tanh \alpha$  can be defined by the ratio

$$\tanh \alpha = \frac{\sinh \alpha}{\cosh \alpha} = \frac{\epsilon^\alpha - \epsilon^{-\alpha}}{\epsilon^\alpha + \epsilon^{-\alpha}} \quad (22)$$

In some equations it is more convenient to use the reciprocal of  $\tanh \alpha$  which is known as "hyperbolic cotangent" and can be defined as follows:

$$\coth \alpha = \frac{1}{\tanh \alpha} = \frac{\cosh \alpha}{\sinh \alpha} = \frac{\epsilon^\alpha + \epsilon^{-\alpha}}{\epsilon^\alpha - \epsilon^{-\alpha}} \quad (23)$$

*Example 4.* Determine the values of the exponentials for circular and hyperbolic functions when  $y = 0.5$  and  $x$  is positive.

*Solution.* From Examples 2 and 3 and the use of Eq. (12),

$$\begin{aligned} \epsilon^{j\beta} &= \cos \beta + j \sin \beta \\ \epsilon^{j0.5236} &= 0.866 + j0.5 = 1 \angle 30^\circ \quad \text{Ans.} \end{aligned}$$

From Examples 2 and 3 and the use of Eq. (18),

$$\begin{aligned} \epsilon^\alpha &= \cosh \alpha + \sinh \alpha \\ \epsilon^{0.4812} &= 1.118 + 0.5 = 1.618 \quad \text{Ans.} \end{aligned}$$

**Circular and Hyperbolic Identities.**—These identities are tabulated on page 307, primarily for reference purposes. The proof of many of these identities can be made by substitution of the exponential forms given above. In these equations  $\alpha$  is not necessarily a hyperbolic radian nor is  $\beta$  necessarily a circular radian. In general they can be considered as two different angles measured in radians.

*Example 5.* Develop the equation

$$\cosh^2 \beta - \sinh^2 \beta = 1$$

from the circular function identity

$$\sin^2 \beta + \cos^2 \beta = 1$$

*Solution.* In the circular function identity, replace  $\beta$  with  $j\beta$  to get

$$\sin^2 j\beta + \cos^2 j\beta = 1$$

But,

$$\sin j\beta = j \sinh \beta$$

and

$$\cos j\beta = \cosh \beta$$

Hence,

$$j^2 \sinh^2 \beta + \cosh^2 \beta = 1$$

or

$$\cosh^2 \beta - \sinh^2 \beta = 1 \quad \text{Ans.}$$

*Example 6.* Determine the circular sine and hyperbolic sine of the complex quantity

$$\gamma = \alpha + j\beta = 0.4812 + j0.5236$$

**Solution.** Referring to the list of identities,

$$\begin{aligned}\sin \gamma &= \sin (\alpha + j\beta) = \sin \alpha \cosh \beta + j \cos \alpha \sinh \beta \\ &= \sin (0.4812) \cosh (0.5236) + j \cos (0.4812) \sinh (0.5236)\end{aligned}$$

Converting from radians to degrees,

$$\sin \gamma = \sin (27.57^\circ) \cosh (0.5236) + j \cos (27.57^\circ) \sinh (0.5236)$$

Finding the values from the tables,

$$\begin{aligned}\sin \gamma &= (0.4628)(1.14025) + j(0.8865)(0.54786) \\ &= 0.5277 + j0.4857 = 0.7172/42^\circ 38' \quad \text{Ans.}\end{aligned}$$

From the list of identities,

$$\begin{aligned}\sinh \gamma &= \sinh (\alpha + j\beta) = \sinh \alpha \cos \beta + j \cosh \alpha \sin \beta \\ &= \sinh (0.4812) \cos (0.5236) + j \cosh (0.4812) \sin (0.5236) \\ &= (0.5) (0.866) + j (1.118) (0.5) \\ &= 0.433 + j0.559 = 0.7071/52^\circ 15' \quad \text{Ans.}\end{aligned}$$

### Exercises

1. If a circle has a radius of 1 in. and the vector  $OP$  (Fig. 56) is rotated so that the shaded area is 2 sq. in., what is the value of  $\beta$ ?
2. If a hyperbola measures 1 in. from  $O$  to  $A$  and the vector  $OP$  is turned clockwise so that the shaded area is 3 sq in., what is the value of  $\alpha$  and  $e^\alpha$  (see Fig. 56)?
3. In Eq. (1) if  $x = 0.707$  what are the possible values of  $y$ ?
4. In Eq. (2) if  $x = 2.0$  what are the possible values of  $y$ ?
5. How does the value of  $\cosh \alpha$  compare with  $\sinh \alpha$  as  $\alpha$  is varied? What are the corresponding values of  $\tanh \alpha$ ?
6. Between what limits do  $\sin \beta$  and  $\cos \beta$  vary? What are the limits of  $\tan \beta$ ?
7. What valuable property does  $e^{j\beta}$  have when multiplied by a vector? How is this property different from  $e^\alpha$  multiplied by the same vector?
8. If  $\tanh \alpha = 0.76159$ , determine  $\sinh \alpha$ ,  $\cosh \alpha$ ,  $\coth \alpha$ , and  $\alpha$ .

## CHAPTER 12

### DIFFERENTIAL CALCULUS TREATING ALGEBRAIC FUNCTIONS

*Arithmetic* deals with the use of *numbers*, which are constant quantities, while *algebra* deals with the use of *symbols* representing either constant or variable quantities. *Calculus*, going one step farther, deals with the *nature* and variation of these quantities. Since calculus uses both arithmetic and algebra, it is studied last.

The basic ideas of calculus are simple and fascinating when one has a good working knowledge of such subjects as algebra and trigonometry. However, the large amount of detail and the abstract approach that is often made lead to disinterest and to a false notion that the subject is extremely difficult.

Calculus in its elementary forms can be divided into differential calculus and integral calculus, much as arithmetic processes can be divided into subtraction and addition. In both the calculus and the arithmetic the processes are inverse operations.

The purpose of studying calculus at this time is to become familiar with the nature of changing electrical quantities. Not that the student will be able to work out all calculus problems, because even the best mathematicians cannot do this, but that the student can work simple problems and be able to understand the meaning of calculus terms when they are found in the literature. This chapter will deal with differential calculus in elementary and graphical forms which treat algebraic functions, while the next chapter will deal with transcendental functions in a similar fashion. Then a treatment of elementary and graphical forms of integral calculus will be presented.

All algebraic functions of  $x$  are rational functions, while all other functions of  $x$  are transcendental or irrational functions of  $x$ . An algebraic function of  $x$  can in its most complicated form be expressed as a fraction with values of  $x$  in both the numerator and denominator.

**Calculus Symbols.**—The letter  $d$  is used in differential calculus to mean “a little bit of,” hence “ $dx$ ” means “a little bit of  $x$ .” This little bit of  $x$  is a difference quantity, commonly called the “differential” or “element” of  $x$ .  $d$  can be remembered as the first letter of “difference” or “differential.” “ $dx$ ” is actually of indefinitely small size. Differential calculus can be simply explained as a mathematics of making and using indefinitely small difference calculations.

The symbol  $\int$  as used in integral calculus is merely an elongated letter  $S$  which means “the sum of.” This symbol which stands for the first letter of sum is usually called “the integral of,” which means the whole or total. Integral calculus can be simply explained as the mathematics of making and using large sum calculations.

Integral and differential calculus symbols are often used in combination to express a quantity, thus  $\int dx$  means “the sum of all the little bits of  $x$ .” In other words, the whole quantity can be found by adding up all the indefinitely small little bits of  $x$ .

**Limits.**—In reality quantities must be finite or zero. In other words, we have something or we have nothing. This concept seems simple. The mathematician, however, has complicated the matter by devising two fictitious quantities, as it were, which are used to aid him in his reasoning processes. One is called “infinity,” and is greater than any number or quantity. The other is called “an infinitesimal” and is smaller than any number or quantity.

How do we arrive at these fictitious quantities of infinity and an infinitesimal? The answer to this question is found in the use of limits. A variable quantity, if it increases indefinitely in size, is said to reach infinity in the limit. Likewise, if a variable quantity decreases indefinitely in size it becomes an infinitesimal and is said to reach zero in the limit. In the precise language of the mathematician; *a variable is said to approach a limit when its value becomes and remains arbitrarily close to the limit.* “Arbitrarily close” means that we can assign a number as close as we please to the limit and the variable will ultimately become and remain closer to the limit than this arbitrary or assigned number.

If the variable  $x$  approaches *infinity* as the limit, the fact is stated mathematically as

$$\lim_{x \rightarrow \infty} x = \infty$$

This states in words that the limit of the variable  $x$  equals infinity as  $x$  approaches infinity.

On the other hand if the variable  $x$  approaches zero as the limit it is called an "infinitesimal." This means that the variable becomes and remains as close as you please to zero. In mathematical language,

$$\lim_{x \rightarrow 0} x = 0$$

This says in words that the limit of  $x$  equals zero as  $x$  approaches zero.

The quantity  $dx$  is known as an infinitesimal, because in the calculus process of differentiation it approaches zero as the limit. By this limiting method the calculus process becomes an exact process. For illustration, the ratio  $dy/dx$  pronounced "dee-wy by dee-ex" is made up of two differential quantities each of which approaches zero in the limit to give  $0/0$ , which as such cannot be evaluated. Here is where the mathematician's reasoning process with infinitesimals comes to the rescue. The value of  $y$  is related to the value of  $x$  so long as values can be assigned to either one. For illustration,  $y$  may always be twice the value of  $x$  no matter how small  $x$  is made. In this case the ratio is 2 right up to the limit  $0/0$ , so it is reasonable to believe the value of  $0/0$  for this case is 2. In other words, the indeterminate  $0/0$  is evaluated by this limiting process.

The idea of limits is often useful, as illustrated by the following mathematical statement:

$$\lim_{x \rightarrow 2} x^2 = 4$$

This states in words that the limit of the variable  $x^2$  equals 4 as  $x$  approaches 2. It is easy to see that  $x^2 = 2^2 = 4$  in the limit.

The differential sign  $d$  is closely related to the incremental sign  $\Delta$  (the Greek letter delta). The basic difference is that  $\Delta x$  stands for a finite increment of  $x$  while  $dx$  stands for an infinitesimal increment of  $x$ .

**Relative Smallness.**—Our calculations will deal with small quantities having various degrees of smallness. It is, therefore, important to know what degrees of smallness we can omit and still arrive at an answer with the required accuracy.

The size of a quantity depends upon the measuring stick. The earth is very small in comparison to our solar system, yet the earth is very large in comparison to a baseball. When dealing with the solar system, the earth should not be omitted, but the baseball could for most purposes be neglected. The earth, in this case, is said to have a first degree of smallness, while the baseball has a second degree of smallness. A flea on the baseball would then have a third degree of smallness.

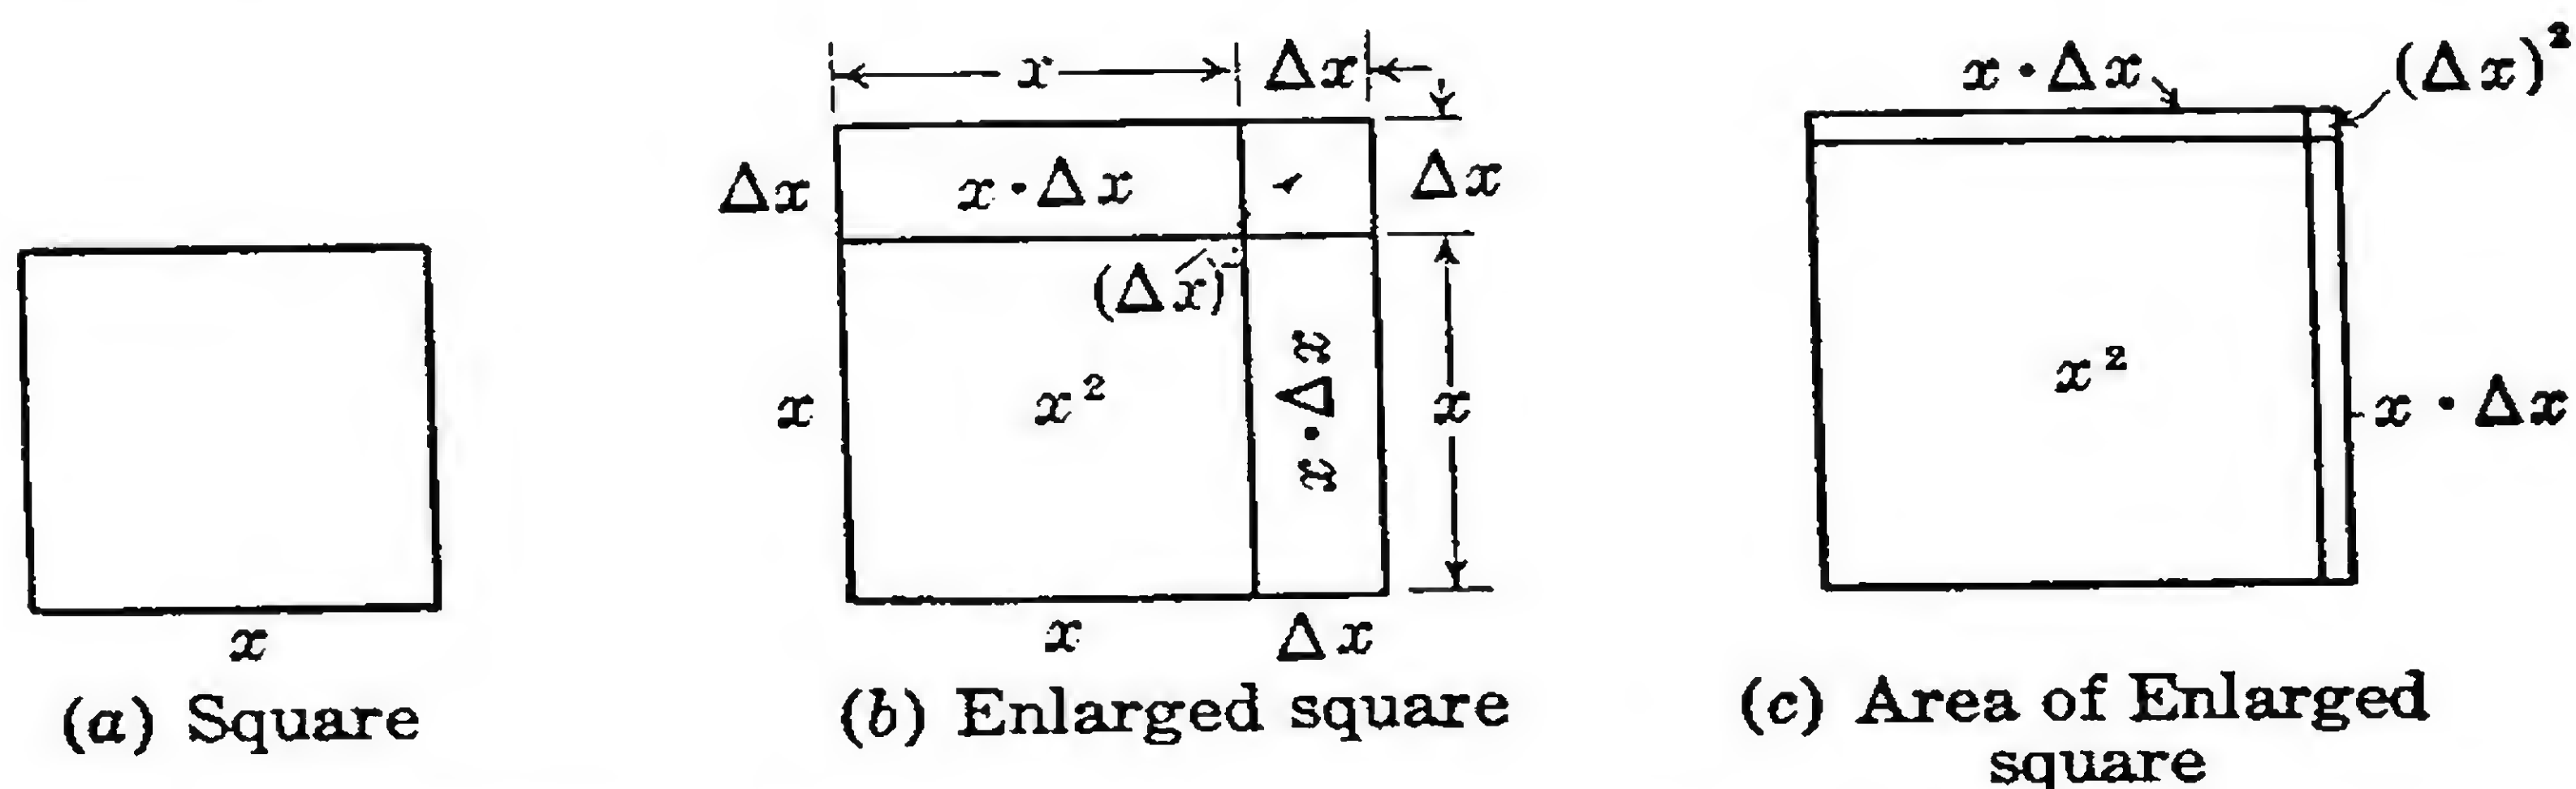

FIG. 61.—A square enlarged to show degrees of smallness.

The degree of smallness can be illustrated by enlarging the square of Fig. 61a. The area of this square is  $x \cdot x = x^2$ . If the square is enlarged by adding a strip having a width of  $\Delta x$  on the two sides as shown in Fig. 61b, then the total area is

$$(x + \Delta x)^2 = x^2 + 2x \cdot \Delta x + (\Delta x)^2 \quad (1)$$

To illustrate the geometry, let  $x = 5$  and  $\Delta x = 1$ , then the area of the original square is  $x \cdot x = 5 \cdot 5 = 25$  and the area of the enlarged square is  $(x + \Delta x)^2 = (5 + 1)^2 = 36$ . Adding the areas of the enlarged square of Fig. 61b gives  $x^2 = 5^2 = 25$ ,  $2(x \cdot \Delta x) = 2(5 \cdot 1) = 10$ , and  $(\Delta x)^2 = 1^2 = 1$ , thus

$$x^2 + 2x \cdot \Delta x + (\Delta x)^2 = 25 + 10 + 1 = 36,$$

which checks the above value.

Now if  $\Delta x$  is made very small in comparison to  $x$ , as shown in Fig. 61c, it is readily seen that  $(\Delta x)^2$  is of second order in smallness and can be omitted, thus

$$(x + \Delta x)^2 = x^2 + 2x \cdot \Delta x \quad (2)$$

with an accuracy of the first order. To illustrate, let  $x = 1,000$  and  $\Delta x = 1$ , then the area of the enlarged square by Eq. (1)

with accuracy to the second order is

$$(x + \Delta x)^2 = (1,001)^2 = 1,002,001$$

and by Eq. (2), the accuracy to the first order is

$$x^2 + 2x \Delta x = 1,000,000 + 2,000 = 1,002,000$$

By neglecting the second-order term  $(\Delta x)^2$ , the answer has changed approximately one part in a million. This makes it clear that if  $\Delta x$  is made small enough, by approaching the value of  $dx$ , the second, third, and higher order terms can be omitted.

**Rates.**—One of the most familiar illustrations of rate is the movement of an object which takes a certain amount of time. An automobile, for example, travels at a rate of 60 miles per hour. If the automobile has a uniform speed the whole distance,  $x = 60$  miles, and the total time,  $t = 1$  hr, can be used to express the rate mathematically, thus

$$\text{Rate} = \frac{x}{t} = \frac{\text{distance}}{\text{time}} \quad (3)$$

Using the above values, Eq. (3) gives

$$\text{Rate} = \frac{60 \text{ miles}}{1 \text{ hr}} = 60 \text{ mph}$$

Since it is unusual to have a constant rate of speed for such a long period of time, it is logical to look for a way to express this rate at any particular instant. By writing  $dx$  as an incremental distance corresponding to an incremental interval of time,  $dt$ , the rate at any instant can be expressed by

$$\text{Rate} = \frac{dx}{dt} \quad (4)$$

where  $dx$  = differential of  $x$ , pronounced “dee-ex.”

$dt$  = differential of  $t$ , pronounced “dee-tee.”

This equation states that the mathematical rate of  $x$  at the particular instant is the ratio of the differentials  $dx$  divided by  $dt$ . The differential of any variable quantity is indicated by writing the letter  $d$  before the quantity, thus in this equation the symbol  $dx$  is not the product of  $d$  and  $x$  but represents an incremental difference quantity. This difference quantity  $dx$  known as a differential corresponds to the distance covered during the corresponding incremental difference quantity  $dt$  the time

elapsed to cover that distance. Even though  $dx$  and  $dt$  are correspondingly very, very small quantities, the ratio will not be altered. This means that the automobile rate at any instant during the whole hour will be 60 miles per hour, since it has a uniform speed. However, if the automobile speed is not uniform, Eq. (3) cannot be used and resort must be made to Eq. (4), which is a simple differential calculus expression of rate. This

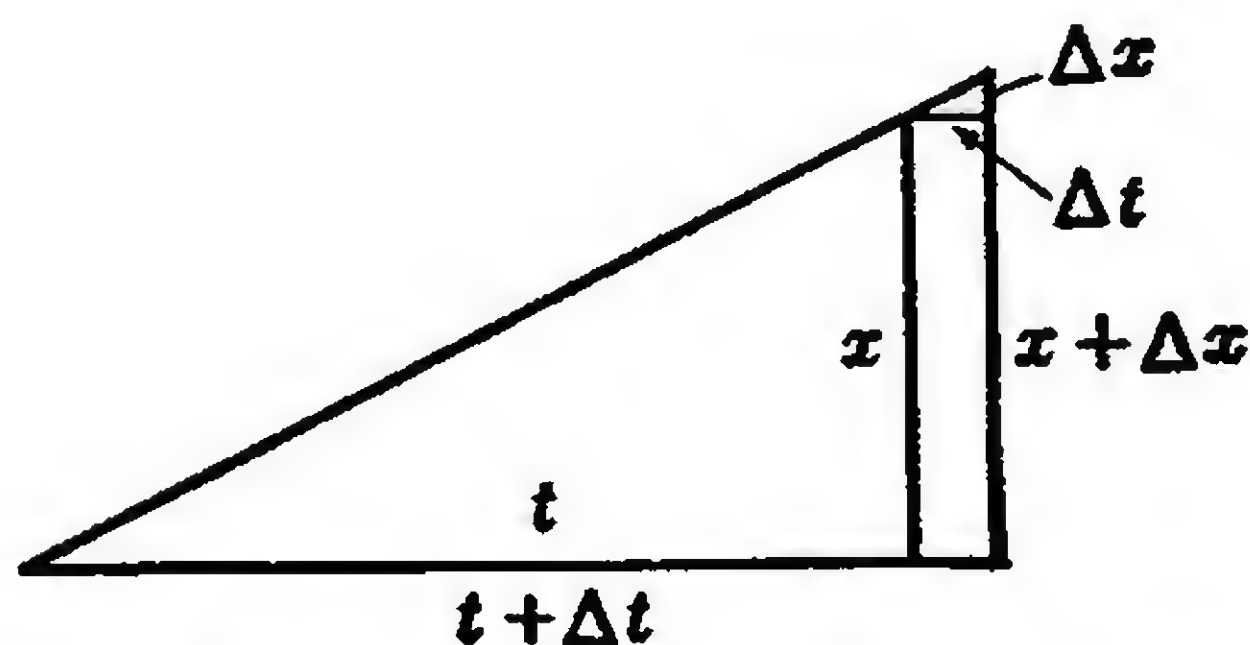

FIG. 62.—Triangle representation of a constant rate.

equation will hold true no matter how rapidly the rate or speed of the automobile is changing, because it considers such very, very small difference quantities. This is the heart of the calculus method, which makes it a most useful tool in expressing ideas and solving problems involving rates.

If the time  $t$  represents the base of a right triangle and the altitude is a measure of the distance  $x$  covered by the automobile from the beginning of the hour, as shown in Fig. 62, then the instantaneous rate at the end of an hour can be represented by the small similar triangle having a base of  $\Delta t$  and an altitude of  $\Delta x$ .

This triangle in Fig. 62 shows that as time  $t$  passes to become  $t + \Delta t$ , the distance grows from  $x$  to become  $x + \Delta x$ . In this

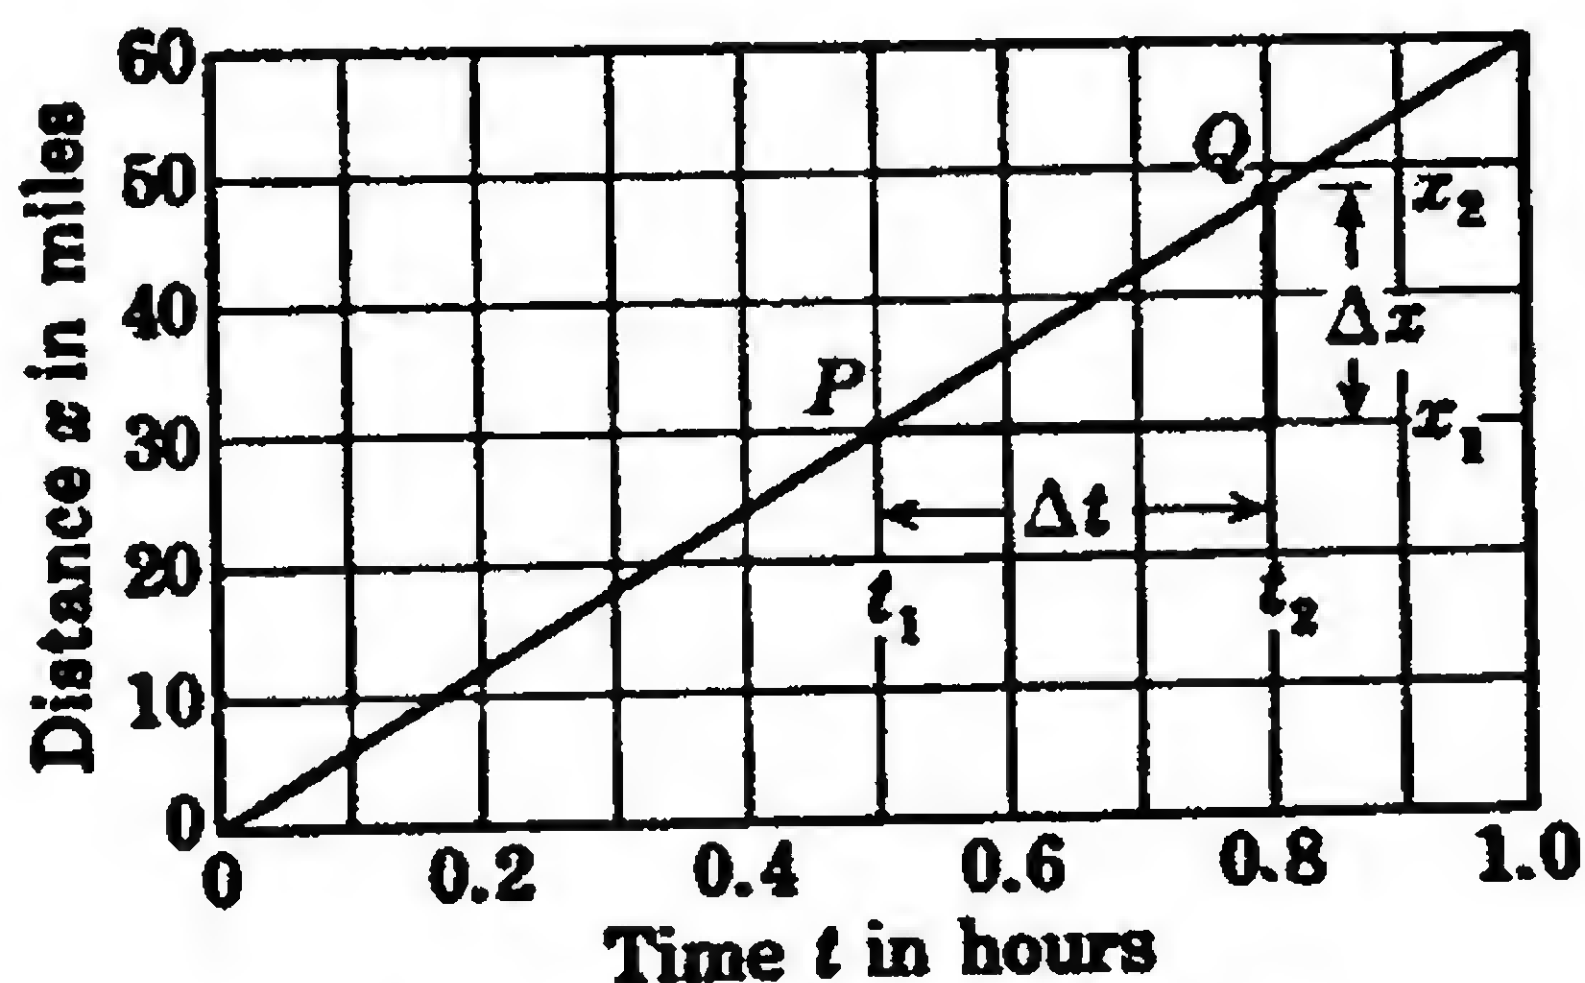

FIG. 63.—A constant-slope curve.

case, the distance  $x$  depends upon the time  $t$  and the small distance  $\Delta x$  depends upon the small time  $\Delta t$ . An important thing to note is that the ratio still has a definite value even though both  $\Delta x$  and  $\Delta t$  become indefinitely small.

**Slopes.**—Differentiation is the process of finding or calculating differentials of variables. This can be accomplished graphically

by plotting the curve of the variable and then determining the slope of the curve. Consider the above illustration of an automobile traveling 60 miles per hour. This information if plotted will give the straight line curve shown in Fig. 63. By substituting in Eq. (3), the slope of this curve is found to be 60 miles per hour. Now, instead of considering all of the graph, use the portion of the curve between points  $P$  and  $Q$ . The slope of this portion of the curve is the change in distance  $\Delta x = x_2 - x_1$  divided by the corresponding change in time  $\Delta t = t_2 - t_1$ , or, in equation form,

$$\text{Slope} = \frac{\Delta x}{\Delta t} = \frac{x_2 - x_1}{t_2 - t_1} \quad (5)$$

where  $\Delta x$  = the change in  $x$ , pronounced "delta ex."

$\Delta t$  = the change in  $t$ , pronounced "delta tee."

If the values on the curve are substituted in Eq. (5), the result is

$$\text{Slope} = \frac{48 - 30}{0.8 - 0.5} = \frac{18}{0.3} = 60 \text{ mph}$$

This checks with the solution obtained by using Eq. (3) for the whole curve.

If the quantity  $\Delta x$  is made smaller and smaller, it can be made to approach the differential  $dx$ . Similarly  $\Delta t$  can be made to approach the differential  $dt$ . For illustration move the point  $Q$  closer and closer to the point  $P$  and the triangle will become smaller and smaller with the result that the slope or rate at the point  $P$  can be expressed in differential form by Eq. (4). This reveals that there are two types of rates, an average rate which is computed over a definite interval, such as from  $P$  to  $Q$  in the above illustration, and an instantaneous rate which is computed at one particular point such as  $P$  in the above illustration.

For a curve that is not a straight line the ratio of  $\Delta x$  to  $\Delta t$  as illustrated in Fig. 63 will not always give the slope at the point  $P$ . The slope of the curve, at the point  $P$ , is called the "tangent" to the curve. Hence, to find the derivative  $dx$  by  $dt$  at the point  $P$ , draw a tangent to the curve at that point and find the slope of this tangent.

$$\text{Slope} = \text{tangent} = \text{derivative}$$

The slope can also be expressed in terms of the limiting process as follows:

$$\text{Slope} = \lim_{\Delta t \rightarrow 0} \frac{\Delta x}{\Delta t} = \frac{dx}{dt} \quad (6)$$

This says in words that the limit of the ratio of delta  $x$  to delta  $t$  as delta  $t$  approaches zero is the ratio of the differential of  $x$  to the differential of  $t$ .

Consider any curve such as the one shown in Fig. 64. Select any two points on the curve such as  $P$  and  $Q$ . The slope of the line joining these two points is the ratio  $\Delta y/\Delta x$  as shown in the

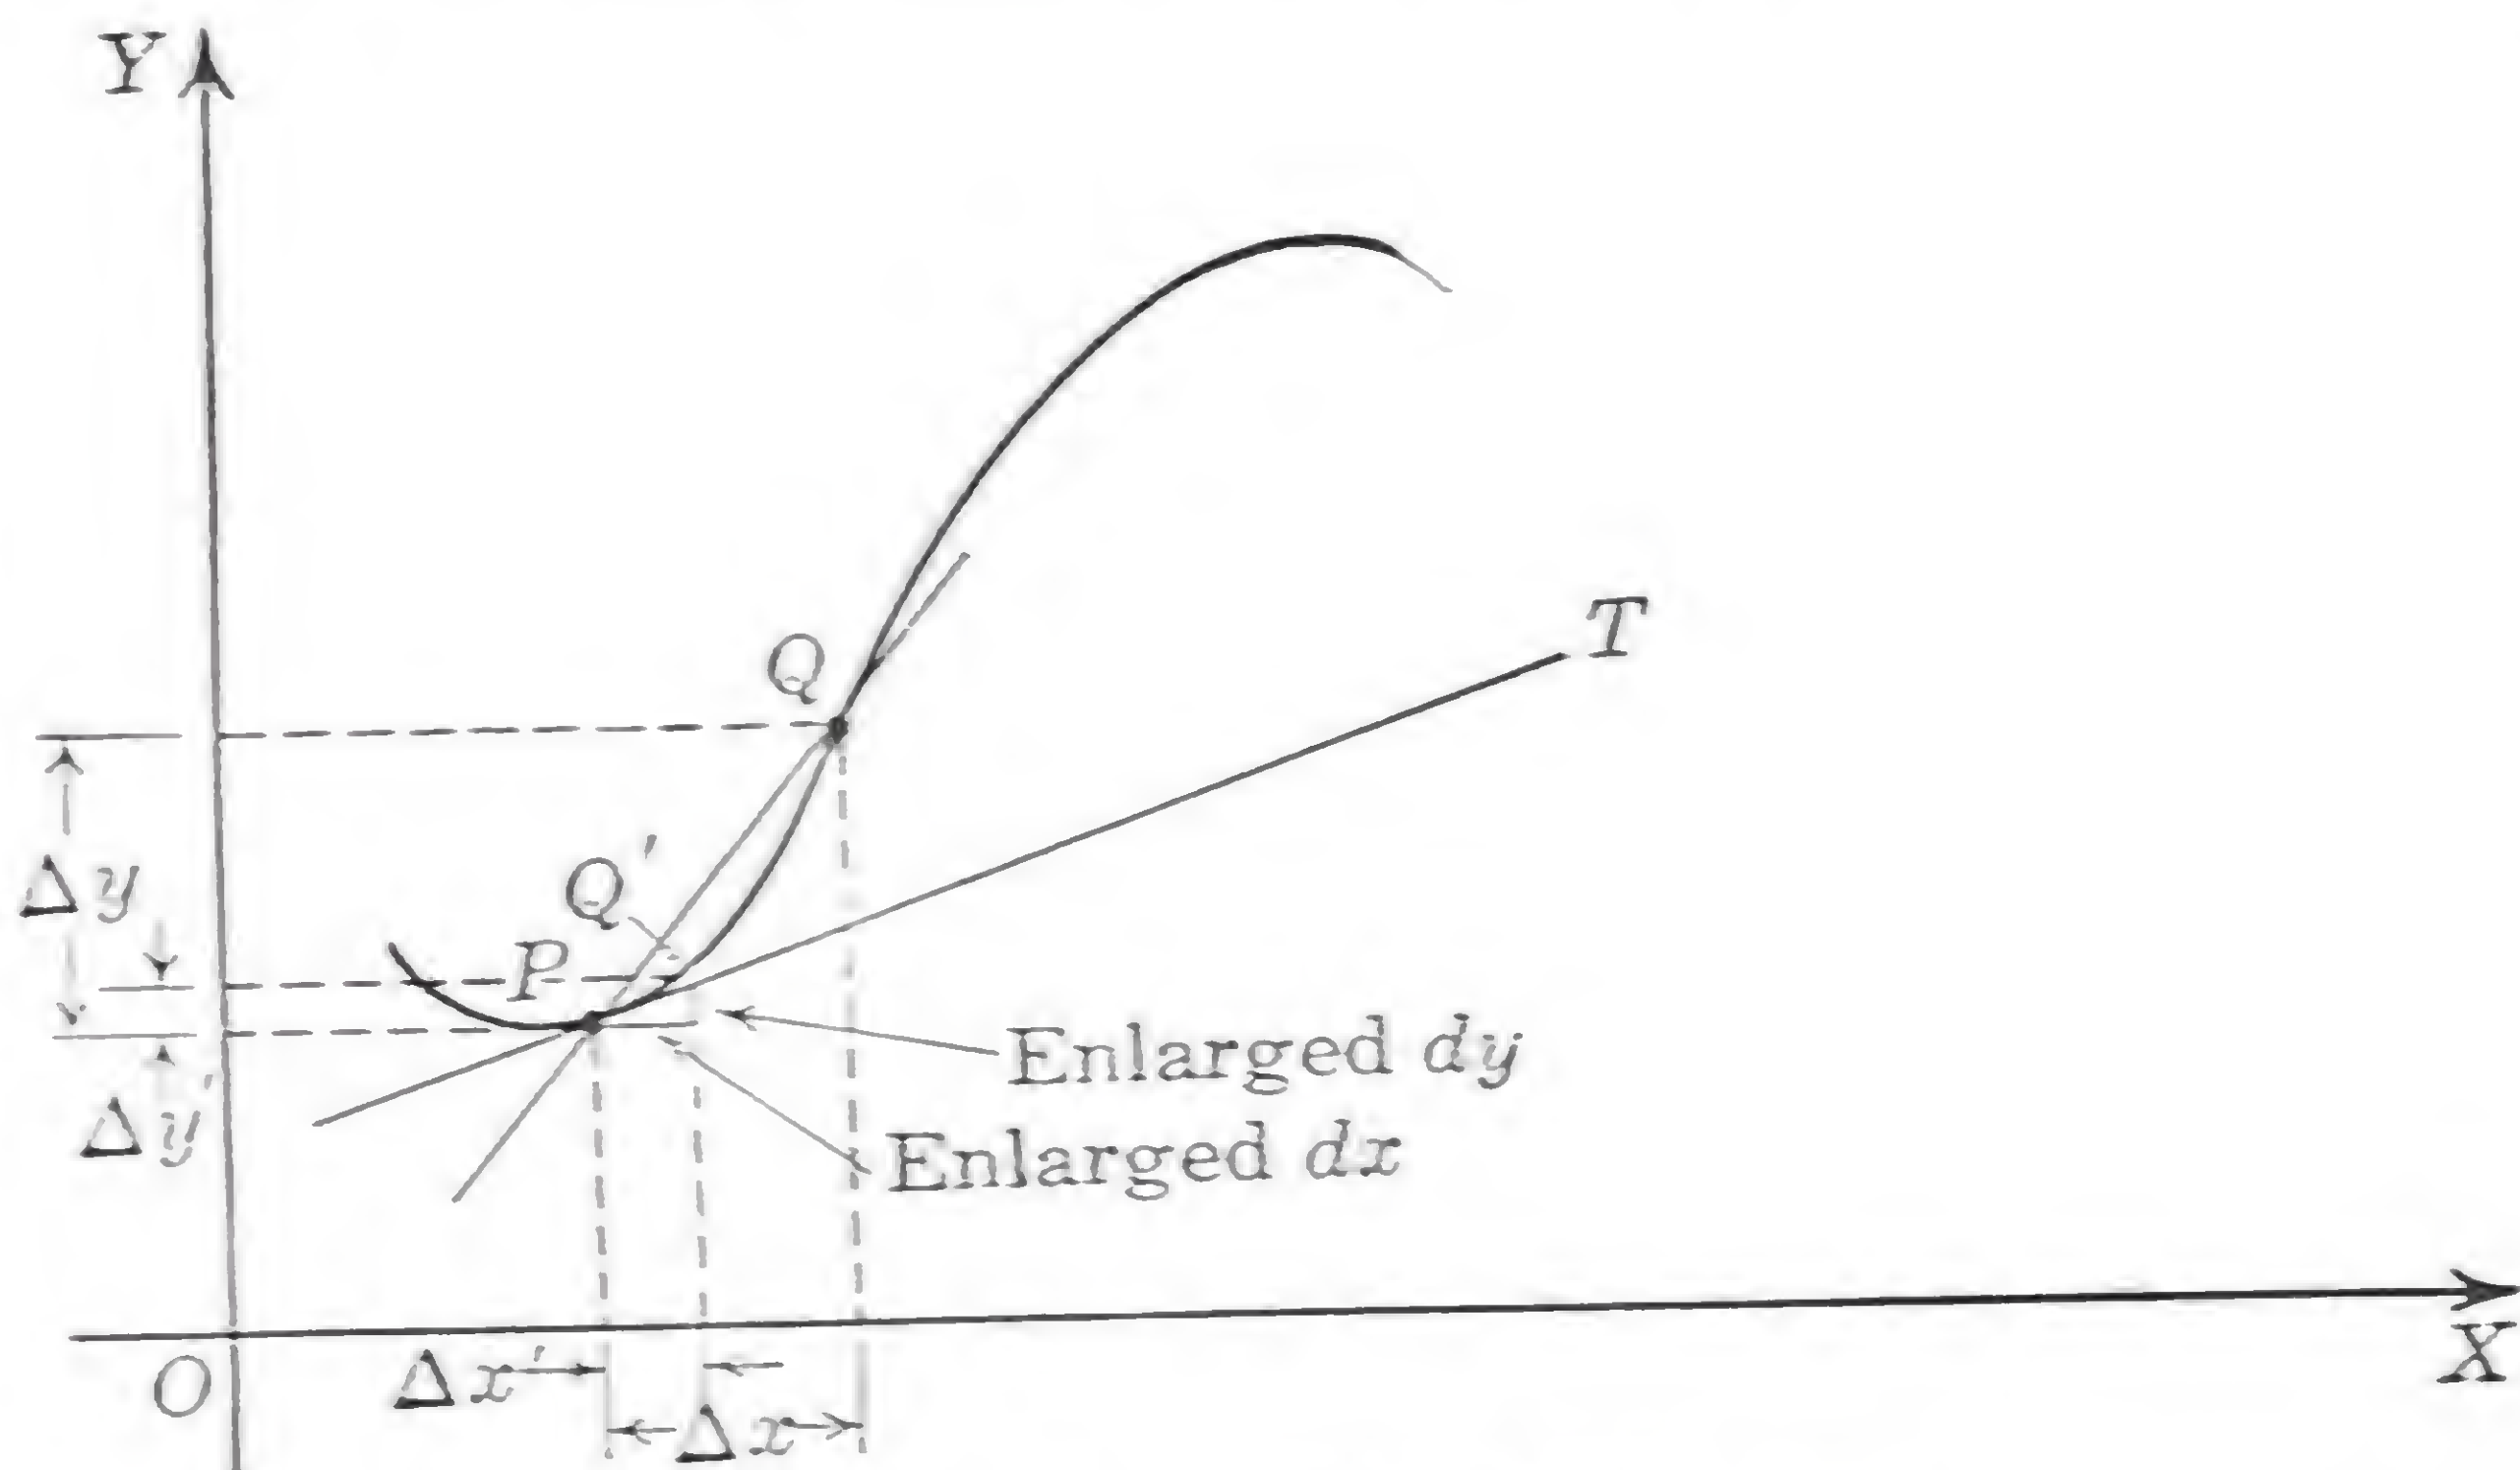

FIG. 64.—A variable-slope curve.

figure. It will be noted, however, that this line is not tangent to the curve at either point  $P$  or point  $Q$ . Now move the point  $Q$  down to  $Q'$ , which is a step in the process of making  $\Delta x \rightarrow 0$ . The slope of the line joining  $P$  and  $Q'$  is now  $\Delta y'/\Delta x'$ , which is approaching the slope of the tangent to the curve marked  $PT$ . As the point  $Q$  is moved closer and closer to the point  $P$ , the slope of the line joining the two points will approach the tangent. In the limit it will equal the tangent to the curve at point  $P$ . The slope of the curve at point  $P$  is then  $dy/dx$ .

*Example 1.* A diode vacuum tube obeys the square law curve  $i = e^2$  as shown in Fig. 65. Determine the slope of the curve at point  $P$  when the voltage is 5 volts and the current is 25 ma.

*Solution.* Draw the straight line  $ab$  tangent to the curve and through the point  $P$ . The slope of this straight line by Eq. (3) is

$$\text{Slope} = \frac{50 - 5}{7.5 - 3} = \frac{45}{4.5} = 10$$

measured in milliamperes per volt. *Ans.*

**Functions.**—When two variables are related in such a way that if the value of the first variable is furnished, it is possible to determine the value of the second variable, then the first variable

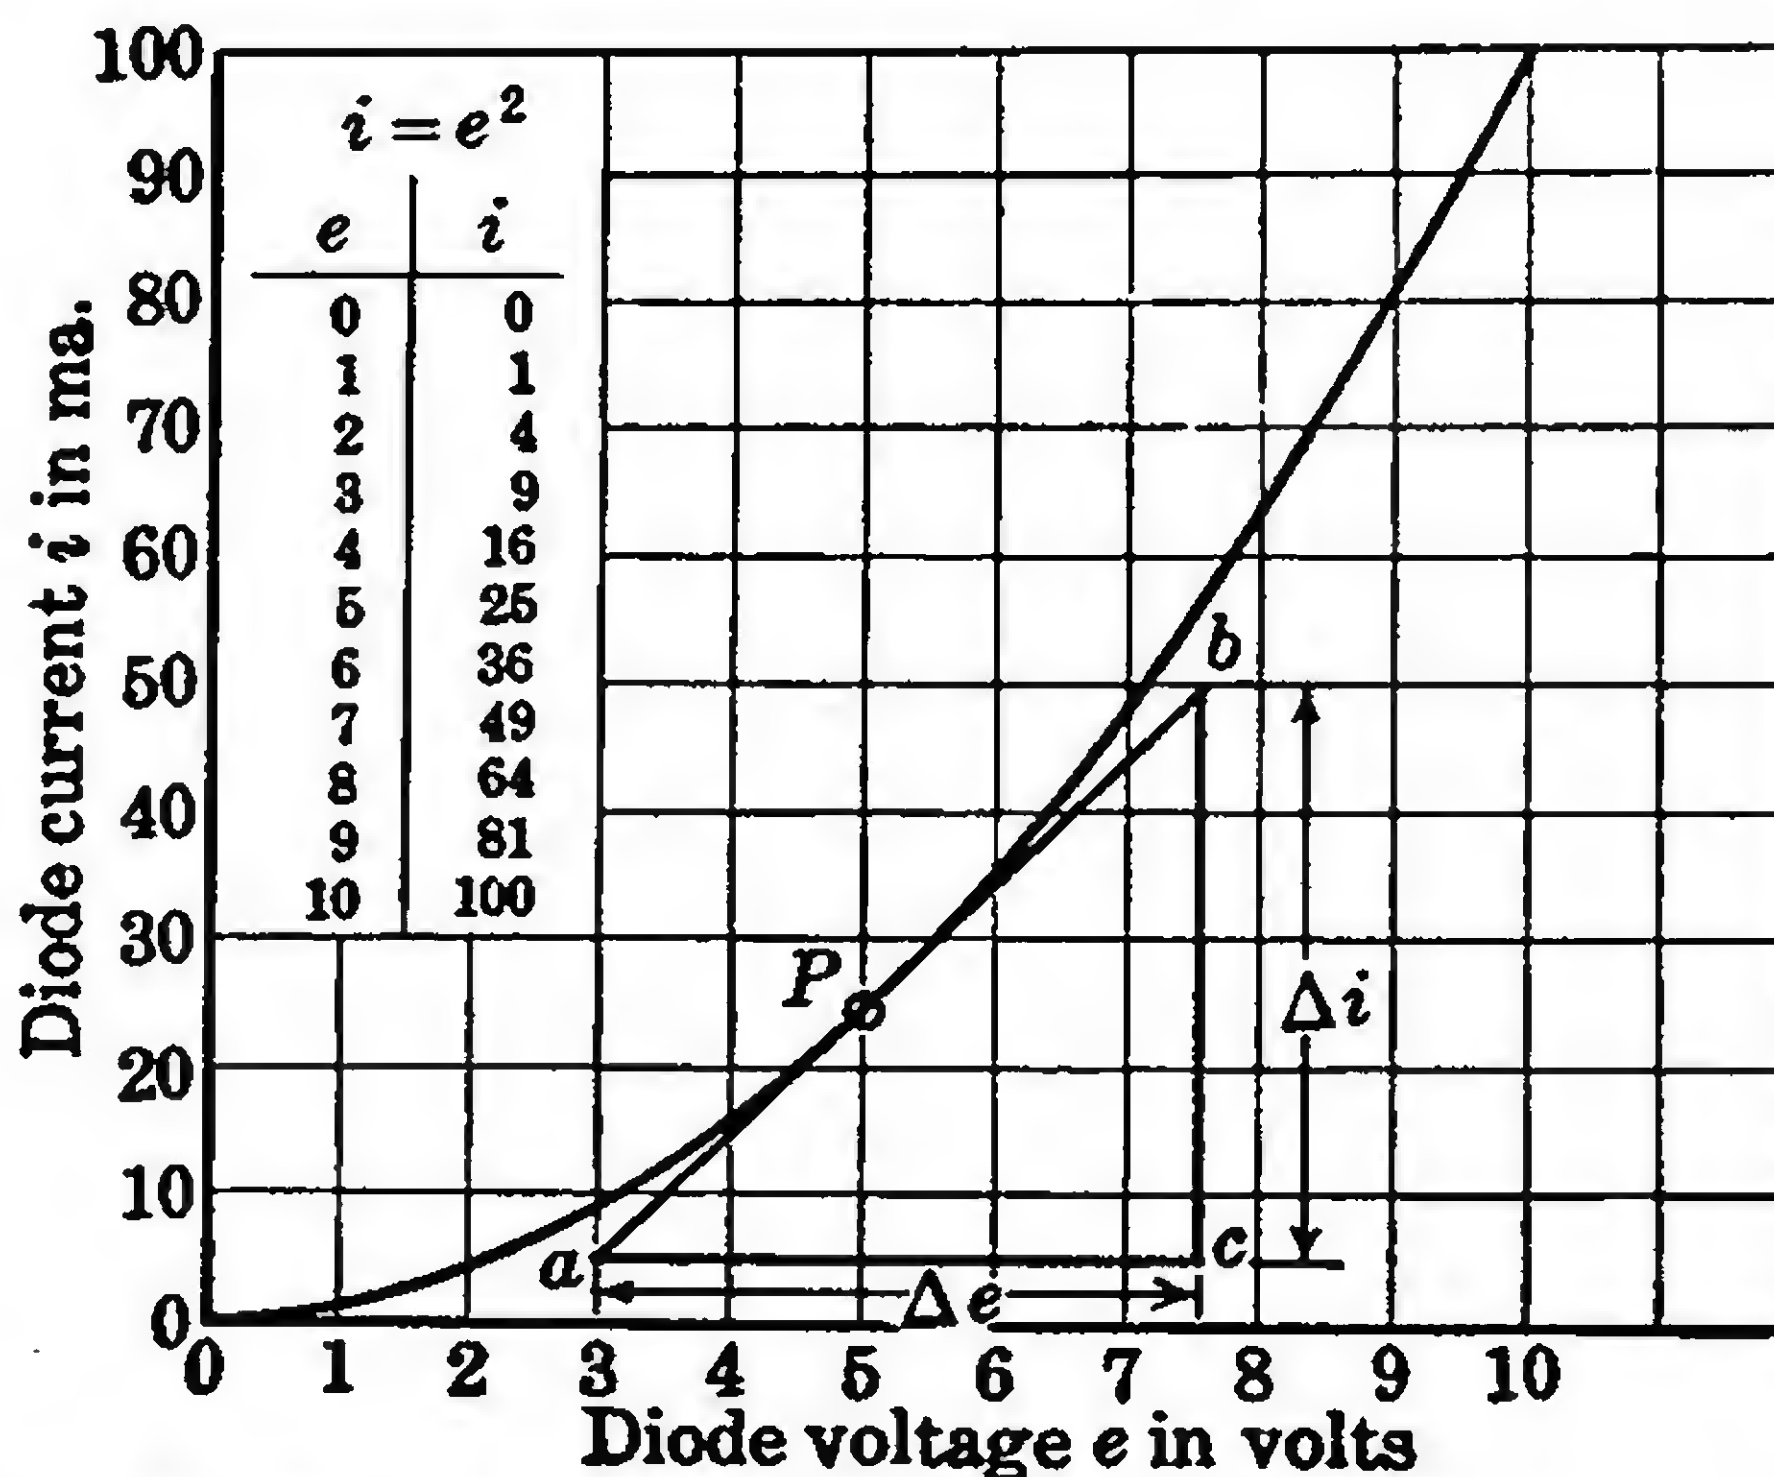

FIG. 65.—The square law curve of a diode vacuum tube.

is said to be a “function” of the second. In the diode vacuum tube of Example 1, it is possible to determine the voltage  $e$  if the current is known, hence  $i$  is a function of  $e$ . In this example, the voltage  $e$  can be applied at will; hence it is known as the “independent variable” while the current  $i$  depends upon the voltage  $e$  that is applied and is called the “dependent variable” or “function.” To make this statement mathematically,

$$i = f(e) \quad (7)$$

This equation states that  $i$  is a function of  $e$ . It does not mean that  $f$  is multiplied by  $(e)$ , but that if  $e$  is known, it is possible to determine the dependent variable  $i$ . Substituting the value of  $f(e) = e^2$  from Fig. 65 gives the exact

expression from which  $i$  can be determined if  $e$  is given, that is,

$$i = e^2$$

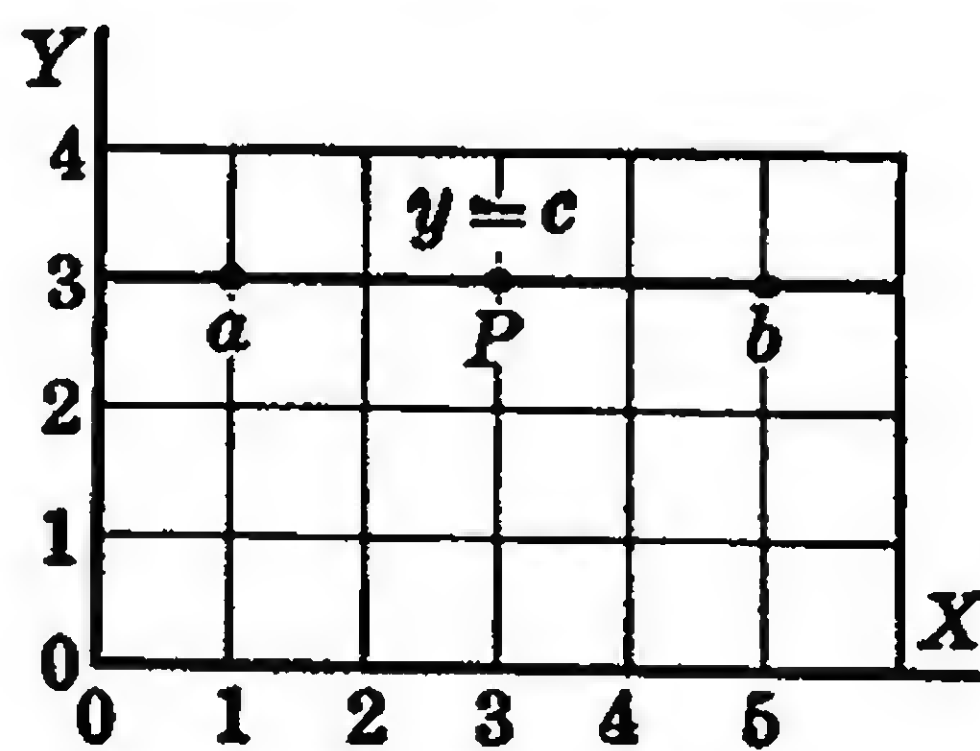

FIG. 66.—Here  $y = c$ , a constant.

**Derivative of a Constant.**—As shown in Fig. 66, when  $y$  is equal to a constant, which does not change in value, it has no rate or differential. The slope is zero because if the line  $ab$  is drawn

through the point  $P$  tangent to the curve the slope is given by Eq. (5), thus

$$\text{Slope} = \frac{y_2 - y_1}{x_2 - x_1} = \frac{3 - 3}{5 - 1} = \frac{0}{4} = 0$$

Therefore, for the equation  $y = c$ , the differential of a constant is zero, thus

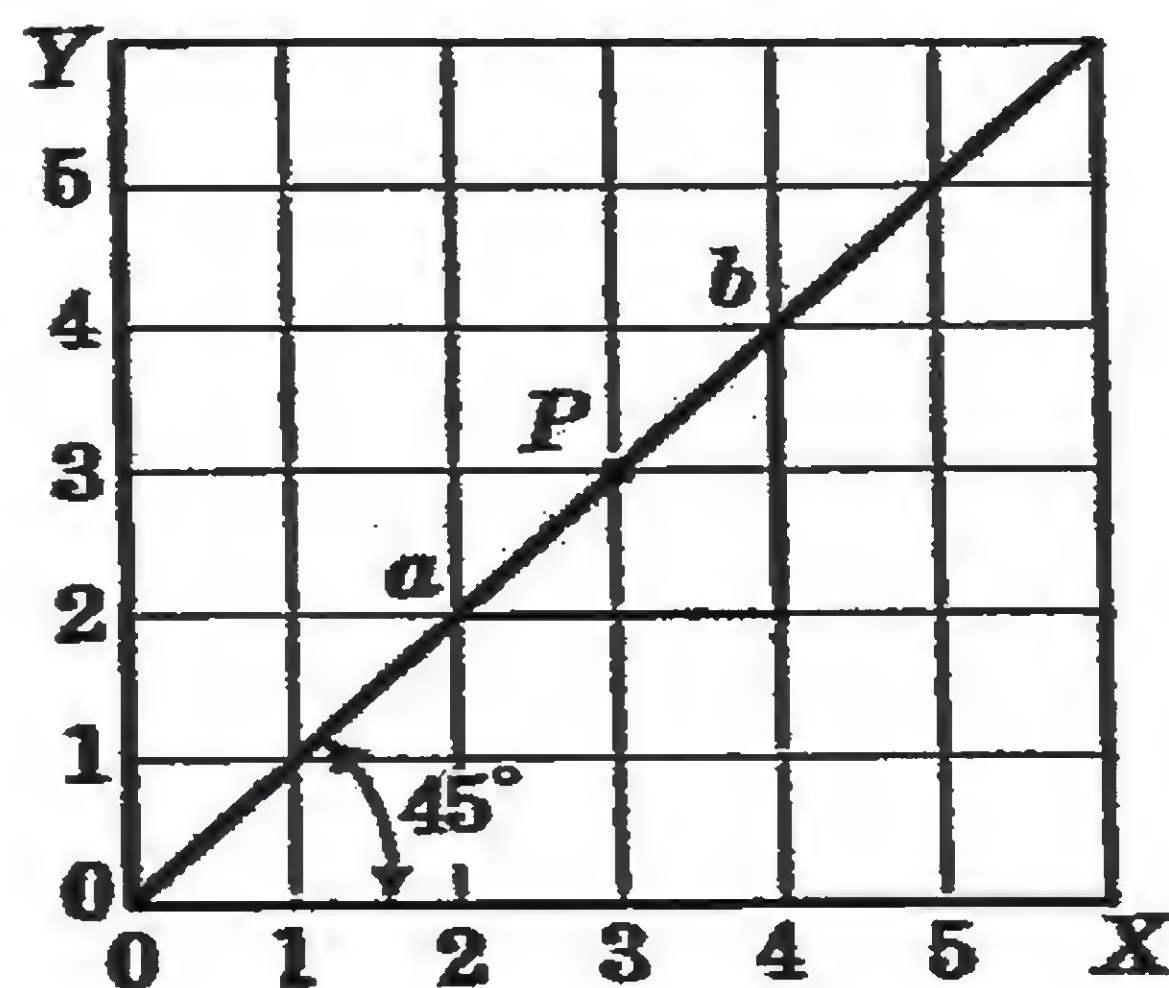

$$dy = dc = 0 \quad (8)$$

and the derivative of a constant is zero, thus

$$(I) \quad \frac{dy}{dx} = \frac{dc}{dx} = 0 \quad (9)$$

This merely states that the slope of a horizontal line is zero. Since there is no change in  $y$  as  $x$  varies, there is no change in  $dy$  for the change  $dx$ .

**Derivative of a Variable with Respect to Itself.**—When

$y = x$  as shown in Fig. 67 the slope at point  $P$  by Eq. (5) is

$$\text{Slope} = \frac{\Delta y}{\Delta x} = \frac{4 - 2}{4 - 2} = \frac{2}{2} = 1$$

For this curve  $dy = dx$ , hence the derivative

$$(II) \quad \frac{dy}{dx} = \frac{dx}{dx} = 1 \quad (10)$$

FIG. 67.—Here  $y = x$ , a variable.

This equation states that when the  $x$  and  $y$  scales are alike the slope of a line making an angle of 45 degrees with the  $x$ -axis is unity.

**Derivative of a Variable Multiplied by a Constant.**—In the equation  $y = cx$  let the value of  $y$  and  $x$  increase by an increment, thus

$$\begin{array}{rcl} y + \Delta y & = & cx + c \Delta x \\ y & = & cx \\ \hline \Delta y & = & c \Delta x \end{array}$$

Subtracting  
gives

Dividing through by  $\Delta x$ , the slope is a constant.

$$\frac{\Delta y}{\Delta x} = c$$

Now, if the limit of this fraction is taken, the derivative form can be obtained, thus

$$(III) \quad \lim_{\Delta x \rightarrow 0} \frac{\Delta y}{\Delta x} = \frac{dy}{dx} = c \quad (11)$$

This equation states that the derivative of a variable multiplied by a constant is equal to the constant multiplied by the derivative of the variable. Referring to Fig. 68, the derivative or slope of the line  $y = 0$  is  $dy/dx = 0$ , of the line  $y = 0.5x$  is  $dy/dx = 0.5$ , of the line  $y = x$  is  $dy/dx = 1$ , of the line  $y = 2x$  is  $dy/dx = 2$  and of the line  $y = \infty x$ ,  $dy/dx = \infty$ . In other words, the derivative is the slope of the line which is the coefficient or constant multiplied by the variable.

The above method of adding an increment to each variable, subtracting the original function, and then taking the limit of the increment is the *basic method* for finding the derivative of a function. For practical purposes this procedure can be simplified by using differential quantities at the beginning instead of incremental quantities. Applying this idea, the above derivation is as follows:

Let the value of  $y$  and  $x$  increase by differential amounts, thus

$$\begin{array}{rcl} y + dy & = & cx + c dx \\ \text{Subtracting the original function } y & & = cx \\ \hline \text{Then the differential} & & dy = c dx \end{array}$$

$$\text{and the derivative} \quad \frac{dy}{dx} = c$$

This checks the above solution.

**Example 2.** State the derivative of the function

$$y = -2x$$

$$\text{Solution. } \frac{dy}{dx} = \frac{d(-2x)}{dx} = -2 \frac{dx}{dx} = -2. \quad \text{Ans.}$$

**Derivative of a Variable with a Constant Exponent.**—When  $y = x^2$ , a curve similar to the one in Fig. 65 results. The thing to remember is that as  $x$  increases,  $x^2$  increases more rapidly, and

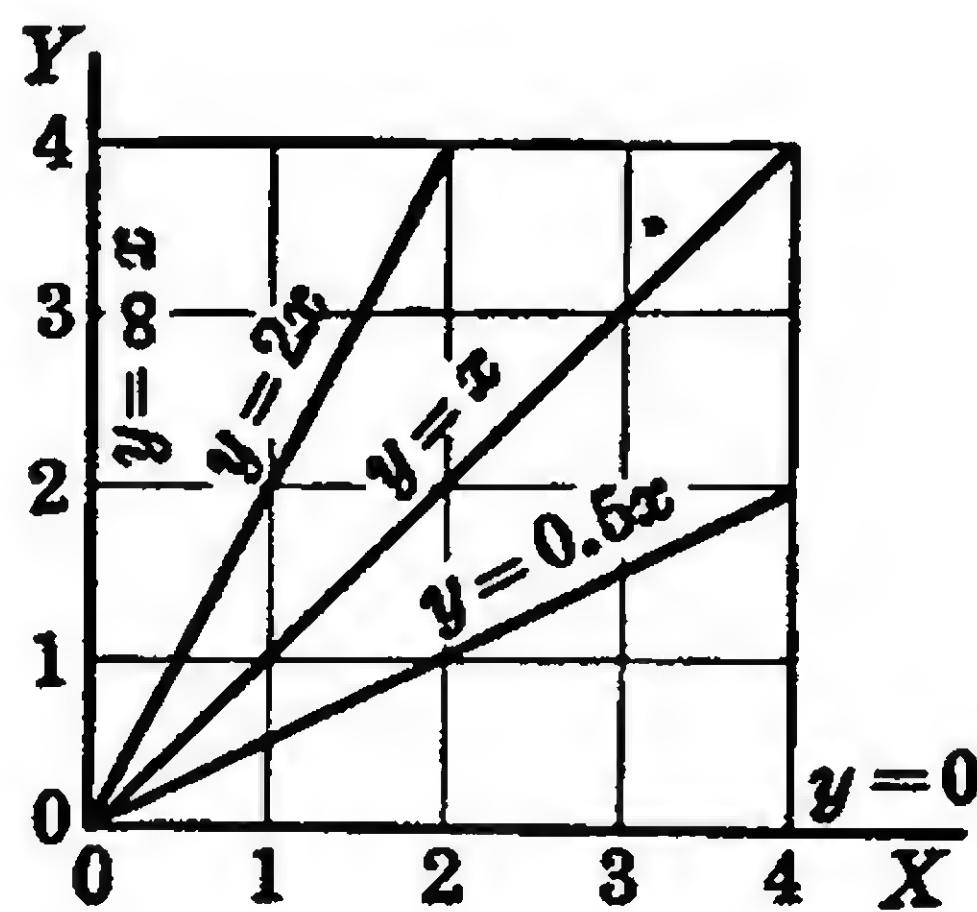

FIG. 68.—Here  $y = cx$ , curves of various constants multiplied by a variable.

hence  $y$  also increases more rapidly since it is equal to  $x^2$ . In Example 1, the slope of the curve at point  $P$  was found to be 10. At any other point it will not be this value, as was the case for a straight line, so it is desired to determine the value of  $dy/dx$ . This can be done very simply as follows: To the value of  $x$ , add a little bit to make it  $x + dx$ , and to  $y$  add a little bit to make it  $y + dy$ . Substituting these values in the above equation gives

$$y + dy = (x + dx)^2$$

Squaring the right-hand side gives

$$y + dy = x^2 + 2x dx + (dx)^2$$

Since  $(dx)^2$  is a little bit of a little bit, it is of second order in smallness and can be neglected. Leaving this term out and subtracting the original equation  $y = x^2$  results in

$$\begin{array}{r} y + dy = x^2 + 2x dx \\ y \qquad \qquad = x^2 \\ \hline dy = \qquad \qquad 2x dx \end{array}$$

or dividing both sides by  $dx$  gives the desired derivative

$$\frac{dy}{dx} = \frac{d(x^2)}{dx} = 2x \quad (12)$$

This analytical method is a basic procedure for finding the derivative of a function.

*Example 3.* Determine the derivative of the curve at point  $P$  in Fig. 65.

*Solution.* Applying Eq. (12),

$$\frac{di}{de} = 2e = 2 \cdot 5 = 10 \quad \text{Ans.}$$

This checks the graphical solution of Example 1.

As another illustration let  $y = x^3$ . Then, as before, let both  $y$  and  $x$  increase a little bit to give

$$\begin{aligned} y + dy &= (x + dx)^3 \\ &= x^3 + 3x^2 dx + 3x(dx)^2 + (dx)^3 \end{aligned}$$

subtracting the original equation and neglecting the terms of second or higher order of smallness give

$$dy = 3x^2 dx$$

$$\frac{dy}{dx} = \frac{d(x^3)}{dx} = 3x^2 \quad (13)$$

From Eqs. (10), (12), and (13), the following table can be made:

$y$	$\frac{dy}{dx}$
$x^1$	$1x^0$
$x^2$	$2x^1$
$x^3$	$3x^2$

This table shows a sequence which would lead us to guess that the derivative of  $x^4$  is  $4x^3$ . To check this, differentiate the equation  $y = x^4$  as shown above by adding a little bit of  $y$  and a little bit of  $x$  to get

$$y + dy = (x + dx)^4 = x^4 + 4x^3 dx + 6x^2(dx)^2 + 4x(dx)^3 + (dx)^4$$

Neglecting second or higher order terms and subtracting the original equation gives

$$dy = 4x^3 dx$$

$$\text{or, in derivative form, } \frac{dy}{dx} = \frac{d(x^4)}{dx} = 4x^3 \quad (14)$$

Generalizing this procedure, let  $n$  be the exponent of  $x$ . Then the derivative must have  $n$  multiplied by  $x$  and the new exponent will be one less than  $n$ , thus

$$(IV) \quad \frac{dy}{dx} = \frac{d(x^n)}{dx} = nx^{n-1} \quad (15)$$

*Example 4.* Find the derivative of  $y = x^7$ .

*Solution.* Applying Eq. (15)  $\frac{dy}{dx} = 7x^6$ . *Ans.*

This rule applies as well to negative and fractional powers, as shown in the following examples:

*Example 5.* Find the derivative of  $y = x^{-2}$ .

*Solution.* Applying Eq. (15)  $\frac{dy}{dx} = -2x^{-3}$ . *Ans.*

*Example 6.* Find the derivative of  $y = \sqrt{x} = x^{1/2}$ .

*Solution.* Applying Eq. (15)  $\frac{dy}{dx} = \frac{1}{2} x^{-1/2} = \frac{1}{2\sqrt{x}}$ . *Ans.*

**Derivative of a Sum.**—Let  $y = u + v$  and, by the basic procedure, let these variables grow to give

$$y + dy = u + du + v + dv$$

Subtracting the original function,  
tion,

$$\text{Hence the differential of } y \text{ is } \frac{y}{dy} = \frac{u}{du} + \frac{v}{dv} \quad (16)$$

Dividing both sides of the equation by  $dx$  gives the derivative

$$(V) \quad \frac{dy}{dx} = \frac{d(u + v)}{dx} = \frac{du}{dx} + \frac{dv}{dx} \quad (17)$$

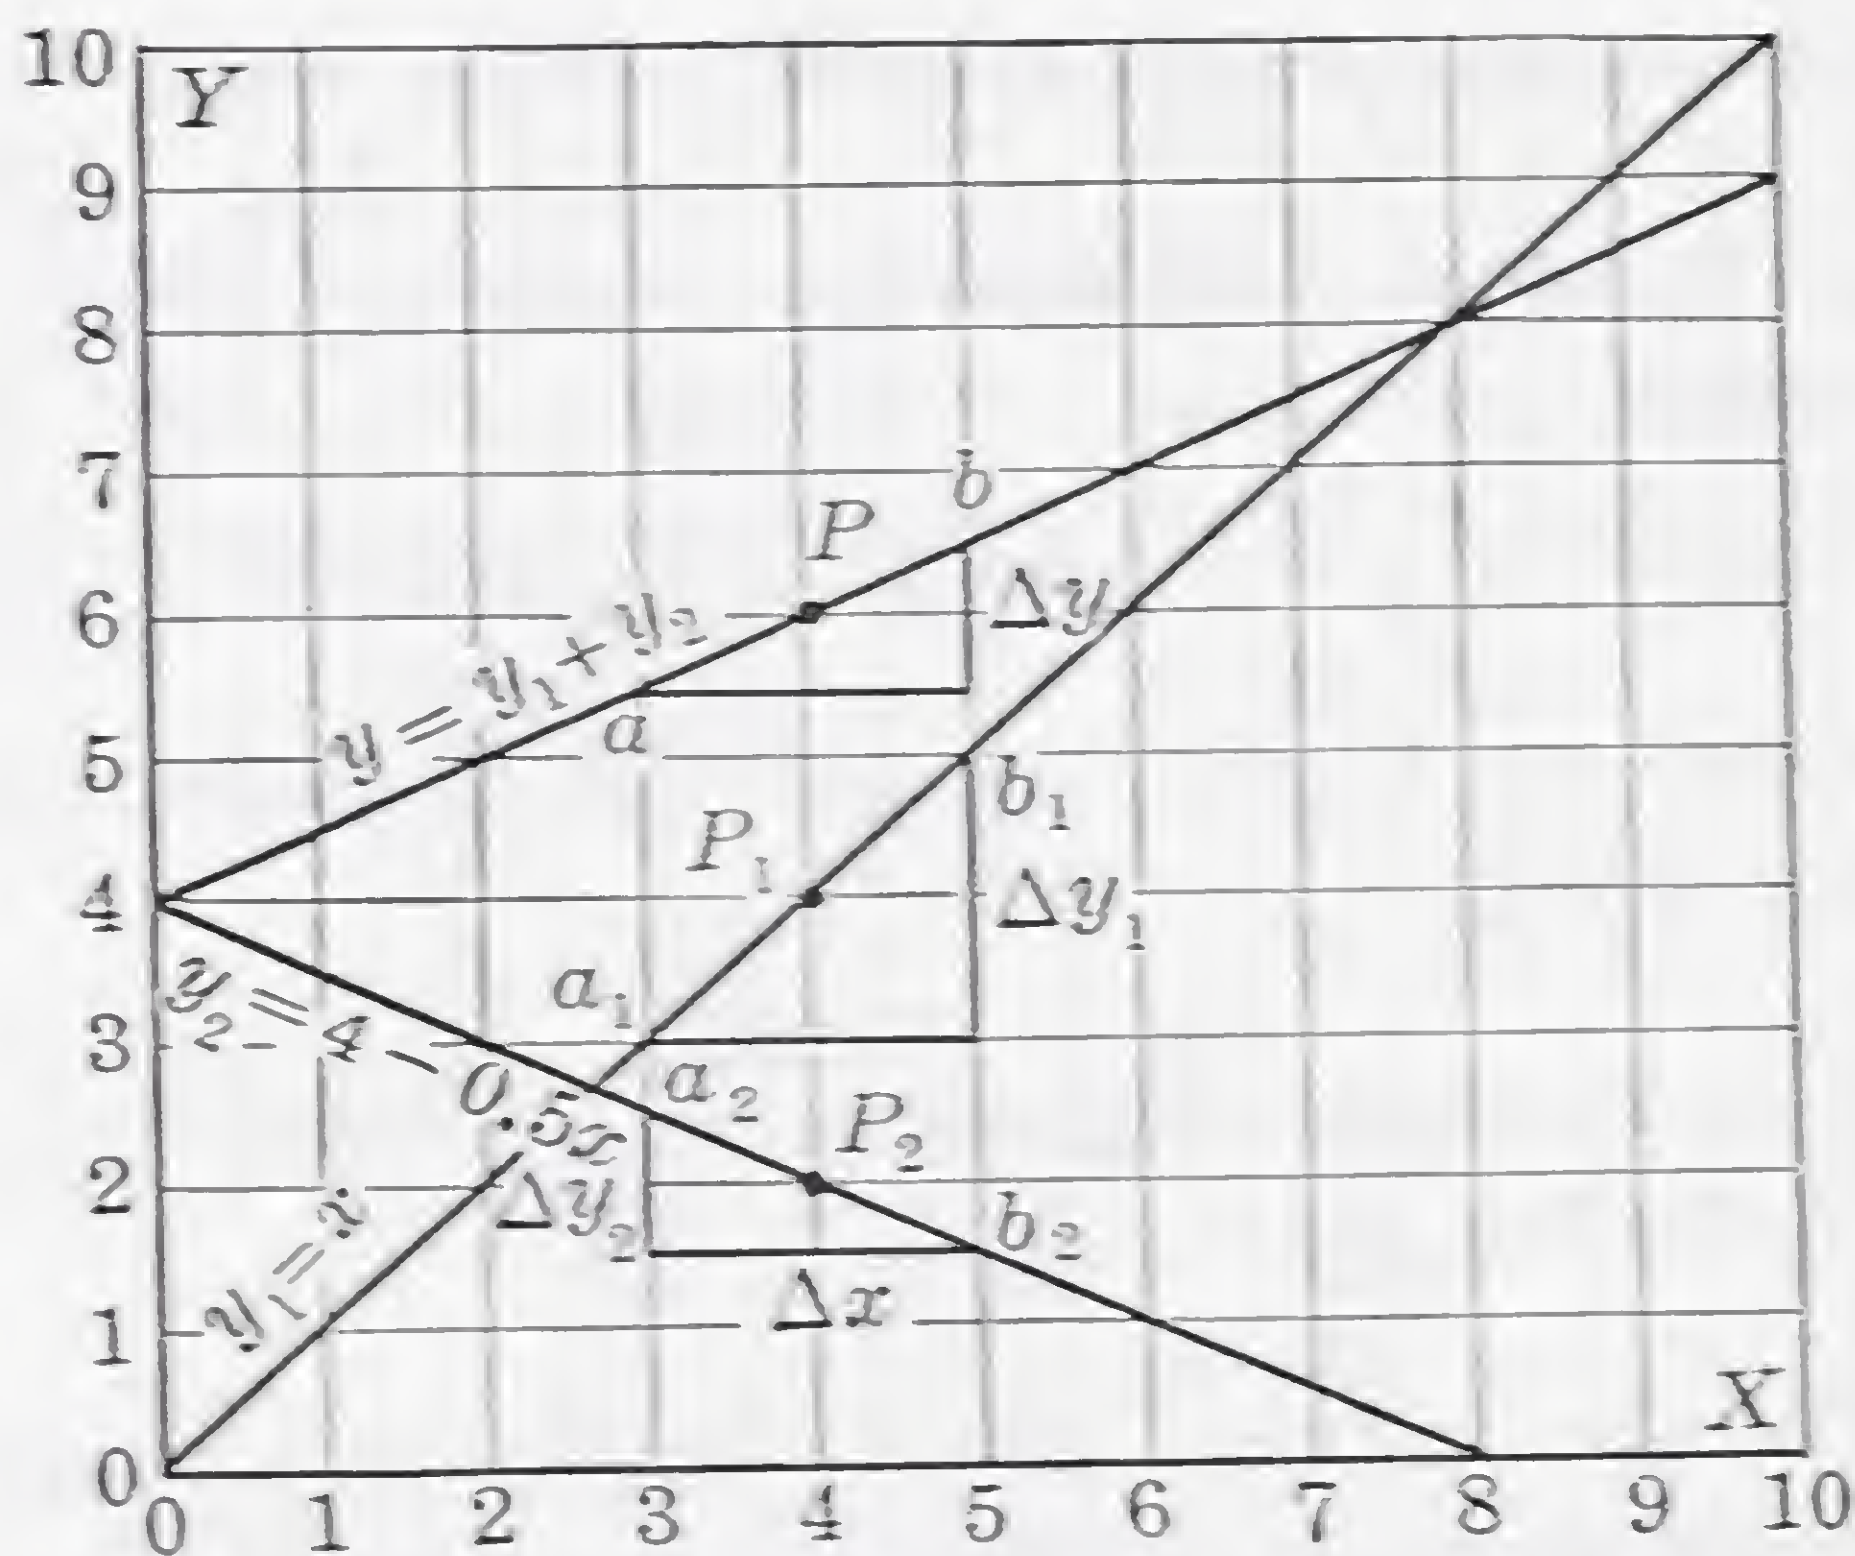

FIG. 69.—Here  $y = y_1 + y_2$ , a sum.

**Example 7.** Find the derivative of the sum of  $y_1 = x$  and  $y_2 = 4 - 0.5x$  both analytically and graphically.

**Solution.**  $y = y_1 + y_2 = x + 4 - 0.5x$

$$\text{By Eq. (17)} \quad \frac{dy}{dx} = \frac{dx}{dx} + \frac{d(4)}{dx} - \frac{d(0.5x)}{dx} = 1 + 0 - 0.5 = 0.5 \quad \text{Ans.}$$

Referring to Fig. 69,

$$\frac{\Delta y_1}{\Delta x} = \frac{5 - 3}{5 - 3} = \frac{2}{2} = 1$$

$$\frac{\Delta y_2}{\Delta x} = \frac{1.5 - 2.5}{5 - 3} = \frac{-1}{2} = -0.5$$

$$\text{Then} \quad \frac{\Delta y}{\Delta x} = \frac{\Delta y_1}{\Delta x} + \frac{\Delta y_2}{\Delta x} = 1 - 0.5 = 0.5 \quad \text{Ans.}$$

Solving for the slope,

$$\frac{\Delta y}{\Delta x} = \frac{6.5 - 5.5}{5 - 3} = 0.5 \quad \text{Check.}$$

lines because it holds for any curve. However, for any curve, it is possible to draw a tangent to the curve at the point of interest and then find the slope of the tangent to get the derivative for that point. If this is done, it will be found that the curve resulting from the sum of the other variables has the same slope as the sum of the slopes of the various variables. This is another way of stating Eq. (17).

**Derivative of a Product.**—Let  $y = uv$  and as each variable grows

$$\begin{aligned} y + dy &= (u + du)(v + dv) \\ &= uv + u dv + v du + du dv \end{aligned}$$

Subtracting the func-

$$\begin{array}{rcl} \text{tion,} & y & = uv \\ \text{The differential of } y \text{ is} & \frac{dy}{du dv + v du} & = \end{array} \quad (18)$$

The product  $du dv$  was omitted because it is of the second order of smallness. Dividing both sides of the equation by  $dx$  results in the derivative of a product

$$(VI) \quad \frac{dy}{dx} = \frac{d(uv)}{dx} = u \frac{dv}{dx} + v \frac{du}{dx} \quad (19)$$

This equation states that the derivative of a product is equal to the first variable multiplied by the derivative of the second variable plus the second variable multiplied by the derivative of the first variable.

*Example 8.* Find the derivative of the product  $(x + 1)x^2$ .

*Solution.* Let  $u = x + 1$  and  $v = x^2$

$$\text{Then} \quad \frac{du}{dx} = \frac{d(x + 1)}{dx} = 1$$

$$\text{and} \quad \frac{dv}{dx} = \frac{d(x^2)}{dx} = 2x$$

Substituting in Eq. (19),

$$\frac{d(x + 1)x^2}{dx} = (x + 1)2x + x^2 \cdot 1 = 3x^2 + 2x \quad \text{Ans.}$$

**Derivative of a Quotient.**—Let  $y = \frac{u}{v}$ .

$$\text{As each variable grows,} \quad y + dy = \frac{u + du}{v + dv}$$

Performing the division indicated on the right-hand side to

obtain all terms of the first order of smallness and neglecting all terms of the higher orders of smallness are done as follows:

$$\begin{array}{r}
 \frac{v + dv'u + du \left[ \frac{u}{v} - \frac{u dv}{v^2} + \frac{du}{v} \right]}{u + \frac{u dv}{v}} \\
 \frac{- \frac{u dv}{v} + du}{- \frac{u dv}{v} - \frac{u(dv)^2}{v^2}} \\
 \frac{+ du}{+ du + \frac{du dv}{v}}
 \end{array}$$

The terms  $\frac{u(dv)^2}{v^2}$  and  $\frac{du dv}{v}$  were neglected in this division because of their higher order of smallness.

Thus  $y + dy = \frac{u}{v} + \frac{v du}{v^2} - \frac{u dv}{v^2}$

Subtracting,  $y = \frac{u}{v}$

$$dy = \frac{v du - u dv}{v^2} \quad (20)$$

and dividing both sides by  $dx$  gives the derivative

$$(VII) \quad \frac{dy}{dx} = \frac{d}{dx} \left( \frac{u}{v} \right) = \frac{v \frac{du}{dx} - u \frac{dv}{dx}}{v^2} \quad (21)$$

This equation states that the derivative of a fraction is equal to the denominator multiplied by the derivative of the numerator minus the numerator multiplied by the derivative of the denominator all divided by the denominator squared.

*Example 9.* What is the derivative of  $\frac{x^2 + 2}{\sqrt{x}}$ ?

*Solution.* Let  $u = x^2 + 2$  and  $v = \sqrt{x} = x^{1/2}$

Then  $\frac{du}{dx} = 2x$  and  $\frac{dv}{dx} = \frac{1}{2} x^{-1/2}$

$$\frac{d}{dx} \left( \frac{x^2 + 2}{\sqrt{x}} \right) = \frac{\sqrt{x} \cdot 2x - (x^2 + 2) \frac{1}{2} x^{-1/2}}{x} = \frac{3}{2} \sqrt{x} - \frac{1}{x \sqrt{x}} \quad \text{Ans.}$$

Thus far we have developed the important derivatives for algebraic functions. In most cases graphs have been furnished to illustrate more clearly what happens. Now, to make use of this knowledge, some practical applications will be treated along with some more ideas about differential calculus. In other words, we have the tools; let's learn how to make good use of them.

**Successive Derivatives.**—The idea that a derivative may represent a rate of change has already been given. It is the ratio of the little bit of space covered in the corresponding little bit of time. Let us apply this idea to a freely falling object. From physics, the equation for a freely falling body is

$$s = 16t^2 \quad (22)$$

where  $s$  = space covered by the freely falling body, in feet.

$t$  = time after the body begins to fall, in seconds.

This curve is plotted in Fig. 70 for a time period of 8 seconds. As time increases the space is covered more rapidly. This means that the velocity must be increasing. The velocity, if scientifically expressed, is the derivative of space with respect to time. If applied to Eq. (22), it gives

$$v = \frac{ds}{dt} = 32t \quad (23)$$

where  $v$  = velocity in feet per second.

When this curve is plotted, as shown in Fig. 70, it is noted that the velocity is steadily increasing. Now the rate at which the velocity is increasing is called the "acceleration." Taking the derivative of Eq. (23), which is the second successive derivative, results in

$$a = \frac{dv}{dt} = \frac{d^2s}{dt^2} = 32 \quad (24)$$

where  $a$  = acceleration in feet per second per second, and  $d^2s/dt^2$  = the second derivative of  $s$  with respect to  $t$ . It can also be read "dee squared ess over dec-tee squared." This equation shows that the *acceleration*, due to the force of gravity,

is a constant equal to 32 feet per second per second. This is represented in Fig. 70 by a horizontal straight line.

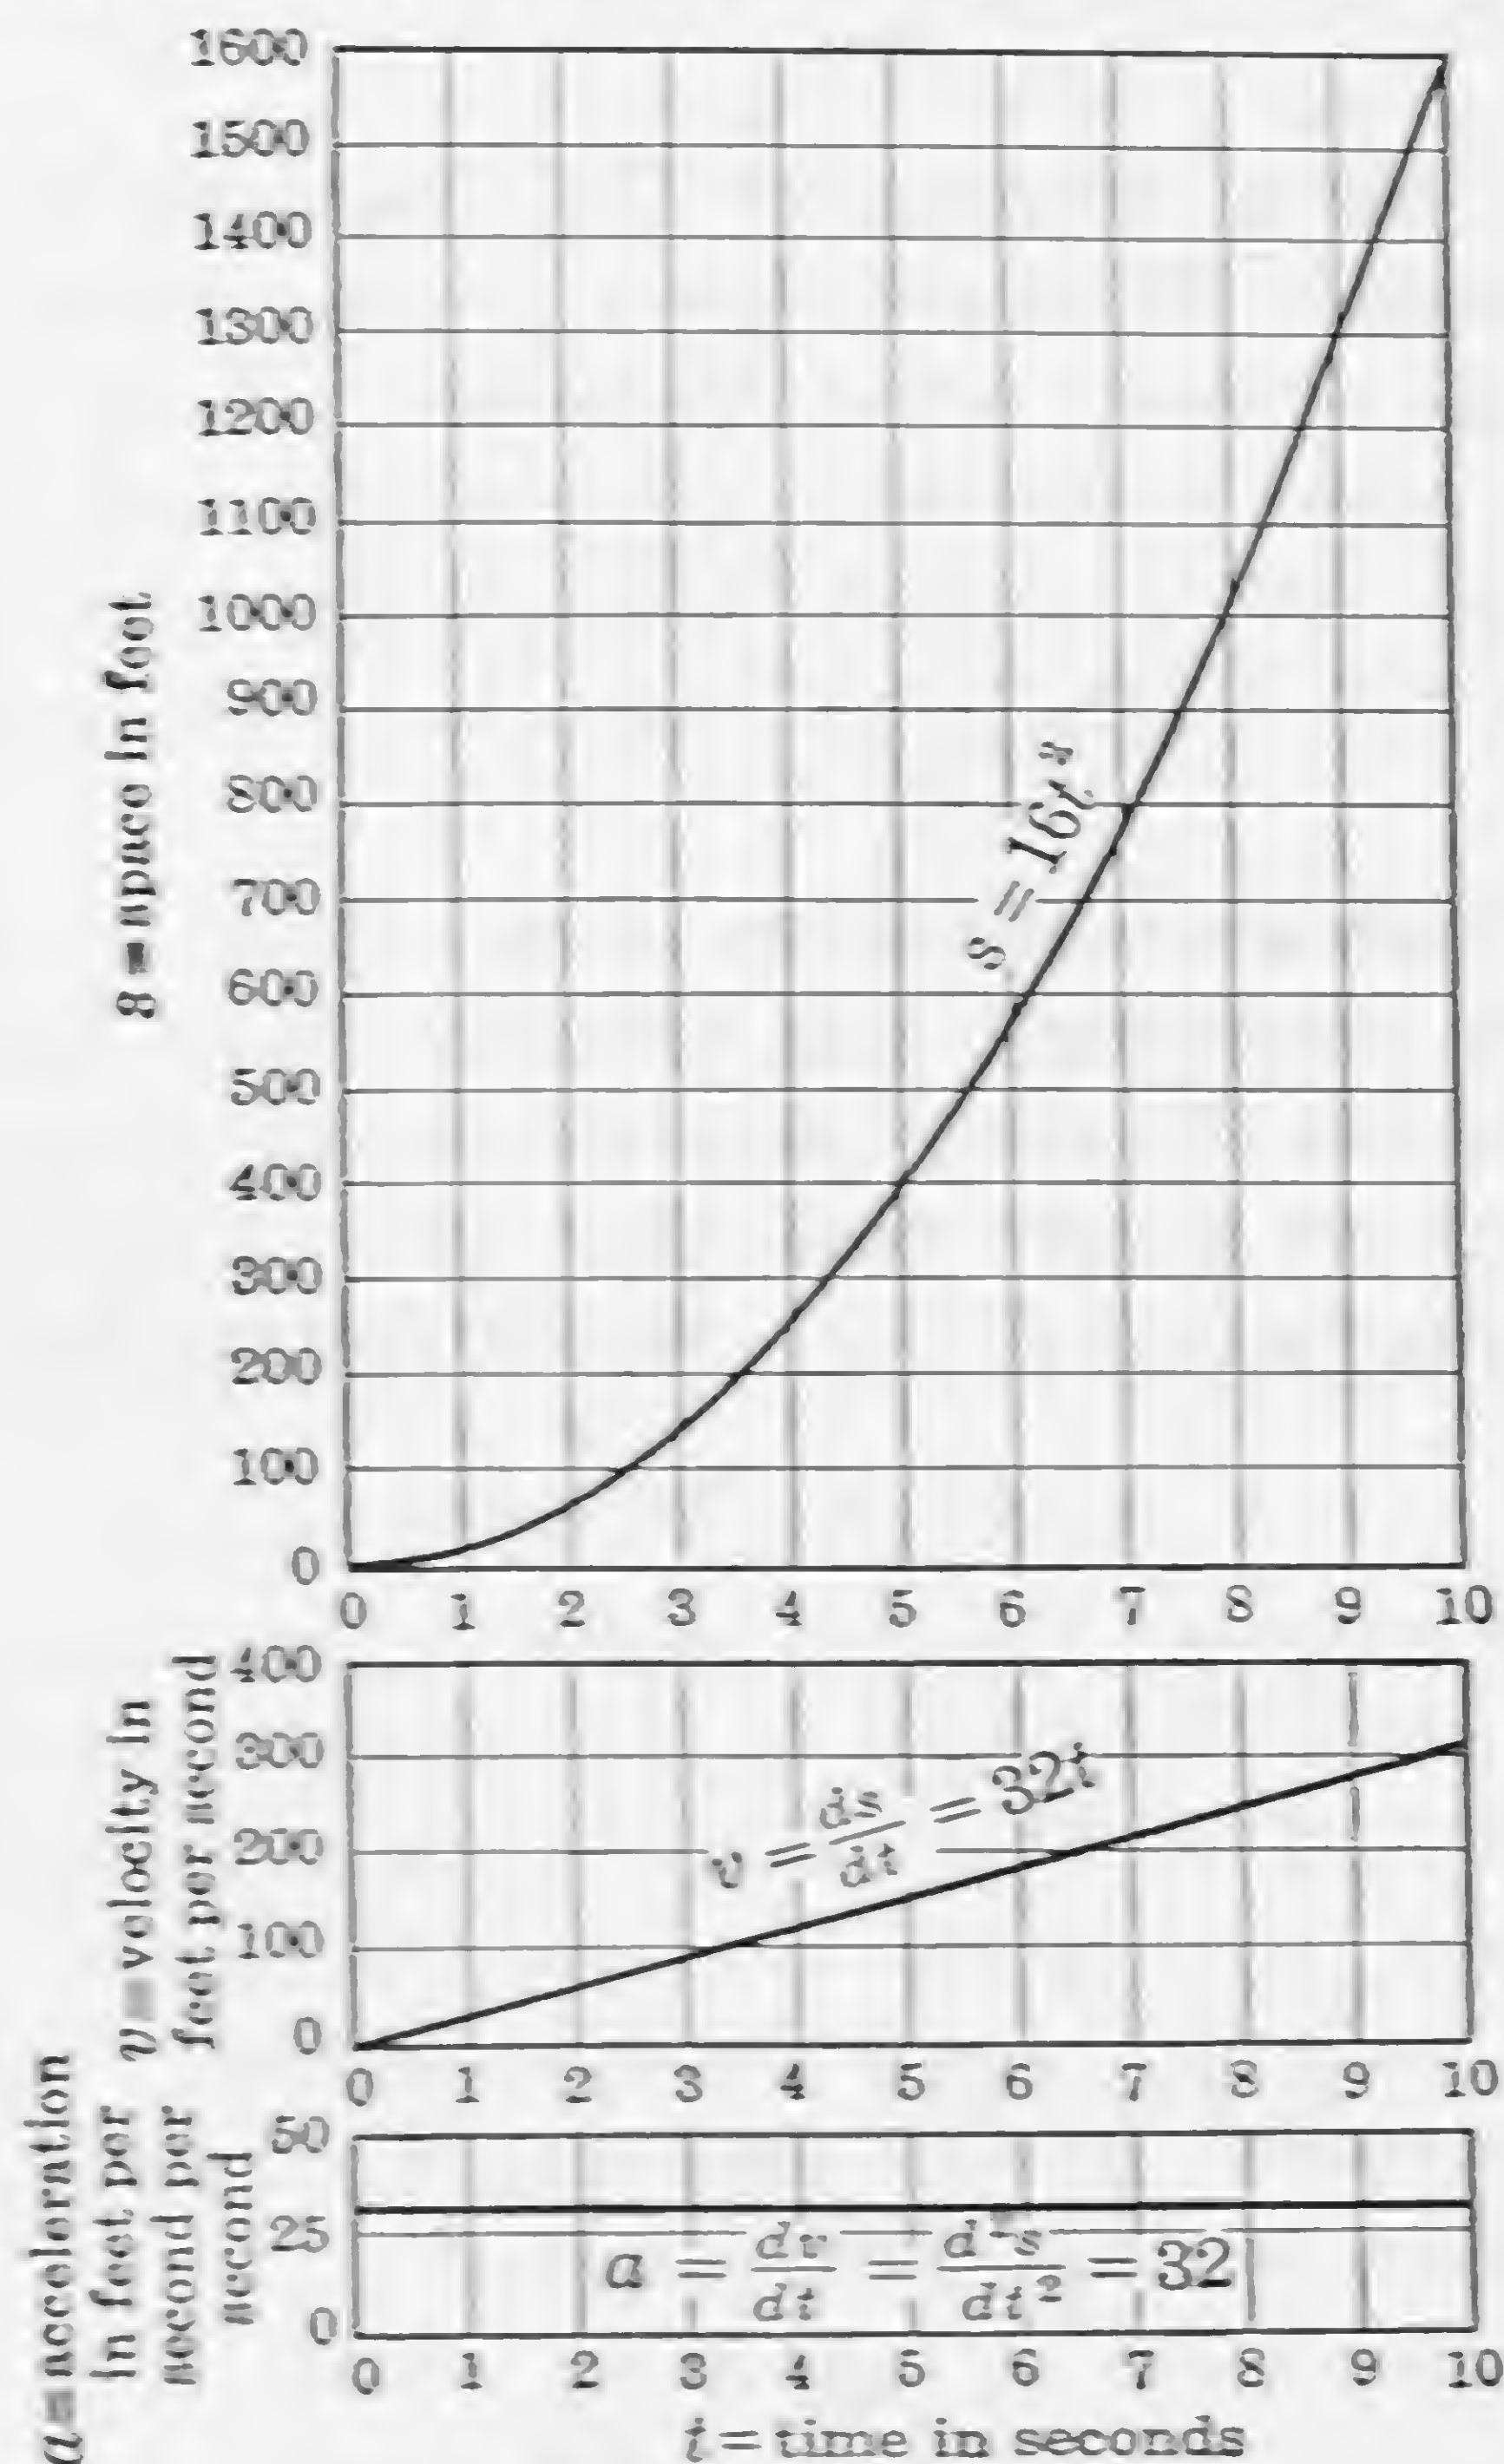

FIG. 70.—Derived curves.

*Example 10.* Determine the fifth derivative of the quantity

$$y = x^5 + 4x^2 + x.$$

*Solution.* Applying Eq. (15) successively,

The first derivative is  $\frac{dy}{dx} = 5x^4 + 8x + 1$

The second derivative is  $\frac{d^2y}{dx^2} = 20x^3 + 8$

The third derivative is  $\frac{d^3y}{dx^3} = 60x^2$

The fourth derivative is  $\frac{d^4y}{dx^4} = 120x$

The fifth derivative is  $\frac{d^5y}{dx^5} = 120$  Ans.

There are three other quite common ways of expressing successive derivatives which are simpler to write as shown in the following table:

TABLE OF SUCCESSIVE DERIVATIVES

$y$	$y$	$f(x)$	$x$	$x$	$f(t)$
$\frac{dy}{dx}$	$y'$	$f'(x)$	$\frac{dx}{dt}$	$\dot{x}$	$f'(t)$
$\frac{d^2y}{dx^2}$	$y''$	$f''(x)$	$\frac{d^2x}{dt^2}$	$\ddot{x}$	$f''(t)$
$\frac{d^3y}{dx^3}$	$y'''$	$f'''(x)$	$\frac{d^3x}{dt^3}$	$\dddot{x}$	$f'''(t)$

**Maxima and Minima.**—One of the principal uses of differential calculus is to find maximum or minimum values. A *maximum point* has a *greater value* than the immediately preceding or following points while a *minimum point* has a *smaller value* than the immediately preceding or following points.

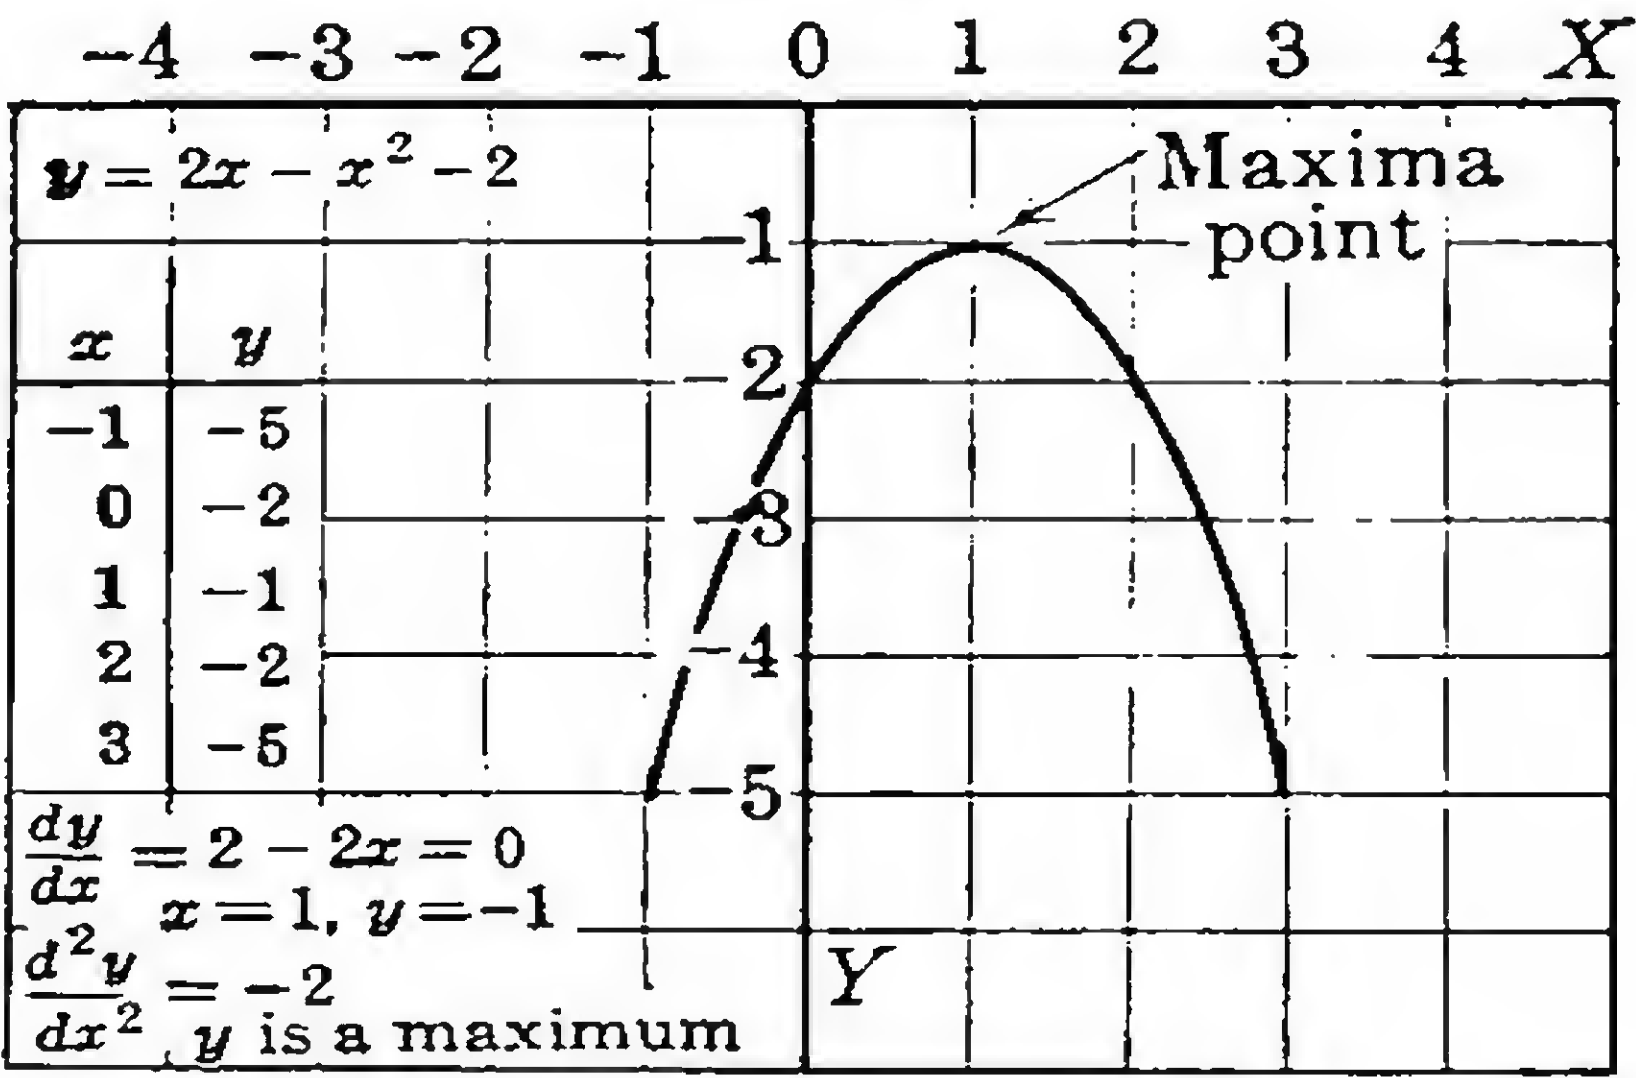

FIG. 71.—Curve with a maxima point.

In many practical engineering problems we are concerned with finding the conditions that will give the greatest (maximum) value or the least (minimum) value. To illustrate, it may be desired to find the conditions for the maximum efficiency of a machine or it may be desired to determine the conditions that will make the cost a minimum.

As a concrete case, consider the equation  $y = 2x - x^2 - 2$  as plotted in Fig. 71. It appears from the curve that  $y$  reaches a maximum value when  $x = 1$ . This can be checked by solving for points very close to  $x = 1$  and finding that they all have smaller values. Instead of doing all this guessing, differential calculus can be used to determine the maximum directly. It

will be recalled that the derivative of a constant is zero. Such a curve is horizontal, that is, its slope is zero. Now, at the maximum height of the curve in Fig. 71, the slope is zero, that is, the curve is horizontal. Therefore, if we set the derivative  $dy/dx = 0$  and solve for  $x$ , it is possible to determine the maximum<sup>1</sup> value of  $y$  by substituting this value of  $x$  in the original equation.

Performing these operations on the equation,

$$y = 2x - x^2 - 2$$

The derivative is

$$\frac{dy}{dx} = 2 - 2x$$

Setting this quantity equal to zero,

$$2 - 2x = 0$$

Solving for  $x$ ,

$$x = 1 \quad \text{Ans.}$$

This means that the maximum will occur when the value of  $x$  is exactly equal to 1. Substituting this value of  $x$  into the original equation,

$$y = 2 - 1 - 2 = -1 \quad \text{Ans.}$$

This means that the maximum value of  $y$  is exactly equal to  $-1$ .

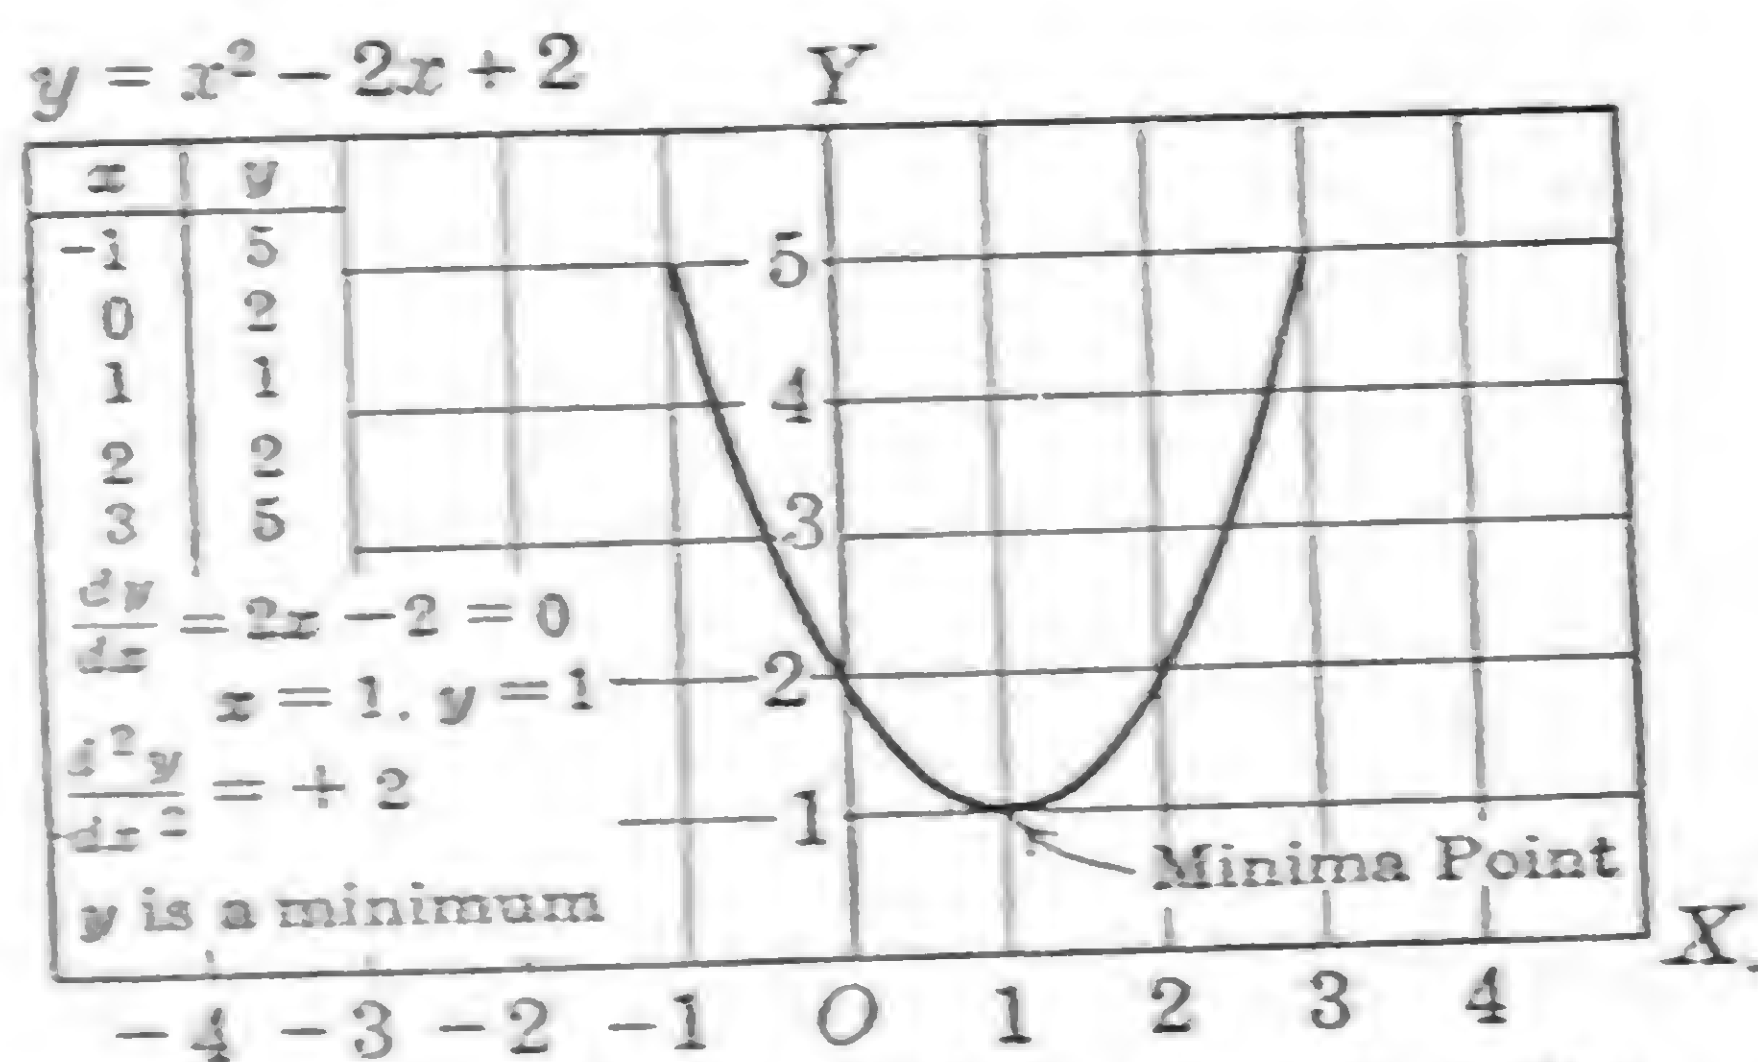

FIG. 72.—Curve with a minima point.

**Example 11.** Find the maximum load power  $P_L$  and value of load resistance  $R_L$  when the generator resistance is  $R_g$  and the equation of power transfer is

$$P_L = \frac{R_L}{(R_g + R_L)^2}$$

<sup>1</sup> In some cases, as will be shown later, this procedure may give a minimum or inflection point.

in Eq. (21). The derivatives are then

$$\frac{du}{dR_L} = \frac{dR_L}{dR_L} = 1 \quad \text{and} \quad \frac{dv}{dR_L} = \frac{d(R_s + R_L)^2}{dR_L} = 2(R_s + R_L)$$

Now, substituting these values into Eq. (21) results in

$$\frac{dP_L}{dR_L} = \frac{(R_s + R_L)^2 - R_L 2(R_s + R_L)}{(R_s + R_L)^4} = \frac{R_s + R_L - 2R_L}{(R_s + R_L)^3} = 0$$

This equation is true when the numerator is zero, hence

$$R_s + R_L - 2R_L = 0 \quad \text{or} \quad R_L = R_s \quad \text{Ans.}$$

As another case, consider the equation  $y = x^2 - 2x + 2$  which is plotted in Fig. 72. The curve appears to reach a minimum value of  $y = 1$  when  $x = 1$ . To check this, take the first derivative and equate it to zero, thus

$$\frac{dy}{dx} = 2x - 2 = 0$$

Hence,

$$x = 1 \quad \text{Ans.}$$

Substituting this value in the original equation.

$$y = 1 - 2 + 2 = 1 \quad \text{Ans.}$$

**Example 12.** The cost  $C$  of handling vacuum tubes in a factory varies with the output  $N$  per day according to the relation

$$C = a + \frac{b}{N} + cN$$

where  $a$ ,  $b$ , and  $c$  are constants. For what output will the cost be least?

**Solution.** Taking the first derivative and equating to zero,

$$\frac{dC}{dN} = \frac{-b}{N^2} + c = 0$$

Solving this equation, 
$$N = \sqrt{\frac{b}{c}} \quad \text{Ans.}$$

It should be observed that if a tangent were drawn to either the maximum point of the curve in Fig. 71 or the minimum point of the curve in Fig. 72, the slope or first derivative is zero. In order to determine which of these values are maximum or minimum points, a portion of the curve can be sketched near these points. Another way to determine if the point is a maximum or a minimum is to take the second derivative. If the second derivative is negative, the point is a maximum, and, vice versa, if the second derivative is positive the point is a minimum. The rules to remember are as follows:

If  $\frac{dy}{dx} = 0$  and  $\frac{d^2y}{dx^2} = -$ ,  $y$  is a maximum.

If  $\frac{dy}{dx} = 0$  and  $\frac{d^2y}{dx^2} = +$ ,  $y$  is a minimum.

Applying these rules, the curve in Fig. 71 results in a negative second derivative, thus

$$y = 2x - x^2 - 2$$

First derivative  $\frac{dy}{dx} = 2 - 2x$

Second derivative  $\frac{d^2y}{dx^2} = -2$

Hence  $y$  is a maximum.

Similarly, applying these rules to the curve of Fig. 72 results in a positive derivative, thus

$$y = x^2 - 2x + 2$$

First derivative  $\frac{dy}{dx} = 2x - 2$

Second derivative  $\frac{d^2y}{dx^2} = +2$

Hence  $y$  is a minimum.

**Inflection Point.**—The above test for a maximum or minimum fails when the second derivative is zero. Resort should then be

$$y = x^3 - 6x^2 + 9x$$

$$\frac{dy}{dx} = 3x^2 - 12x + 9 = 0$$

$$x = 1 \text{ or } 3$$

$$\frac{d^2y}{dx^2} = 6x - 12$$

$$\text{For } x = 1, \frac{d^2y}{dx^2} = -6$$

$$y = +4 \text{ a maximum}$$

$$\text{For } x = 3, \frac{d^2y}{dx^2} = +6$$

$$y = 0 \text{ a minimum}$$

$$\text{For } \frac{d^2y}{dx^2} = 0,$$

$$\left. \begin{array}{l} x = 2 \\ y = 2 \end{array} \right\} \text{ an inflection point}$$

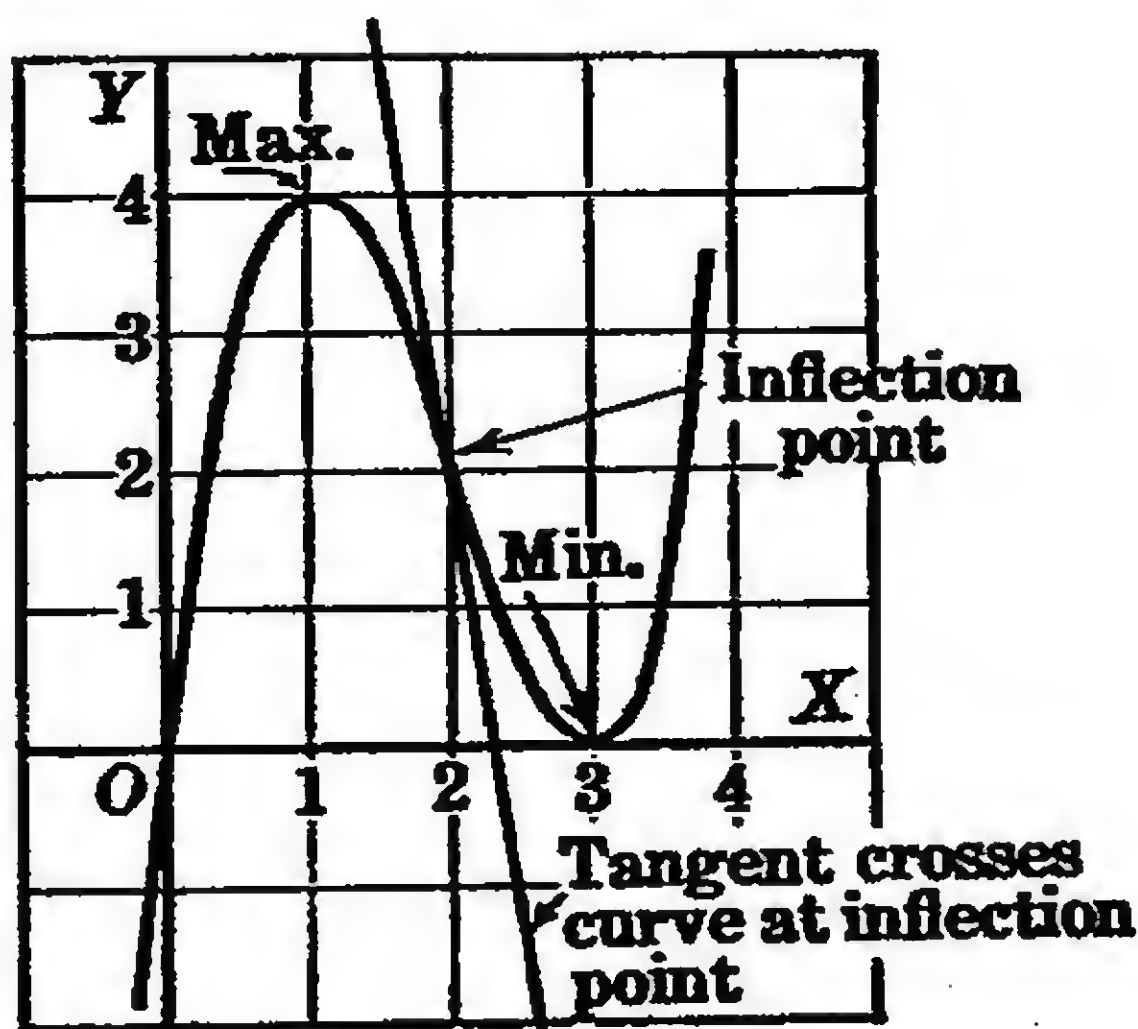

FIG. 73.—Curve with maxima, minima, and inflection point.

made to sketching the curve near the point in question. If the curve bends in opposite directions on either side of a given point

that point is called an "inflection point." In other words, an inflection point separates an upward concave portion of a curve ( $\smile$ ) from a downward concave portion of the curve ( $\frown$ ). At an inflection point a tangent to the curve will cross the curve. The rule can be stated as follows:

If  $\frac{dy}{dx} = 0$  and  $\frac{d^2y}{dx^2} = 0$ ,  $y$  is an inflection point, a maximum, or a minimum. In this case, the curve should be plotted to determine its exact nature.

*Example 13.* Find the maximum, minimum, and inflection-point values and plot the curve

$$y = x^3 - 6x^2 + 9x$$

*Solution.* The first derivative is  $\frac{dy}{dx} = 3x^2 - 12x + 9 = 0$

By the quadratic formula,  $x = 1$  or  $3$

The second derivative is  $\frac{d^2y}{dx^2} = 6x - 12$

If  $x = 1$ ,  $\frac{d^2y}{dx^2} = -6$ , hence a maximum at

$$y = 1 - 6 + 9 = +4 \quad \text{Ans.}$$

If  $x = 3$ ,  $\frac{d^2y}{dx^2} = +6$ , hence a minimum at

$$y = 27 - 54 + 27 = 0 \quad \text{Ans.}$$

Let  $\frac{d^2y}{dx^2} = 6x - 12 = 0$

Then  $x = 2$

and  $y = 8 - 24 + 18 = +2 \quad \text{Ans.}$

From the plotted curve as shown in Fig. 73, we see that the last point is an inflection point.

$$y = x^3 - 6x^2 + 9x$$

$$\frac{dy}{dx} = 3x^2 - 12x + 9 = 0$$

$$x = 1 \text{ or } 3$$

$$\frac{d^2y}{dx^2} = 6x - 12$$

For  $x = 1$ ,  $\frac{d^2y}{dx^2} = -6$ ,  $y = +4$  a maximum

For  $x = 3$ ,  $\frac{d^2y}{dx^2} = +6$ ,  $y = 0$  a minimum

For  $\frac{d^2y}{dx^2} = 0$

$$\left. \begin{array}{l} x = 2 \\ y = 2 \end{array} \right\} \text{an inflection point}$$

## Summary.

### 1. Algebraic differentiation formulas:

$$(I) \quad \frac{dc}{dx} = 0$$

$$(II) \quad \frac{dx}{dx} = 1$$

$$(III) \quad \frac{d}{dx}(cx) = c$$

$$(IV) \quad \frac{d}{dx}(x^n) = nx^{n-1}$$

$$(V) \quad \frac{d}{dx}(u + v) = \frac{du}{dx} + \frac{dv}{dx}$$

$$(VI) \quad \frac{d}{dx}(uv) = u \frac{dv}{dx} + v \frac{du}{dx}$$

$$(VII) \quad \frac{d}{dx}\left(\frac{u}{v}\right) = \frac{v \frac{du}{dx} - u \frac{dv}{dx}}{v^2}$$

2. Successive differentiation is the process of repeating the operation of differentiating a function. These successive operations result in the "first derivative," "second derivative," and so on to the "nth derivative."

3. If  $\frac{dy}{dx} = 0$  and  $\frac{d^2y}{dx^2} = -$ ,  $y$  is a maximum.

4. If  $\frac{dy}{dx} = 0$  and  $\frac{d^2y}{dx^2} = +$ ,  $y$  is a minimum.

5. If  $\frac{dy}{dx} = 0$  and  $\frac{d^2y}{dx^2} = 0$ ,  $y$  is an inflection point, a maximum, or a minimum. In this case, the curve should be plotted to determine its nature.

### Exercises

Differentiate the following five equations:

1.  $y = ax^2 + bx + c$

2.  $y = \sqrt{2x^3}$

3.  $y = (a + x)^2$

4.  $y = x \sqrt{a + bx}$

5.  $y = \frac{a - x}{a + x}$

6. What is the second derivative of  $y = \sqrt{x}$ ?

7. The current  $I$  depends upon the temperature  $t$  of an incandescent lamp by the equation

$$I = a + bt + ct^2$$

## CHAPTER 13

### DIFFERENTIAL CALCULUS TREATING TRANSCENDENTAL FUNCTIONS

As pointed out in the last chapter, a transcendental function is any function that is not a simple algebraic function. Transcendental functions are irrational functions such as  $e^x$ ,  $\sin x$ , and  $\log x$ .

**The Law of Natural Growth.**—The law of natural growth results when the increase in size of a quantity is always proportional to the size of the quantity. This is illustrated by nature when an organism's growth is proportional to the size of the organism. This could also be called a "logarithmic rate" of growing because the percentage increase is always proportional to the magnitude at that instant.

Studying two cases will help to clarify this law. Consider the difference between constant and natural growth as illustrated in simple and compound interest. With simple interest, the capital grows arithmetically at unit rate while with compound interest the capital grows logarithmically at unit rate.

*Simple Interest.*—Start with a capital of \$1 and let the interest rate be  $\frac{1}{10}$  or 10 per cent per year. The owner will then make 10 cents on this dollar each year. By saving this interest each year he will have a total capital of \$2 at the end of 10 years, to double his property.

Stating this problem in general terms, let  $x$  be the original capital and  $1/n$  be the yearly interest rate, then it will take  $n$  years to double his property, that is

$$x + n \left( \frac{x}{n} \right) = 2x \quad (1)$$

For the first year the owner has \$1. At the end of the year he receives 10 cents in interest. He saves this 10 cents during the following year and collects another 10 cents at the end of the second year. This process is shown graphically in Fig. 74 for

the whole 10 years. The total capital of the owner at any time is represented by the stair step curve.

*Compound Interest.*—As before, start with a capital of \$1 and let the interest rate be  $\frac{1}{10}$  or 10 per cent per year. If the interest is compounded every 10 years, then the owner will receive all the interest at the end of 10 years. This will amount to \$1, making, with the original investment, a total capital of \$2. In equation form, this can be stated,

$$x_1 = x_0 + \frac{x_0}{1} = x_0 \left(1 + \frac{1}{1}\right) = x_0 (2) \quad (2)$$

where  $x_1$  = capital at end of 1 operation.

$x_0$  = original capital.

Now consider compounding the interest every 5 years for two operations. The initial capital is  $x_0$ , the interest for the first 5 years is one half the above amount or  $\frac{x_0}{2}$  and for the next

5 years, the interest is  $\frac{x_0 + \frac{x_0}{2}}{2}$ ; hence, in equation form,

$$\begin{aligned} x_2 &= x_0 + \frac{x_0}{2} + \frac{x_0 + \frac{x_0}{2}}{2} = x_0 \left(1 + 2 \cdot \frac{1}{2} + \frac{1}{4}\right) \\ &= x_0 \left(1 + \frac{1}{2}\right)^2 = x_0 (2.25) \end{aligned} \quad (3)$$

If the interest is compounded three times in 10 years, this reasoning leads to the following equation:

$$\begin{aligned} x_3 &= x_0 + \frac{x_0}{3} + \frac{x_0 + \frac{x_0}{3}}{3} + \frac{x_0 + \frac{x_0}{3} + \frac{x_0 + \frac{x_0}{3}}{3}}{3} \\ &= x_0 \left(1 + \frac{1}{3}\right)^3 = 2.37 \end{aligned} \quad (4)$$

If the interest is compounded yearly, the equation is

$$x_{10} = x_0 \left(1 + \frac{1}{10}\right)^{10} = 2.594 \quad (5)$$

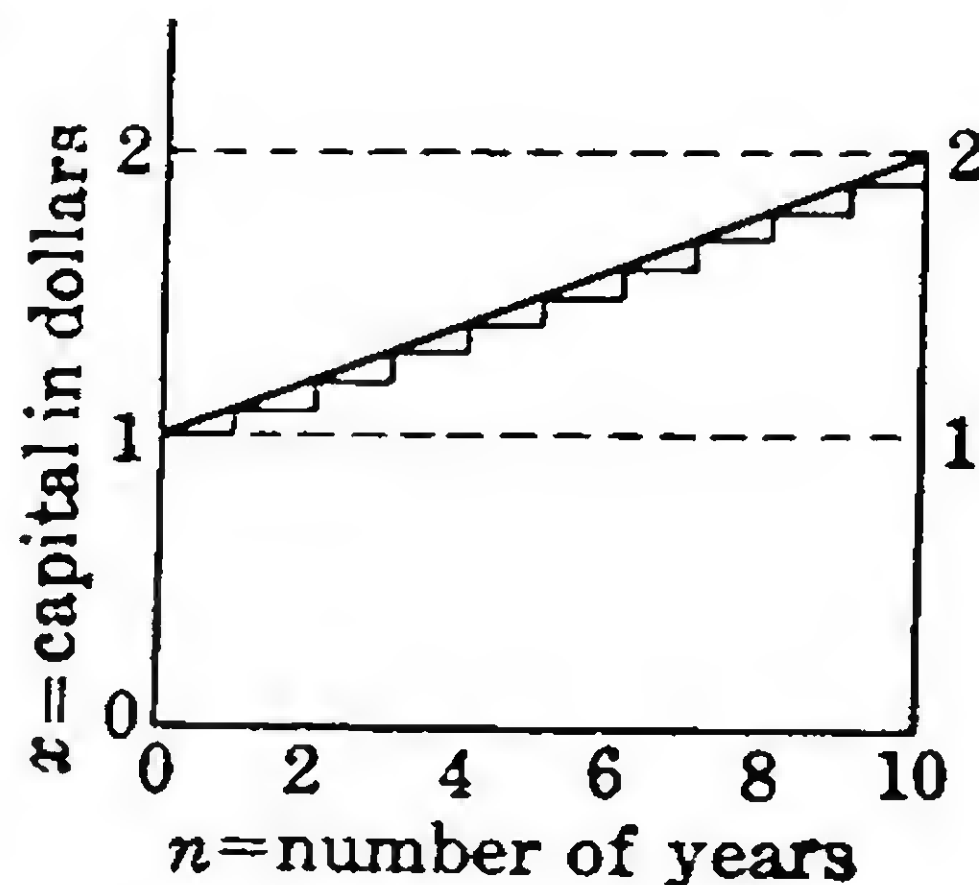

FIG. 74.—Curve of simple interest at the rate of 10 per cent for 10 years.

A similarity will be noted among Eqs. (2), (3), (4), and (5). Generalizing for  $n$  operations,

$$x_n = x_0 \left(1 + \frac{1}{n}\right)^n$$

where  $x_n$  = capital at end of  $n$  operations.

$x_0$  = original capital.

$n$  = number of operations.

Now if  $n$  is made larger and larger, the value of  $x_n$  comes closer and closer to a limiting value which is the *natural number*

$$\epsilon = 2.7182818 \dots \quad (7)$$

This number is even more important than  $\pi$ , which equals 3.141592 . . . Let us summarize what  $\epsilon$  (epsilon) means. As

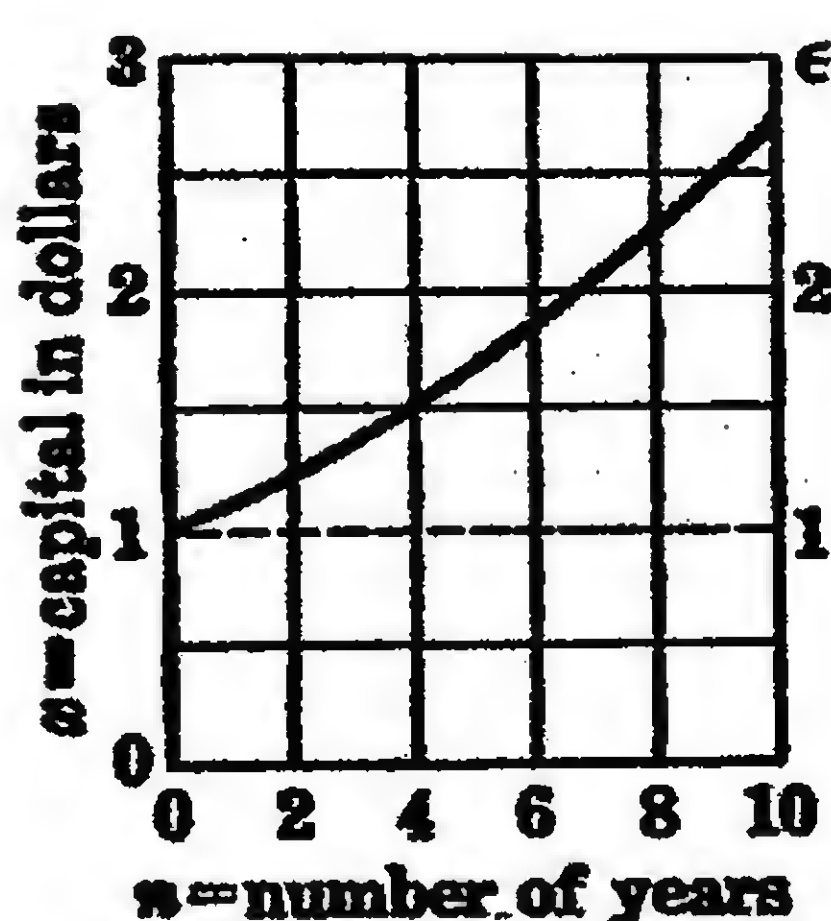

FIG. 75.—Curve of true compound interest at the rate of 10 per cent for 10 years.

shown above, if \$1 grows at simple interest, it will become \$2, but if the interest is truly compounded for this same period of time, it will become \$2.718 . . . or  $\epsilon$  times the original capital. If this truly compounded curve is drawn graphically, the curve of Fig. 75 results.

**Exponential Series.**—There is another way of determining the value of the natural number  $\epsilon$ . From the Eq. (6), we see that the quantity  $(1 + 1/n)^n$  will become equal to  $\epsilon$  if the number  $n$  is made indefinitely large. But by the binomial theorem, this quantity can be written

$$\left(1 + \frac{1}{n}\right)^n = 1 + 1 + \frac{1}{2} \frac{n-1}{n} + \frac{1}{3} \frac{(n-1)(n-2)}{n^2} + \dots \quad (8)$$

But, to express  $\epsilon$ ,  $n$  becomes very great, hence  $(n-1)$  and  $(n-2)$  are for all practical purposes equal to  $n$ , hence, we can write the series

$$\epsilon = 1 + 1 + \frac{1}{2} + \frac{1}{3} + \dots$$

which will give the value of  $\epsilon$  to any desired accuracy by taking the required number of terms.

Carrying this reasoning one step farther,  $e$  can be raised to the  $x$  power by expanding the expression

$$\left(1 + \frac{1}{n}\right)^{nx} = 1^{nx} + nx \frac{1^{nx-1} (1/n)}{1} + nx (nx - 1) \frac{1^{nx-2} (1/n)^2}{2} + \dots$$

By making  $n$  indefinitely large, we reduce this equation to the *exponential series*

$$e^x = 1 + x + \frac{x^2}{2} + \frac{x^3}{3} + \dots \quad (10)$$

This series represents a natural growth curve as shown in Fig. 76 where  $y = e^x$ . At  $x = 1$ , the value of  $y$  is the natural number  $e$ .

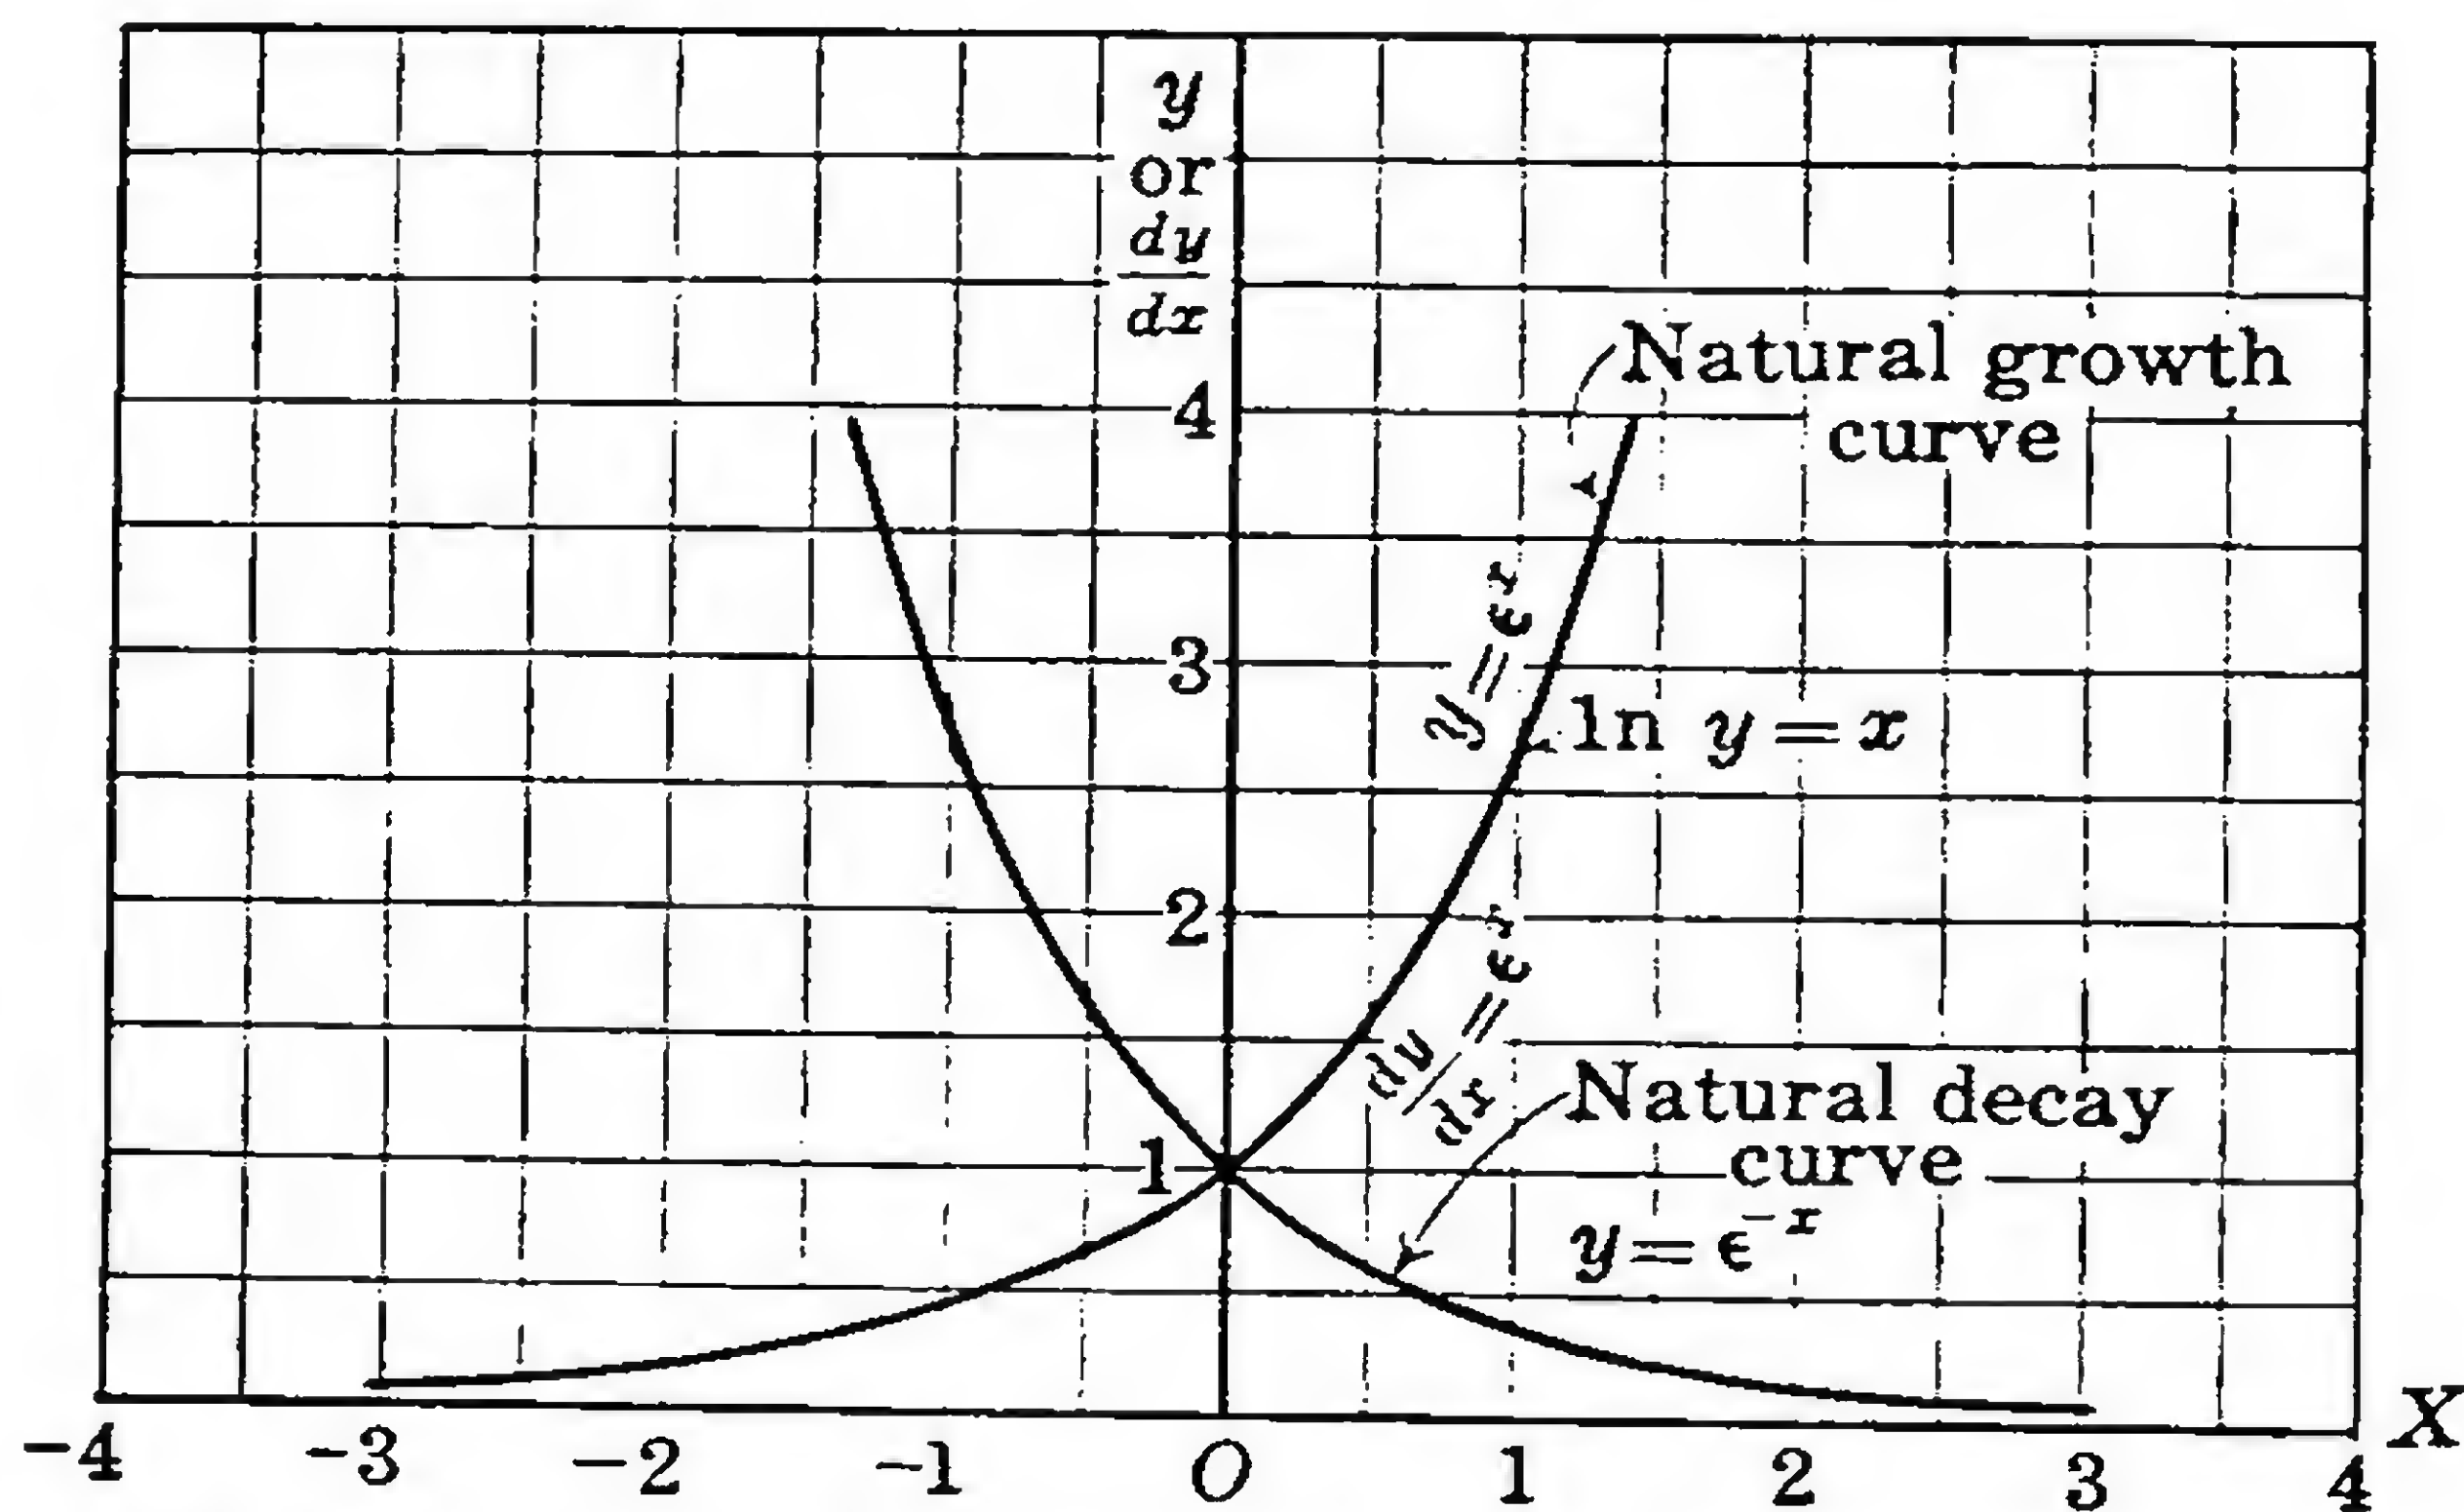

FIG. 76.—Curves of natural growth and of natural decay.

**Example 1.** Compute the value of  $e$  to five decimal places by using the exponential series.

**Solution.**

$$\begin{aligned} 1 + 1 &= 2.00000 \\ 1/2 &= 0.50000 \\ 1/3 &= 0.16667 \\ 1/4 &= 0.04167 \\ 1/5 &= 0.00833 \\ 1/6 &= 0.00139 \\ 1/7 &= 0.00020 \\ 1/8 &= 0.00002 \end{aligned}$$

Then

$$e = 2.71828. \quad \text{Ans.}$$

**The Law of Natural Decay.**—Since the reverse process of growth is decay, consideration will now be given to natural decay or die-away curves. Just as  $e$  is the measure of natural growth, so  $1/e$  or  $e^{-1}$  is the measure of natural decay. Applying this reasoning to the exponential series by changing the sign of  $x$  results in

$$e^{-x} = 1 - x + \frac{x^2}{2} - \frac{x^3}{3} + \dots \quad (11)$$

Then, making  $x = 1$ , the value of  $e^{-1}$  becomes

$$\frac{1}{e} = e^{-1} = 1 - 1 + \frac{1}{2} - \frac{1}{3} + \dots = 0.36788 \dots \quad (12)$$

Now, just as a quantity of unit size naturally grows to 2.71828, so does a quantity of unit size naturally die-away to 0.36788.

As a practical illustration, the natural cooling of a hot body obeys the law

$$y = ae^{-bt} \quad (13)$$

where  $y$  is the temperature at any given time  $t$  while  $a$  and  $b$  are constants.

To illustrate the nature of this natural decay curve, it has been plotted in Fig. 76.

Both the natural growth and decay curves have very important electrical engineering applications. As for example, the change in signal strength along a telephone line obeys these natural laws, and the natural time constant of circuits also can be explained by them.

**Derivative of the Exponential Function  $e^x$ .**—When  $y = e^x$ , the curve of Fig. 76 results. It will be noted that this is simply an extension of the curve of Fig. 75. A further study will reveal that this curve has very special properties. Using the exponential series as given in Eq. (10), it is found that *the derivative is the same as the original value*.

$$\begin{aligned} \text{Thus } \frac{d}{dx}(e^x) &= 0 + 1 + \frac{2x}{2} + \frac{3x^2}{3} + \frac{4x^3}{4} + \dots \\ &= 1 + x + \frac{x^2}{2} + \frac{x^3}{3} + \dots \quad (14) \end{aligned}$$

This series is the same as that given in Eq. (10); hence

$$(VIII) \quad \frac{d}{dx} (\epsilon^x) = \epsilon^x \quad (15)$$

The derivative of the exponential function  $\epsilon^x$  remains unchanged. In other words, the slope of the curve  $y = \epsilon^x$  is always  $dy/dx = \epsilon^x$ .

*Example 2.* What is the derivative of  $\epsilon^{-x}$ ?

*Solution.* Taking the derivative of the series in Eq. (11),

$$\begin{aligned} \frac{d}{dx} \epsilon^{-x} &= -1 + \frac{2x}{\underline{2}} - \frac{3x^2}{\underline{3}} + \frac{4x^3}{\underline{4}} - \dots \\ &= -\left(1 - x + \frac{x^2}{\underline{2}} - \frac{x^3}{\underline{3}} + \dots\right) = -\epsilon^{-x} \quad \text{Ans.} \end{aligned}$$

**Derivative of the Exponential Function  $\epsilon^{ax}$ .**—When a constant is multiplied by the variable exponent of an exponential function,

$$y = \epsilon^{ax} = 1 + ax + \frac{(ax)^2}{\underline{2}} + \frac{(ax)^3}{\underline{3}} + \dots \quad (16)$$

The derivative of the series is then

$$\begin{aligned} \frac{dy}{dx} &= \frac{d}{dx} (\epsilon^{ax}) = 0 + a + \frac{2a^2x}{\underline{2}} + \frac{3a^3x^2}{\underline{2}} + \dots \\ &= a \left(1 + ax + \frac{(ax)^2}{\underline{2}} + \frac{(ax)^3}{\underline{3}} + \dots\right) \end{aligned}$$

By Eq. (16), the series in the parenthesis is  $\epsilon^{ax}$ ; hence

$$(IX) \quad \frac{d}{dx} (\epsilon^{ax}) = a\epsilon^{ax} \quad (17)$$

The derivative of an exponential function  $\epsilon^{ax}$  where  $a$  is a constant is equal to the constant  $a$  multiplied by the exponential  $\epsilon^{ax}$ .

*Example 3.* Find the derivative of  $y = \epsilon^{2x}$  and plot the curve of both functions.

*Solution.* By Eq. (15),  $\frac{dy}{dx} = \frac{d}{dx} (\epsilon^{2x}) = 2\epsilon^{2x}$ . *Ans.*

For the curves see Fig. 77. It will be noted that for each value of  $x$ , the slope of the derived curve is twice that of the original curve.

**Natural and Common Logarithms.**—The natural number  $e$  is also important because of its mathematical use as the base of natural logarithms. The equation  $y = e^x$  can be written

$$\ln y = x \quad (18)$$

because the natural logarithm of  $y$  is equal to the power  $x$  to which the base  $e$  must be raised to produce the number.

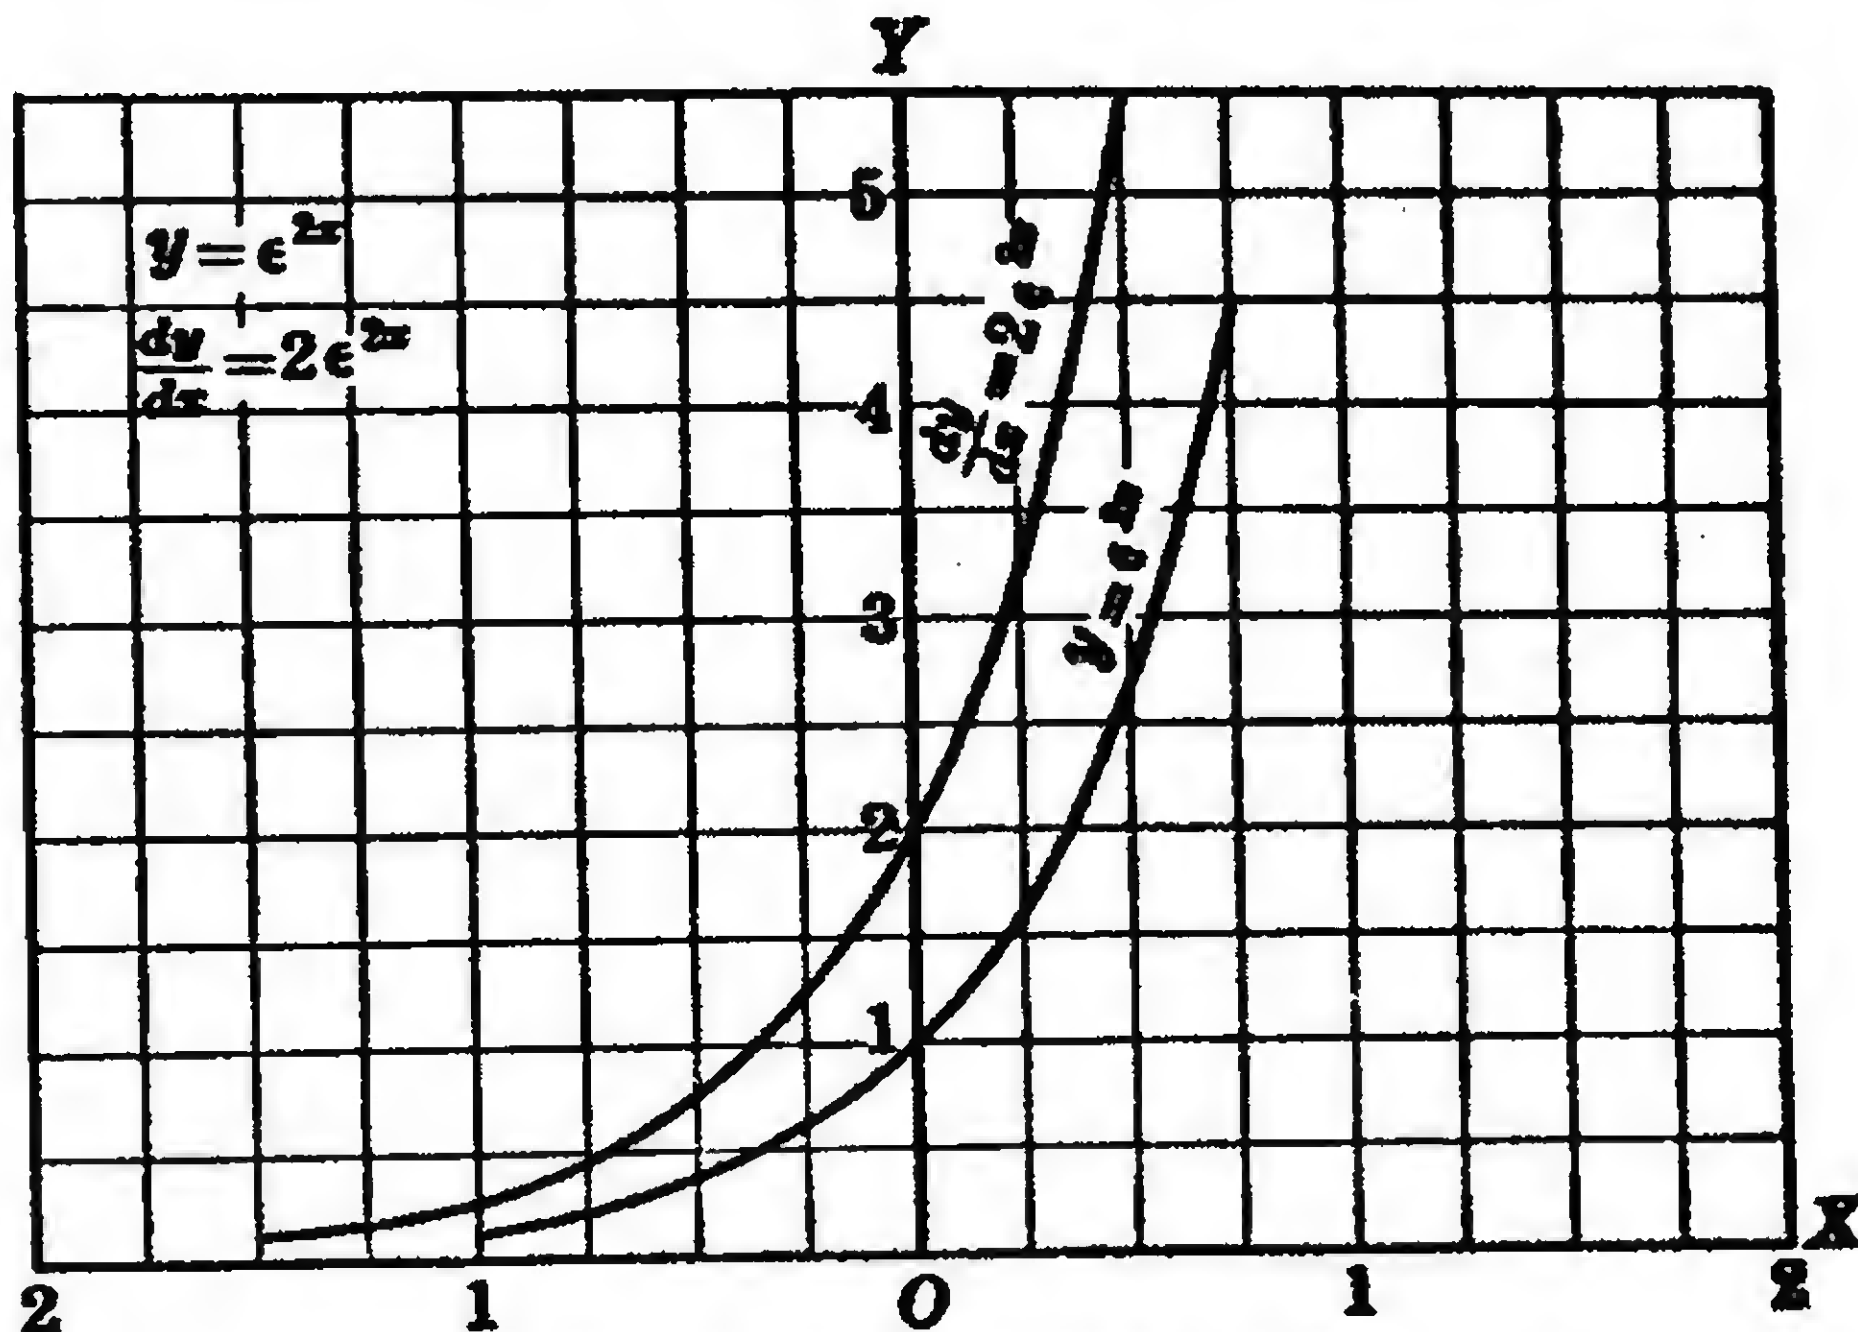

FIG. 77.—Exponential curves of  $e^{2x}$  and  $2e^{2x}$ .

The relationship between natural and common logarithms is often of interest. A natural logarithm can be changed to a common logarithm by multiplying it by the common logarithm of  $e$ , that is

$$\log x = \log e \ln x = 0.4343 \ln x \quad (19)$$

Conversely the common logarithm of  $x$  can be converted to the natural logarithm of  $x$  by multiplying it by the natural logarithm of 10, that is,

$$\ln x = \ln 10 \log x = 2.303 \log x \quad (20)$$

**Example 4.** Find the natural logarithm of  $x = 6$  and then convert to find the common logarithm.

**Solution.** From tables,  $\ln 6 = 1.7918$

By Eq. (19)  $\log 6 = (0.4343)(1.7918) = 0.7782$ . *Ans.*

From tables  $\log 6 = 0.7782$ . *Check.*

**Example 5.** Find the common logarithm of  $x = 25$  and then convert to find the natural logarithm.

*Solution.* From tables,  $\log 25 = 1.3979$

By Eq. (20)  $\ln 25 = (2.303)(1.3979) = 3.2193$ . *Ans.*

From tables,  $\ln 25 = \ln 2.5 \ln 10$

$$= 0.9163 + 2.303 = 3.2193. \text{ Check.}$$

**Derivative of a Natural Logarithm.**—The problem is to find the derivative of the natural logarithm of  $x$ . The equation is

$$y = \ln x$$

From the definition of logarithms,

$$x = e^y$$

Taking the derivative,

$$\frac{dx}{dy} = \frac{d}{dy} (e^y) = e^y = x$$

Inverting the terms in this equation,

$$\frac{dy}{dx} = \frac{1}{\frac{dx}{dy}} = \frac{1}{e^y} = \frac{1}{x} = x^{-1}$$

Therefore, substituting  $y = \ln x$ , we have

$$(X) \quad \frac{d}{dx} (\ln x) = \frac{1}{x} \quad (21)$$

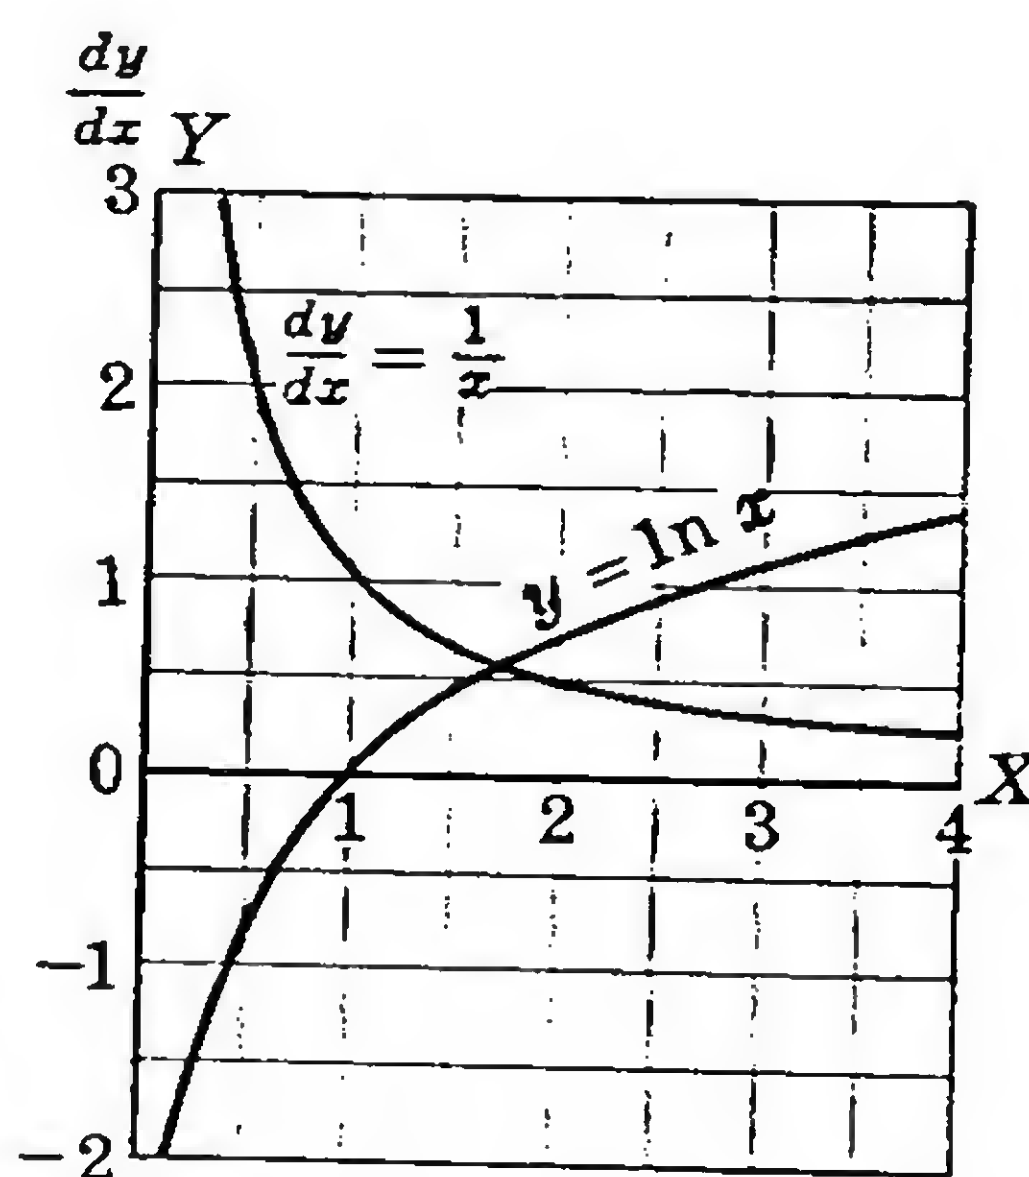

FIG. 78.—Curves of the natural logarithmic function of  $x$  and its derivative.

The curve of  $y = \ln x$  and its derivative are shown in Fig. 78. It will be noted that the slope of the original curve keeps decreasing as the value of  $x$  increases. The magnitude of this slope is expressed by the derived curve.

*Example 6.* Find the derivative of  $y = \ln (ax + b)$ .

*Solution.* Now,

$$e^y = ax + b$$

Solving for  $x$ ,

$$x = \frac{1}{a} e^y - \frac{b}{a}$$

Then

$$\frac{dx}{dy} = \frac{1}{a} \frac{d(e^y)}{dy} + 0 = \frac{1}{a} (e^y)$$

Inverting,

$$\frac{dy}{dx} = \frac{a}{e^y} = \frac{a}{ax + b} \text{ Ans.}$$

**Derivative of Sin  $\theta$ .**—The problem is to find the derivative of the equation  $y = \sin \theta$ . Resorting to the basic idea of

increasing each variable a little bit and subtracting the original function as shown in Fig. 79, we have

$$\begin{array}{rcl} y + dy & = & \sin(\theta + d\theta) \\ \text{Subtracting } y & = & \sin \theta \\ \hline dy & = & \sin(\theta + d\theta) - \sin \theta \end{array}$$

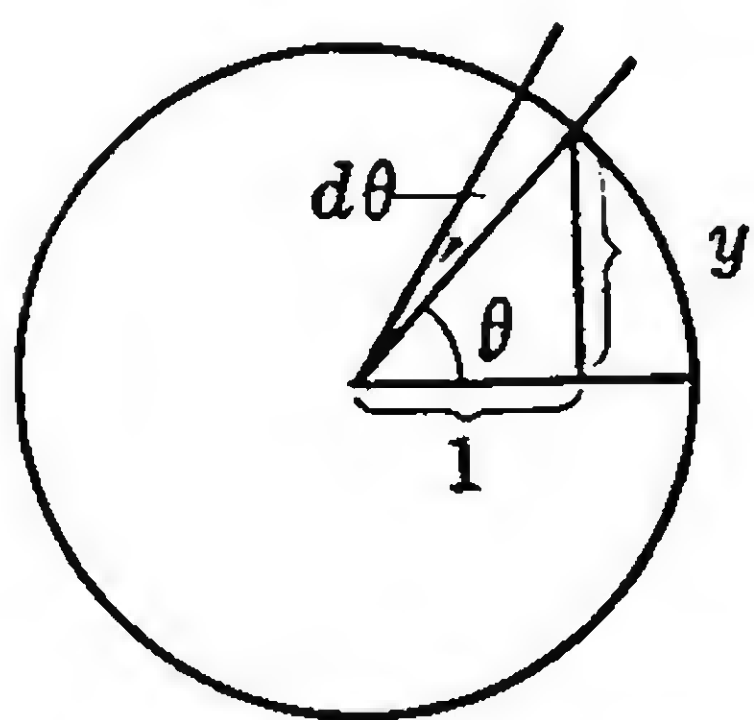

FIG. 79.—Geometry to find the derivative of  $\sin \theta$ .

But there is a trigonometric identity that can be written

$$\sin a - \sin b = 2 \cos \frac{a+b}{2} \cdot \sin \frac{a-b}{2}$$

Now, making  $a = \theta + d\theta$  and  $b = \theta$ , we get

$$\begin{aligned} dy &= 2 \cos \frac{\theta + d\theta + \theta}{2} \cdot \sin \frac{\theta + d\theta - \theta}{2} \\ &= 2 \cos \left( \theta + \frac{d\theta}{2} \right) \cdot \sin \frac{d\theta}{2} \end{aligned}$$

When  $d\theta$  is made to approach zero,  $\sin \frac{d\theta}{2} \rightarrow \frac{d\theta}{2}$ . Also, as  $d\theta \rightarrow 0$  the term  $\cos \left( \theta + \frac{d\theta}{2} \right) \rightarrow \cos \theta$ ; hence, the differential is

$$dy = 2 \cos \theta \cdot \frac{d\theta}{2} = \cos \theta \cdot d\theta \quad (22)$$

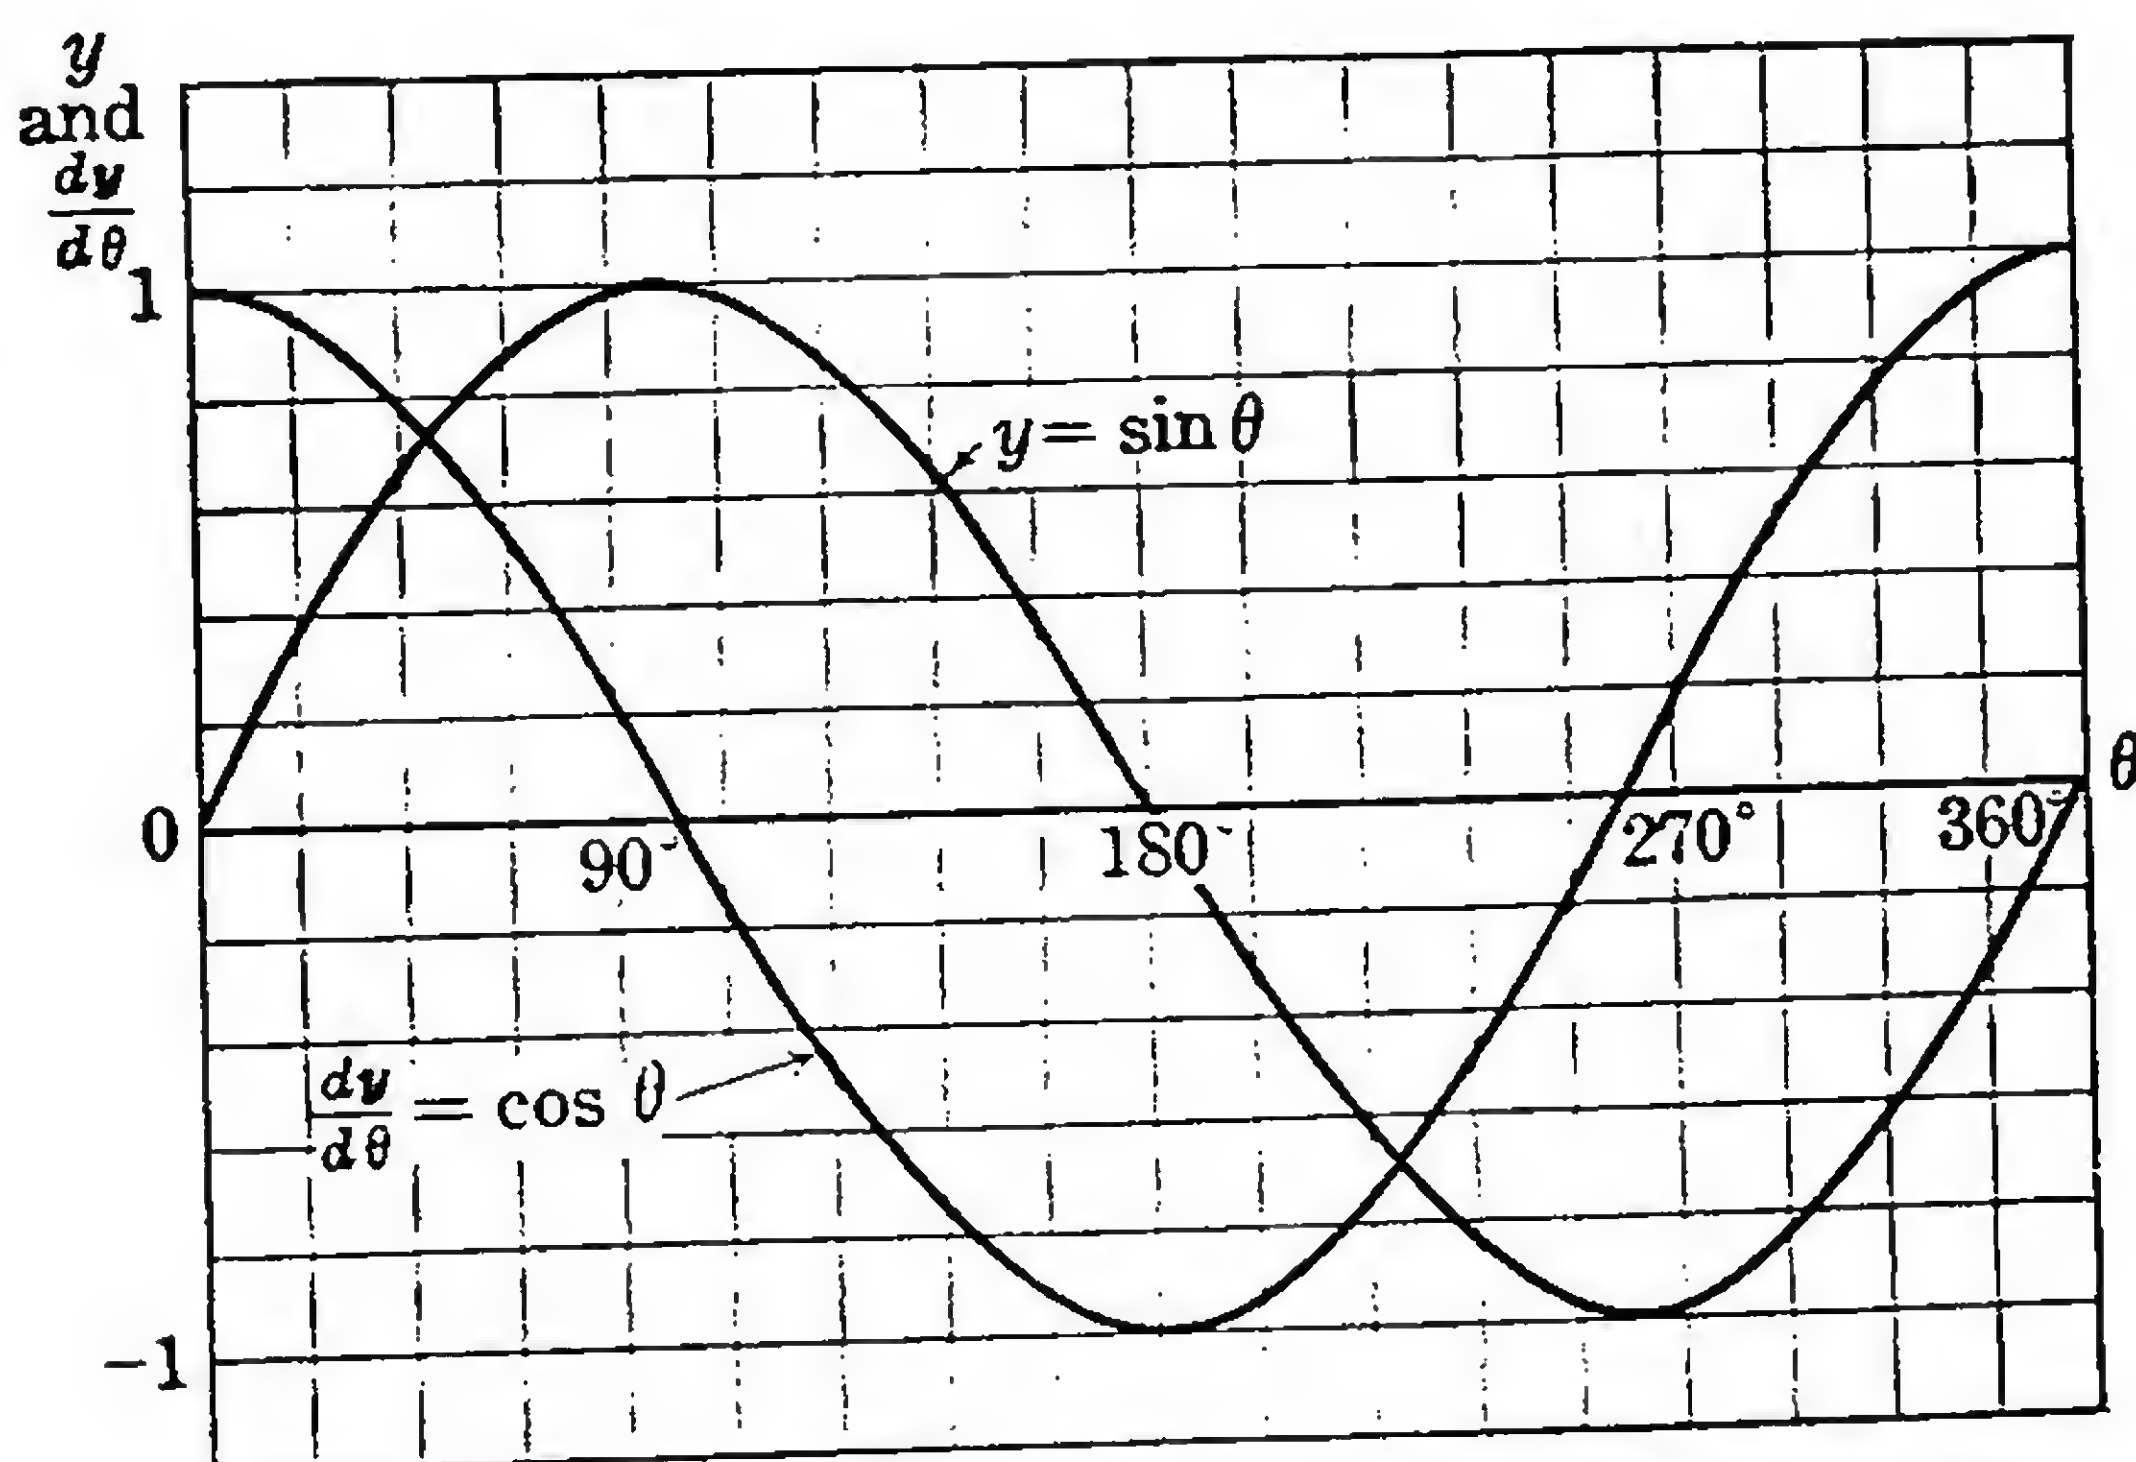

FIG. 80.—A sine curve and its derivative, a cosine curve.

The derivative of  $\sin \theta$  is therefore

$$\frac{d}{d\theta} (\sin \theta) = \cos \theta \quad (23)$$

The curve of  $\sin \theta$  with its derived curve  $\cos \theta$  is shown in Fig. 80.

*Example 7.* A sinusoidal voltage in a circuit can be expressed by the equation  $E = \sin \omega t$  where the constant  $\omega$  is the angular velocity of a vector and  $t$  is the time.

Determine the expression for the rate at which the voltage  $E$  changes with respect to time.

*Solution.* Applying the above procedure,

$$\begin{array}{l} \text{Subtracting} \quad \frac{E + dE}{E} = \frac{\sin(\omega t + \omega dt)}{\sin \omega t} \\ \text{Letting} \quad \frac{dE}{a = \omega t + \omega dt \text{ and } b = \omega t} = \frac{\sin(\omega t + \omega dt) - \sin \omega t}{\omega t + \omega dt - \omega t} \end{array}$$

and using trigonometric identities, we get

$$dE = 2 \cos \frac{\omega t + \omega dt + \omega t}{2} \cdot \sin \frac{\omega t + \omega dt - \omega t}{2}$$

In this expression the cosine term approaches  $\cos \omega t$  as  $dt \rightarrow 0$  and the sine term approaches  $\frac{\omega dt}{2}$  as  $dt \rightarrow 0$ .

$$dE = 2 \cos \omega t \cdot \frac{\omega dt}{2} = \omega \cos \omega t dt$$

Hence,

$$\frac{d}{d\theta} (\sin \omega t) = \omega \cos \omega t \quad \text{Ans.}$$

**Derivative of  $\cos \theta$ .**—Following a procedure similar to that used for finding the derivative of  $\sin \theta$ , we have

$$\begin{array}{l} \text{Subtracting} \quad \frac{y + dy}{y} = \frac{\cos(\theta + d\theta)}{\cos \theta} \\ \frac{dy}{d\theta} = \frac{\cos(\theta + d\theta) - \cos \theta}{\theta + d\theta - \theta} \end{array}$$

From the trigonometric identity,

$$\cos a - \cos b = -2 \sin \frac{a + b}{2} \cdot \sin \frac{a - b}{2}$$

let  $a = \theta + d\theta$  and  $b = \theta$ ; then

$$\begin{aligned} dy &= -2 \sin \frac{\theta + d\theta + \theta}{2} \cdot \sin \frac{\theta + d\theta - \theta}{2} \\ &= -2 \sin \left( \theta + \frac{d\theta}{2} \right) \cdot \sin \frac{d\theta}{2} \end{aligned}$$

Neglecting  $\frac{d\theta}{2}$  in comparison to  $\theta$  and making  $\sin \frac{d\theta}{2} \doteq \frac{d\theta}{2}$  result in

the differential

$$dy = -2 \sin \theta \frac{d\theta}{2} = -\sin \theta d\theta \quad (24)$$

The derivative of  $\cos \theta$  is therefore

$$(XII) \quad \frac{d}{d\theta} (\cos \theta) = -\sin \theta \quad (25)$$

**Successive Derivatives of  $\sin \theta$  and  $\cos \theta$ .**—By using Eqs. (23) and (25), it is possible to take successive derivatives of these functions, thus

Original function  $y = \sin \theta$

First derivative  $\frac{dy}{d\theta} = \cos \theta$

Second derivative  $\frac{d^2y}{d\theta^2} = -\sin \theta$

Third derivative  $\frac{d^3y}{d\theta^3} = -\cos \theta$

Fourth derivative  $\frac{d^4y}{d\theta^4} = \sin \theta$ , the original function

The second derivative of  $\sin \theta$  or  $\cos \theta$  is equal to the original function but of opposite sign.

*Example 8.* Find the values of  $y = \sin \theta$  when  $\sin \theta$  is a maximum and a minimum.

*Solution.* Setting the first derivative equal to zero gives the required values of  $\theta$ . Thus

$$\frac{dy}{d\theta} = \frac{d}{d\theta} (\sin \theta) = \cos \theta = 0$$

$\cos \theta$  is zero when  $\theta = 90^\circ$  and  $270^\circ$ . For these values of  $\theta$  the second derivative will indicate maximum or minimum values.

$$\frac{d^2y}{d\theta^2} = \frac{d}{d\theta} (\cos \theta) = -\sin \theta$$

When  $\theta = 90^\circ$ ,  $\frac{d^2y}{d\theta^2} = -1$ ; hence, a maximum.

When  $\theta = 270^\circ$ ,  $\frac{d^2y}{d\theta^2} = +1$ ; hence, a minimum.

The maximum value of  $y = \sin 90^\circ = +1$ . *Ans.*  
and the minimum value of  $y = \sin 270^\circ = -1$ . *Ans.*

**Derivative of  $\tan \theta$ .**—Let  $y = \tan \theta = \frac{\sin \theta}{\cos \theta}$

Using the formula for finding the derivative of a fraction,

$$\begin{aligned}\frac{dy}{d\theta} &= \frac{\cos \theta \frac{d}{d\theta} (\sin \theta) - \sin \theta \frac{d}{d\theta} (\cos \theta)}{\cos^2 \theta} \\ &= \frac{\cos^2 \theta + \sin^2 \theta}{\cos^2 \theta} = \frac{1}{\cos^2 \theta} = \sec^2 \theta\end{aligned}$$

Therefore,

$$(XIII) \quad \frac{d}{d\theta} (\tan \theta) = \sec^2 \theta \quad (26)$$

**Derivative of  $\sinh \theta$ .**—Let  $y = \sinh \theta$ . Resorting to the basic idea of increasing each variable a little bit gives

$$\begin{array}{rcl} \text{Subtracting} & y + dy = \sinh(\theta + d\theta) & \\ & y = \sinh \theta & \\ & \frac{dy}{d\theta} = \frac{\sinh(\theta + d\theta) - \sinh \theta}{d\theta} & \end{array}$$

Now let  $a = \theta + d\theta$  and  $b = \theta$

From the hyperbolic function identity,

$$\begin{aligned}\sinh a - \sinh b &= 2 \cosh \frac{a+b}{2} \cdot \sinh \frac{a-b}{2} \\ dy &= 2 \cosh \frac{\theta + d\theta + \theta}{2} \cdot \sinh \frac{\theta + d\theta - \theta}{2}\end{aligned}$$

But for small values of  $d\theta$ ,  $\sinh \frac{d\theta}{2} \doteq \frac{d\theta}{2}$  and  $\frac{d\theta}{2}$  can be neglected in comparison to  $\theta$ , to give the differential

$$dy = 2 \cosh \theta \frac{d\theta}{2} = \cosh \theta d\theta \quad (27)$$

Hence, the derivative is

$$(XIV) \quad \frac{d}{d\theta} (\sinh \theta) = \cosh \theta \quad (28)$$

**Example 9.** By the use of exponentials find the derivative of  $\sinh \theta$ .

$$\text{Solution. } y = \sinh \theta = \frac{e^\theta - e^{-\theta}}{2}$$

By Eq. (15) and Example 2 or using Eq. (17),

$$\frac{dy}{d\theta} = \frac{e^\theta + e^{-\theta}}{2} = \cosh \theta \quad \text{Ans.}$$

This method is much easier than using the basic idea as it was given in the development.

**Derivative of cosh  $\theta$ .—**Let

$$\begin{aligned} y &= \cosh \theta \\ \text{Then } y + dy &= \cosh (\theta + d\theta) \end{aligned}$$

and subtracting the original function gives

$$dy = \cosh (\theta + d\theta) - \cosh \theta$$

Let  $a = \theta + d\theta$  and  $b = \theta$  in the hyperbolic identity

$$\cosh a - \cosh b = 2 \sinh \frac{a+b}{2} \cdot \sinh \frac{a-b}{2}$$

$$\text{Hence, } dy = 2 \sinh \frac{\theta + d\theta + \theta}{2} \cdot \sinh \frac{\theta + d\theta - \theta}{2}$$

Neglecting  $\frac{d\theta}{2}$  in the first sinh and letting  $\sinh \frac{d\theta}{2} \doteq \frac{d\theta}{2}$  in the second sinh results in the differential

$$dy = 2 \sinh \theta \cdot \frac{d\theta}{2} = \sinh \theta d\theta \quad (29)$$

and the derivative is

$$(XV) \quad \frac{d}{d\theta} (\cosh \theta) = \sinh \theta \quad (30)$$

**Successive Derivatives of sinh  $\theta$  and cosh  $\theta$ .—**By using Eqs. (28) and (30), the successive derivatives of these functions are

Original equation  $y = \sinh \theta$

First derivative  $\frac{dy}{d\theta} = \cosh \theta$

Second derivative  $\frac{d^2y}{d\theta^2} = \sinh \theta$ , the original function

Third derivative  $\frac{d^3y}{d\theta^3} = \cosh \theta$ , the first derivative

This shows that the second and third derivatives of sinh  $\theta$  and cosh  $\theta$  repeat the original function and first derivatives.

**Derivative of  $\tanh \theta$ .**—Taking the derivative of the fraction

$$y = \tanh \theta = \frac{\sinh \theta}{\cosh \theta}$$

$$\frac{dy}{d\theta} = \frac{\cosh \theta \frac{d}{d\theta} (\sinh \theta) - \sinh \theta \frac{d}{d\theta} (\cosh \theta)}{\cosh^2 \theta}$$

$$= \frac{\cosh^2 \theta - \sinh^2 \theta}{\cosh^2 \theta} = \frac{1}{\cosh^2 \theta} = \operatorname{sech}^2 \theta$$

Hence,

$$(XVI) \quad \frac{d}{d\theta} (\tanh \theta) = \operatorname{sech}^2 \theta \quad (31)$$

**Partial Derivatives.**—In many engineering problems the value of the dependent variable depends upon more than one independent variable. In such cases, the common practice is to treat all but one of the variables as constants. As a concrete illustration, the area  $A$  of a rectangle is the product of the length of the two sides  $x$  and  $y$ , thus

$$A = xy \quad (32)$$

The area depends upon the length of the two sides. As suggested above, if one side, say  $x$ , is held constant, the rate of area change can be written in differential form, thus

$$dA_x = x dy \quad (33)$$

where the  $x$  subscript to  $A$  means that  $x$  is held constant during this operation.

Similarly, if  $y$  is held constant the differential change in area is

$$dA_y = y dx \quad (34)$$

Another common way to make this statement is by using partial derivative signs ( $\partial$ ), thus

$$\frac{\partial A}{\partial y} = x \quad (35)$$

This says that partial of  $A$  by partial of  $y$  is equal to  $x$  for this illustration. When partial derivative signs are used, only those terms to which the partial is applied are permitted to vary.

Similarly,

$$\frac{\partial A}{\partial x} = y \quad (36)$$

means that all terms by  $A$  and  $x$  are held constant during this operation.

The total differential of the area  $A$  is the sum of the differential when  $x$  is held constant plus the differential when  $y$  is held constant, thus

$$dA = dA_x + dA_y \quad (37)$$

Substituting for  $dA_x$  and  $dA_y$  from the above equations gives the *total differential* of  $A$

$$dA = x dy + y dx \quad (38)$$

Now if the area changes size at a given rate of time, we can divide both sides of this equation by  $dt$  to get

$$\frac{dA}{dt} = x \frac{dy}{dt} = y \frac{dx}{dt} \quad (39)$$

But, as given above,  $x$  and  $y$  can be replaced by the respective partial derivatives to get

$$\frac{dA}{dt} = \frac{\partial A}{\partial y} \frac{dy}{dt} + \frac{\partial A}{\partial x} \frac{dx}{dt} \quad (40)$$

This is the *total derivative* of  $A$ .

*Example 10.* The volume of a cylinder is given by the expression

$$V = \pi r^2 h$$

where  $V$  = volume in cubic inches.

$r$  = radius in inches.

$h$  = height in inches.

At a particular instant  $r = 10$  in. and is increasing 2 in. per sec, while at this same instant  $h = 20$  in. and is increasing 0.5 in. per sec. Determine the rate at which the volume is changing.

$$\text{Solution. } \frac{\partial V}{\partial r} = 2\pi r h$$

$$\frac{\partial V}{\partial h} = \pi r^2$$

Substituting these values in Eq. (40) gives

$$\frac{dV}{dt} = 2\pi r h \frac{dr}{dt} + \pi r^2 \frac{dh}{dt}$$

Substituting the values given in the problem,

$$\begin{aligned} \frac{dV}{dt} &= 2(3.1416)(10)(20)(2) + (3.1416)(100)(0.5) \\ &= 2513.28 + 157.08 = 2670.36 \text{ cu in. per sec. } \text{Ans.} \end{aligned}$$

**Summary.**

1. The natural growth curve is given by the exponential series,

$$y = e^x = 1 + x + \frac{x^2}{2} + \frac{x^3}{3} + \dots$$

When  $x = 1$ ,  $y = e = 2.71828 \dots$  the natural growth number  $e$ .

2. The natural decay curve is given by the exponential series,

$$y = e^{-x} = 1 - x + \frac{x^2}{2} - \frac{x^3}{3} + \dots$$

When  $x = 1$ ,  $y = e^{-1} = 1/e = 0.36788 \dots$  the natural decay number  $1/e$ .

3. Conversion equations for natural and common logarithms:

$$\begin{aligned} \log x &= \log e \ln x = 0.4343 \ln x \\ \ln x &= \ln 10 \log x = 2.303 \log x \end{aligned}$$

4. Transcendental differential formulas:

$$(VIII) \quad \frac{d}{dx} (e^x) = e^x$$

$$(IX) \quad \frac{d}{dx} (e^{ax}) = ae^{ax}$$

$$(X) \quad \frac{d}{dx} (\ln x) = \frac{1}{x}$$

$$(XI) \quad \frac{d}{d\theta} (\sin \theta) = \cos \theta$$

$$(XII) \quad \frac{d}{d\theta} (\cos \theta) = -\sin \theta$$

$$(XIII) \quad \frac{d}{d\theta} (\tan \theta) = \sec^2 \theta$$

$$(XIV) \quad \frac{d}{d\theta} (\sinh \theta) = \cosh \theta$$

$$(XV) \quad \frac{d}{d\theta} (\cosh \theta) = \sinh \theta$$

$$(XVI) \quad \frac{d}{d\theta} (\tanh \theta) = \operatorname{sech}^2 \theta$$

5. The second derivatives of  $\sin$  and  $\cos$  functions produce the original function but with the opposite sign.

6. The second derivatives of  $\sinh$  and  $\cosh$  functions produce the original function with the same sign.

7. Partial derivatives are useful in treating engineering problems having more than one independent variable.

### Exercises

1. Determine the value of  $e^x$  to five decimal places when  $x = 2$ .
2. Find the derivative of  $y = e^{\alpha x + \beta x}$ .
3. Find the derivative of  $y = \ln x^2$ .
4. Find the derivative of  $y = \sin x = \frac{e^{jx} - e^{-jx}}{2j}$  by using exponentials.
5. Find the natural logarithm of 8 and then convert to find the common logarithm.
6. In an electrical circuit, the voltage

$$E = L \frac{di}{dt}$$

Where  $i = I \sin \omega t$ , determine the value of the voltage  $E$ .

7. Find the derivative of  $y = \cos^2 \theta$ .
8. Find the derivative of  $y = \cot \theta = \frac{\cos \theta}{\sin \theta}$ .
9. What is the second derivative of  $y = \cosh \alpha x$ ?
10. Find the maximum or minimum of the function  $F = x + 2xy + y$ .

## CHAPTER 14

### INTEGRAL CALCULUS

The word "integral" means the whole or sum of all the little bits. Therefore, *integral calculus* is the mathematics of calculating the sum of all the little bits. The integral sign  $\int$ , as already explained, is an elongated letter S, meaning "the sum of." Mathematicians usually prefer to read this sign "the integral of." Thus,  $\int dx$  means the sum of all the little bits of  $x$  but is usually read "the integral of  $dx$ ." It may be written in the form of an integral equation, thus

$$y = \int dx \quad (1)$$

This equation states that  $y$  is equal to the sum of a vast number of very small quantities  $dx$ . In fact, these  $dx$  quantities are so indefinitely small that it requires the sum of an indefinitely large number of them to make up the total or integral quantity  $y$ .

The integral sign is quite closely related to the summation sign  $\Sigma$  (the Greek letter sigma). The basic difference is that  $\Sigma$  stands for the sum of a few or finite number of terms, while  $\int$  stands for the sum of an indefinitely large number or infinite number of terms. It may be written in the form of a *summation equation*, thus

$$y = \Sigma y_k \quad (2)$$

where  $y$  is the sum of all the  $y_k$  terms that are to be added together.

Integration as used in integral calculus can be thought of as the inverse operation of differentiation as used in differential calculus. This can be compared to division as the inverse operation of multiplication. Integration is more difficult than differentiation, much as division is more difficult than multiplication. In general, integration of a variable cannot be performed unless the variable has already been found by the process of differentiation. For differentiation, the symbol of operation is  $\frac{d}{dx}$  ( ) where the quantity to be operated on is

placed between the parentheses. The symbol of operation for integration is  $\int ( ) dx$  where the quantity to be operated on is placed between the parentheses.

In this chapter we shall deal with several practical ways of making approximate sums. Then some of the integral formulas obtained directly from differentiation will be treated so that, in simple cases, it will be possible to find the exact sums.

**Trapezoidal Rule.**—The area enclosed by a curve can be approximated by dividing the area with a number of evenly spaced parallel lines and then adding together the area of each of

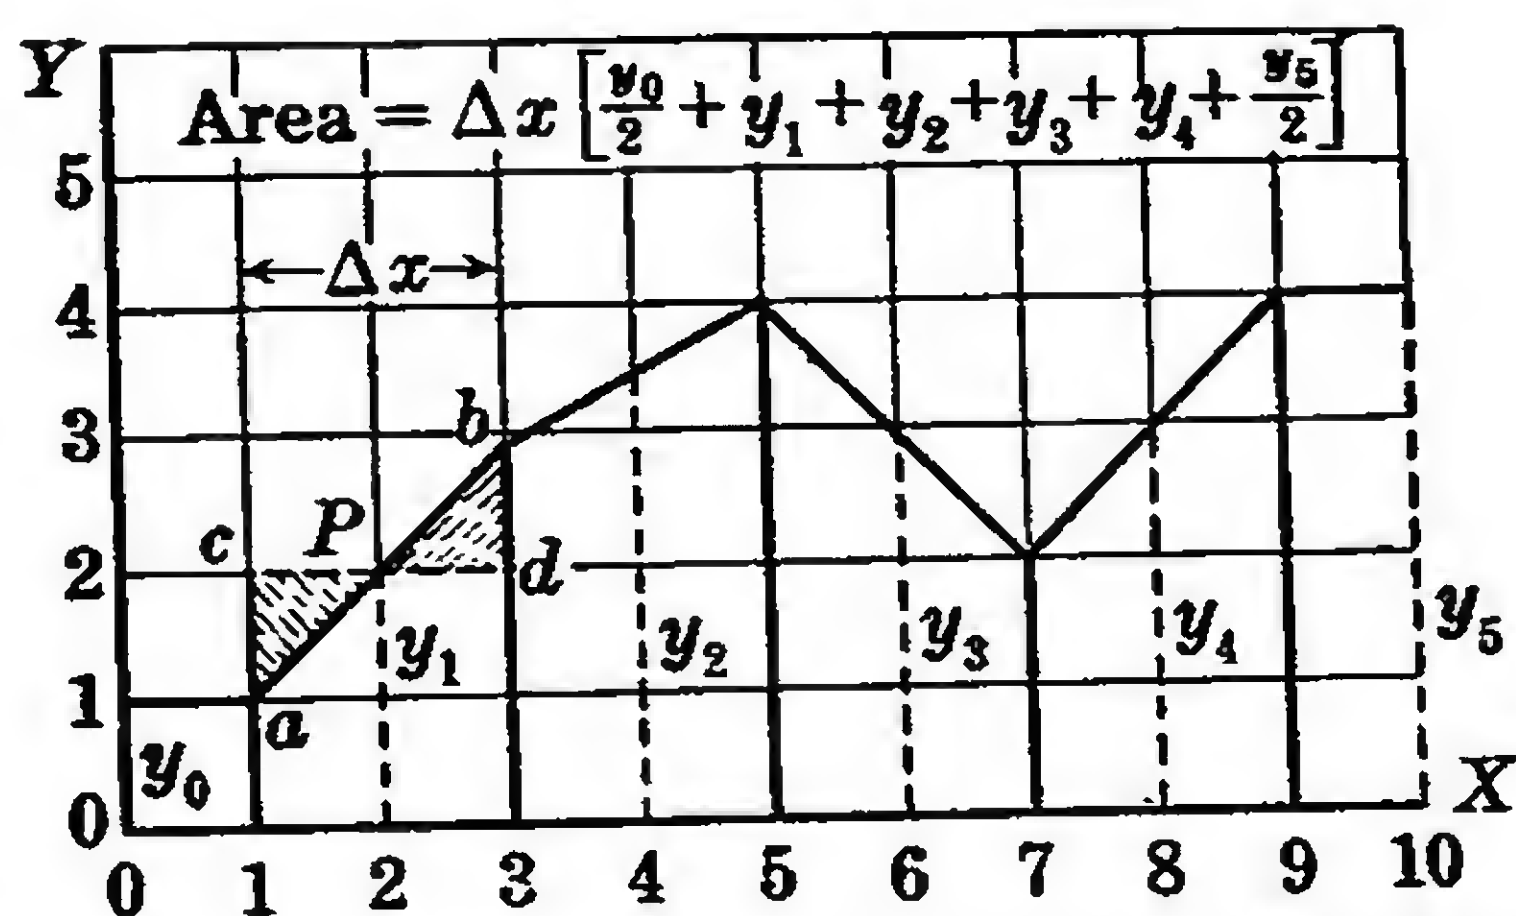

FIG. 81.—Area measured by the trapezoidal rule.

these individual strips. For illustration, it is desired to measure the area under the curve, that is, between the curve and the  $x$ -axis from ordinate  $y_0$  to ordinate  $y_5$  as shown in Fig. 81. First, consider the area of the trapezoid  $a, P, b, 3, 1$ , which is a strip of width  $\Delta x$  and of average height  $y_1$ . Since the area in the shaded triangle  $acP$  above the curve is equal to the shaded triangle  $Pbd$  below the curve, the area of the trapezoid  $aP, b, 3, 1$  is the same as the area of the rectangle  $c, d, 3, 1$  which is equal to  $(\Delta x)y_1$ . The area under the curve from  $x = 3$  to  $x = 9$  can be measured in this fashion and is equal to  $(\Delta x)(y_2 + y_3 + y_4)$ . The area of the end strips, which are one half the width of the other strips, is equal to  $\left(\frac{\Delta x}{2}\right)y_0$  and  $\left(\frac{\Delta x}{2}\right)y_5$ . The total area in this case therefore, is,

$$A = \Delta x \left( \frac{y_0}{2} + y_1 + y_2 + y_3 + y_4 + \frac{y_5}{2} \right)$$

In general, this equation can be written

$$A = \Delta x \left( \frac{1}{2} (y_0 + y_n) + y_1 + y_2 + \cdots + y_{n-1} \right) \quad (3)$$

where  $A$  = approximate total area.

$\Delta x$  = width of strips.

$y$  = height of strips.

$n$  = number of strips.

By using the summation sign this same equation can be expressed as follows:

$$A = \Delta x \left[ \frac{1}{2} (y_0 + y_n) + \sum_{k=1}^{k=n-1} y_k \right] \quad (4)$$

where the summation sign  $\sum_{k=1}^{k=n-1}$  is read "the summation of all the  $y_k$  terms from  $k = 1$  to  $k = n - 1$ ." In words Eqs. (3) and (4) can be written

$$\left( \begin{array}{c} \text{Approximate} \\ \text{total area} \end{array} \right) = \left( \begin{array}{c} \text{width} \\ \text{of} \\ \text{strip} \end{array} \right) \left( \begin{array}{c} \text{sum of} \\ \text{extreme} \\ \text{ordinates} \\ \hline 2 \end{array} + \begin{array}{c} \text{sum of} \\ \text{remaining} \\ \text{ordinates} \end{array} \right) \quad (5)$$

The trapezoidal rule as expressed by these three equations assumes that the curve is a straight line across the top of each strip. If this is not so, the answer will approximate the total area. The accuracy of this approximation will increase if the number of strips for a given area are increased. The answer can, therefore, be made as accurate as you desire providing you are willing to do the extra work of adding the increased number of strips.

*Example 1.* If the scales in Fig. 81 are measured in inches, what is the area under the curve?

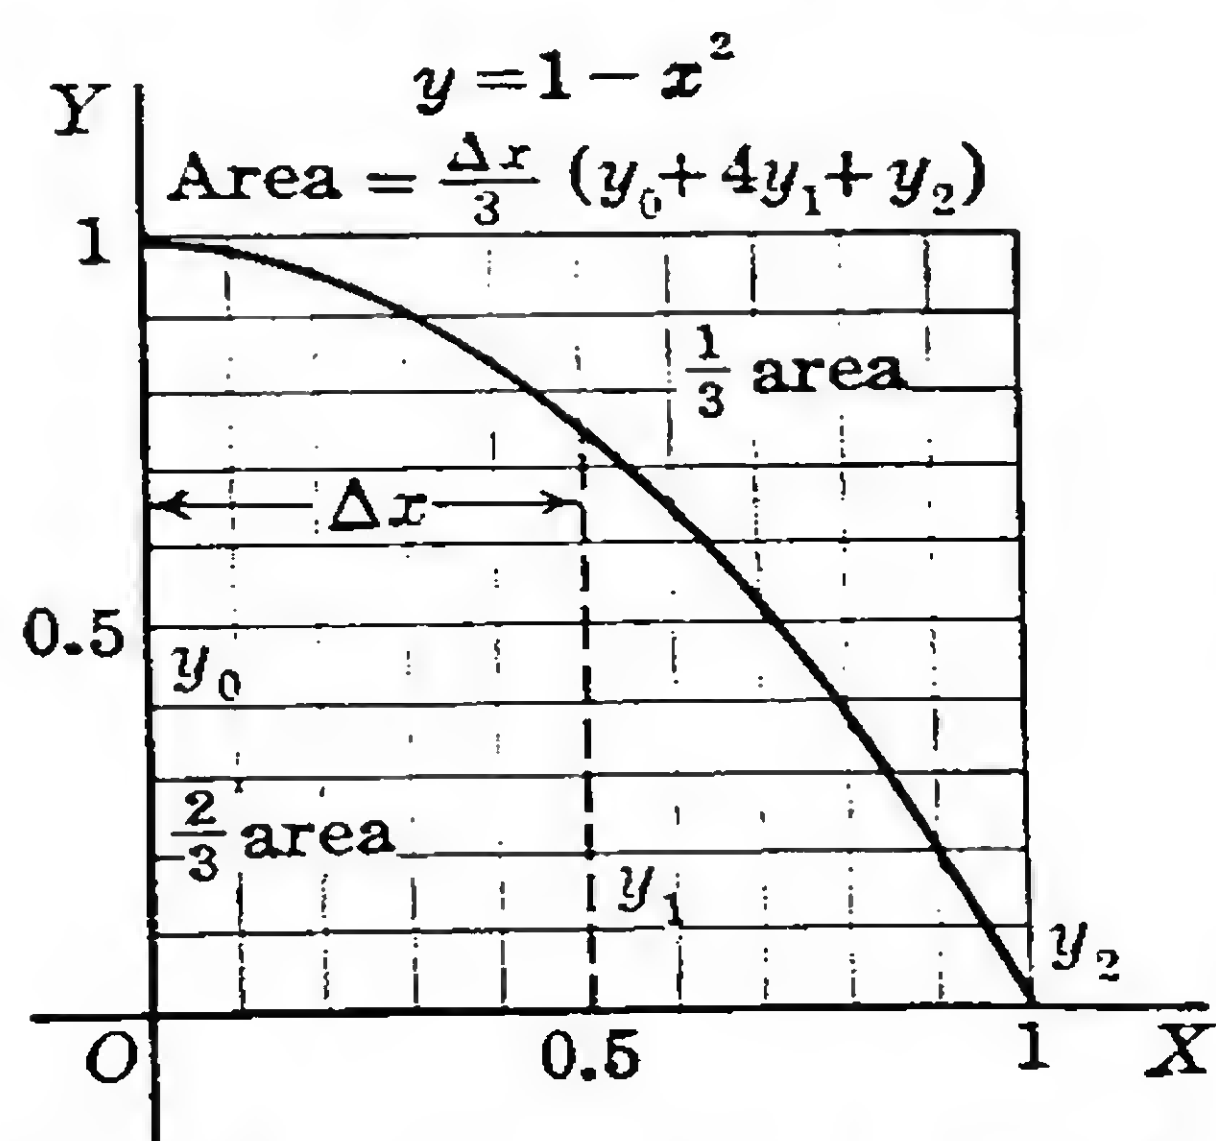

*Solution.* Substituting values in Eq. (4)

$$A = 2\left[\frac{1}{2}(1 + 4) + 2 + 3.5 + 3 + 3\right] = 28 \text{ sq in.} \quad \text{Ans.}$$

This can be checked by counting the squares.

**Simpson's Rule.**—Simpson's rule assumes that the curve between any three consecutive points is a parabola. This in general gives a better approximation than assuming that adjacent points are connected by a straight line as was done in the trapezoidal rule. This is due to the fact that if the points are chosen reasonably close together, the portion of the parabola between these points will practically coincide with any reasonable curve drawn through the points.

The area under any portion of a parabola is exactly  $\frac{2}{3}$  of the enclosing rectangle as illustrated in Fig. 82. The area under any three points on a parabola is given by

$$\text{Area} = \frac{1}{3} \Delta x (y_0 + 4y_1 + y_2)$$

If these are the first three points giving the area in the first two strips, then the area in the second two strips is

$$\text{Area} = \frac{1}{3} \Delta x (y_2 + 4y_3 + y_4)$$

FIG. 82.—Area under a parabola measured by Simpson's rule.

In general, these areas can be added together to give the total

area under the curve, thus

$$A = \frac{1}{3} \Delta x (y_0 + 4y_1 + 2y_2 + 4y_3 + 2y_4 + \cdots + y_n) \quad (6)$$

where  $A$  = approximate total area.

$\Delta x$  = width of strips.

$y$  = height of strips.

$n$  = number of strips ( $n$  being even).

Equation (6) may be expressed by using the summation sign, as follows:

$$A = \frac{\Delta x}{3} \left[ (y_0 + y_n) + 4 \sum_{k=1}^{n/2} y_{(2k-1)} + 2 \sum_{k=1}^{n/2-1} y_{2k} \right] \quad (7)$$

In words, this equation can be expressed

$$A = \frac{1}{3} \left[ \begin{array}{c} \text{width} \\ \text{of} \\ \text{strip} \end{array} \right] \left[ \begin{array}{c} \left( \begin{array}{c} \text{sum of extreme} \\ \text{ordinates} \end{array} \right) + 4 \left( \begin{array}{c} \text{sum of remaining} \\ \text{odd-numbered} \\ \text{ordinates} \end{array} \right) \\ + 2 \left( \begin{array}{c} \text{sum of remaining} \\ \text{even-numbered} \\ \text{ordinates} \end{array} \right) \end{array} \right] \quad (8)$$

*Example 2.* Determine the area under the parabola of Fig. 82 if the scales are in inches.

**Solution.** Substituting in Eq. (6),

$$A = \frac{1}{3} (0.5) [1 + 4(0.75) + 0] = \frac{1}{6} (1 + 3) = \frac{2}{3} \text{ sq in. } \text{Ans.}$$

**Example 3.** If  $n = 8$ , write out the summation quantities in Eq. (7) and then express the whole equation.

$$\begin{aligned} \sum_{k=1}^{k=\frac{8}{2}=4} y_{(2k-1)} &= y_{(2 \cdot 1 - 1)} + y_{(2 \cdot 2 - 1)} + y_{(2 \cdot 3 - 1)} + y_{(2 \cdot 4 - 1)} \\ &= y_1 + y_3 + y_5 + y_7 \quad \text{Ans.} \\ \sum_{k=1}^{k=\frac{8}{2}-1=3} y_{2k} &= y_{2 \cdot 1} + y_{2 \cdot 2} + y_{2 \cdot 3} \\ &= y_2 + y_4 + y_6 \quad \text{Ans.} \end{aligned}$$

$$A = \frac{\Delta x}{3} ((y_0 + y_8) + 4(y_1 + y_3 + y_5 + y_7) + 2(y_2 + y_4 + y_6)) \quad \text{Ans.}$$

**Area Integration.**—The trapezoidal rule gives a roughly approximate area, while Simpson's rule gives a more accurate approximation. The next step is to find the exact area by using integral calculus. This can be done by using the integral equation

$$A = \int_a^b y \cdot dx \quad (9)$$

where,  $A$  = the exact area.

$y$  = the ordinate or height of infinitesimal strip.

$dx$  = width of infinitesimal strip.

This equation says that the area under the curve from  $x = a$  to  $x = b$  is the sum of all the infinitesimal areas which are  $y \, dx$ . Referring to Fig. 78, the infinitesimal area  $y \cdot dx$  has a height of  $y$  and a width of  $dx$ . Substituting the limits  $a = 2$  and  $b = 6$ , and the value of  $y = 4$ , Eq. (9) becomes

$$A = \int_{x=2}^{x=6} 4 \, dx$$

The constant 4 can be moved outside the integral sign without altering the value of the equation, thus

$$A = 4 \int_{x=2}^{x=6} dx \quad (10)$$

Now, the integral of  $dx$  must be a function of  $x$  such that when  $x = 2$  is substituted the area from  $x = 0$  to  $x = 2$  is given by the

equation. Let us make a guess and assume that the integral of  $dx$  is  $x$ . Now when  $x = 2$ , the area  $A = 4 \cdot 2 = 8$  which checks the area under the curve up to this point. Next substitute the value of  $x = 6$  to get  $A = 4 \cdot 6 = 24$  which checks the area under the curve up to this final point. This shows that our guess was correct, so integrating Eq. (10) results in

$$A = 4x \Big|_a^b = 4x \Big|_{x=2}^{x=6} \quad (11)$$

which says that the lower value  $x = 2$  is substituted in the equation to give the area under the curve up to the point of interest. The upper value  $x = 6$  will give the above area plus

the area of interest so we subtract the above area from the total area to get the area of interest, thus

$$A = 4 \cdot 6 - 4 \cdot 2 = 24 - 8 = 16 \quad \text{Ans.}$$

This answer gives the area under the curve from  $x = 2$  to  $x = 6$  as shown in Fig. 83.

Integral calculus enables us to get the exact area under any curve that

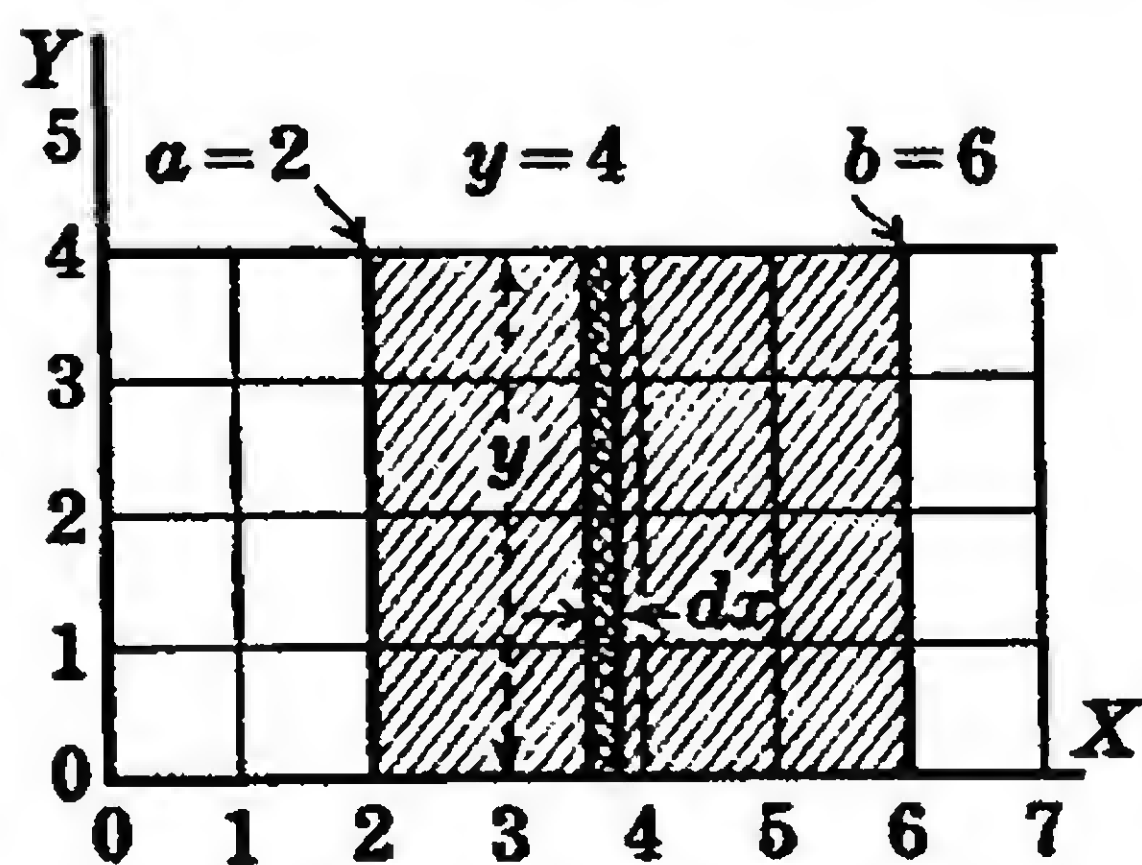

FIG. 83.—Integration of the constant  $y = 4$  between the limits  $a = 2$  and  $b = 6$ .

we can integrate. Without it we would have to satisfy ourselves with approximate results or perform an infinite number of operations. Now that we see the usefulness of this new tool let us learn how to integrate.

**Example 4.** Find the area under the curve  $y = 2$  from  $a = 1$  to  $b = 4$ .

**Solution.** By Eq. (9),

$$A = \int_1^4 2 \, dx = 2 \int_1^4 dx = 2x \Big|_1^4 = 2 \cdot 4 - 2 \cdot 1 = 6 \quad \text{Ans.}$$

**Infinitesimals.**—In order to get an exact answer, integration is used to add the infinite number of infinitesimal quantities making up the variable. Thus,  $dx$  is an infinitesimal part of the variable  $x$ . Or in other words,  $x$  is the integral sum of all the infinitesimal  $dx$  quantities in the variable  $x$ .

This can be visualized by considering a simple case. A bug walking down a string goes 1 inch the first minute, the second minute he goes  $\frac{1}{2}$  inch, the third minute, he goes  $\frac{1}{4}$  inch, and thus each succeeding minute he travels just one half as far as he

did the previous minute. How far will he travel if the time is increased without limit? The answer is 2 inches as shown in Fig. 84, because each minute the bug goes halfway to the final value of 2 inches.

Furthermore, the bug always has as far to travel as he went during the last minute. During the first minute he went 1 inch, which is halfway to the 2-inch mark. The second minute he went  $\frac{1}{2}$  inch farther, leaving  $\frac{1}{2}$  inch yet to go. During the

FIG. 84.—Graphical representation of the geometric series  
 $S_n = 1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \dots$

third minute, he went  $\frac{1}{4}$  inch farther, leaving  $\frac{1}{4}$  inch yet to go. The bug can spend as much time as you can think of and he will not be to the limiting value of 2 inches. However, if he could perform this operation an infinite number of times, the value of 2 inches would actually be reached. The last space covered in doing this an infinite number of times would be infinitesimally small. So it is no wonder that an integral will give an exact answer, since it evaluates an infinite number of infinitesimally small quantities.

*Example 5.* Find the ultimate sum of

$$S_n = \frac{2}{3} + \frac{1}{3} + \frac{1}{6} + \frac{1}{12} + \frac{1}{24} + \dots$$

*Solution.* From this series we see that the first space covered is  $\frac{2}{3}$ ; the next space covered is  $\frac{1}{2}$  of this value or  $\frac{1}{3}$ . Since each succeeding step covers  $\frac{1}{2}$  the previous distance, then the remaining distance must be equal to the distance covered in the last step. Hence, the ultimate sum of

$$S_n = \frac{2}{3} + \frac{2}{3} = 1 \frac{1}{3} \text{ Ans.}$$

**Constant of Integration.**—Differentiation can be visualized as the process of finding the slope of a curve. Then, integration, the reverse process, can be visualized as the process of finding a curve when the slope is given. But knowing the slope is not enough information to locate a single curve. In fact, many reverse processes do not give a definite result as does the first process. For illustration,  $2^2 = 4$  which is definite but  $\sqrt{4}$  is

either  $+2$  or  $-2$ . Consider the equation of a horizontal line

$$y = C$$

The derivative or slope of this line is

$$\frac{dy}{dx} = 0$$

Referring to the family of curves in Fig. 85, we see that they all have a zero slope. Hence with the information of a zero slope,

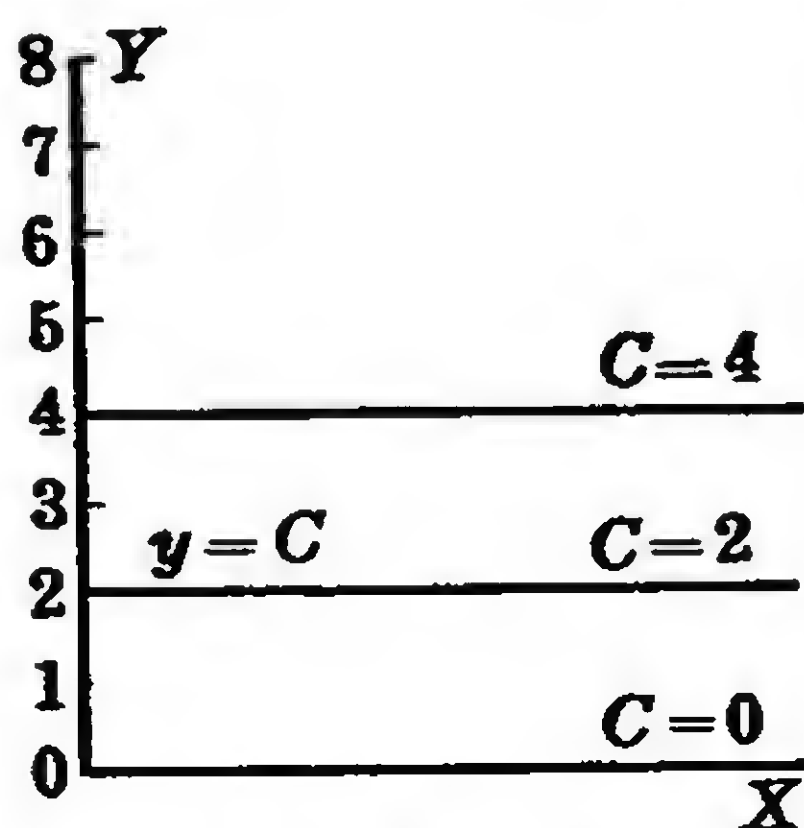

FIG. 85.—A family of lines with the same zero slope.

we know only that the line is horizontal; to locate it, we must know its distance from the  $x$ -axis. This distance can be represented by  $C$ , the distance to the curve along the  $y$ -axis. This means that *to every quantity that is integrated a constant must be added to locate the curve.* This constant may be zero or some other value.

**Algebraic Integrals.**—In the treatment that is to follow each algebraic integral equation will be given along with a brief proof, some graphical representation, and typical examples.

$$(I) \quad \int 0 \cdot dx = C \quad (12)$$

This equation merely says that the integral of any quantity, even of zero, must have a constant added to locate the curve. In other words, at any value of  $x$  the value of  $y = C$  as shown in Fig. 85.

$$(II) \quad \int 1 \cdot dx = x + C \quad (13)$$

Consider the equation  $y = x + C$  as shown in Fig. 86 for three values of  $C$ . Taking the differential of both sides of this equation gives

$$dy = dx$$

It will be noted that the constant  $C$  was lost in this operation, so in reversing the operation, the constant must be added. Now taking the integral of both sides gives

$$y = \int dy = \int dx = x + C$$

which proves Eq. (13) and says that *the integral of  $dx$  is equal to  $x + C$* . The slope is determined by the coefficient of  $x$ , which in this case is one, and the constant  $C$  determines where the line crosses the  $y$ -axis.

*Example 6.* When the slope of a line is  $-1$ , give the integral equation.

*Solution.* This statement can be written

$$\frac{dy}{dx} = -1$$

or, in differential equation form,  $dy = -1 dx$ .

Taking the integral of both sides,

$$y = \int dy = \int -1 dx = -x + C \quad \text{Ans.}$$

$$(III) \quad \int a dx = ax + C \quad (14)$$

Consider the equation  $y = ax + C$  as shown in Fig. 87 for two different values of the slope  $a$  and two different values of

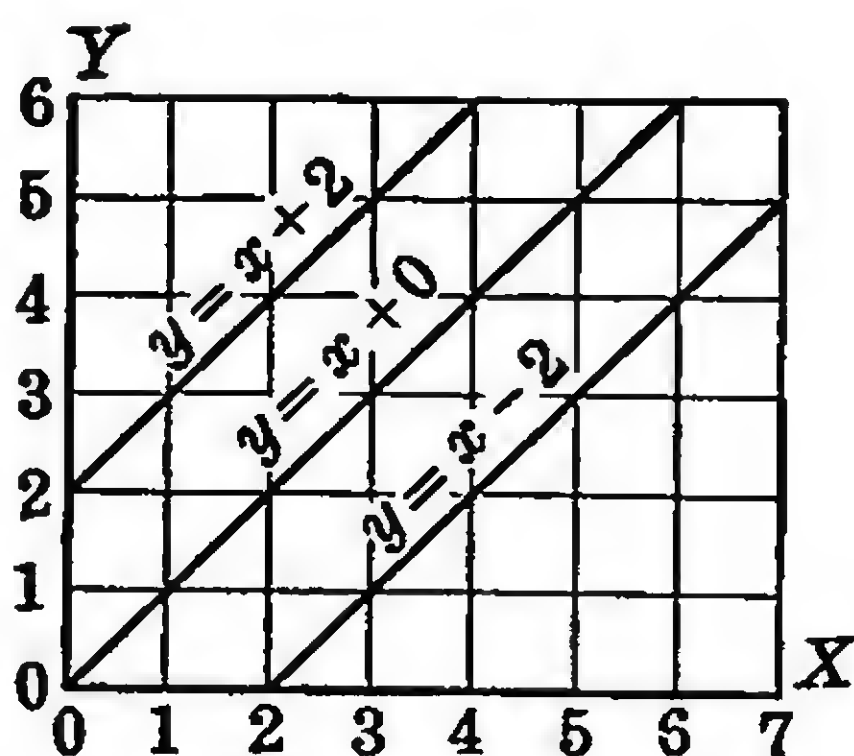

FIG. 86.—A family of lines with the same unity slope.

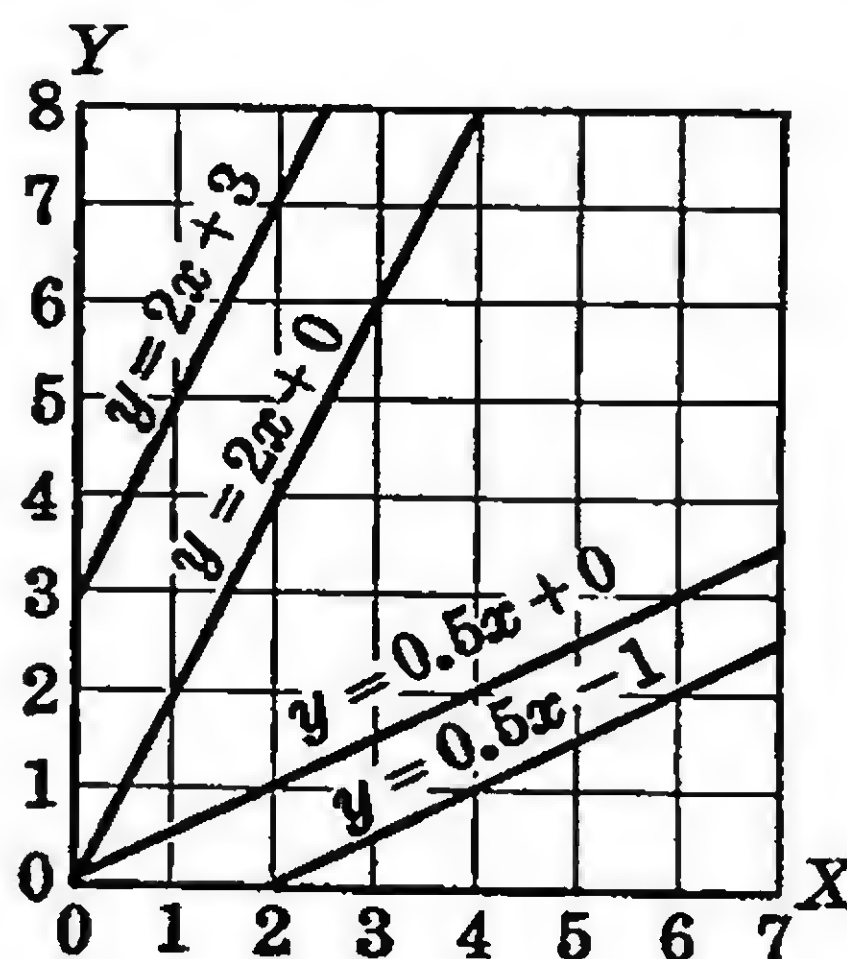

FIG. 87.—Two families of curves having different slopes.

the constant  $C$ , which gives the point at which the curve intersects the  $y$ -axis. The differential equation is

$$dy = a dx$$

and the integral of this equation is

$$y = \int dy = \int a dx = ax + C$$

Thus the integral of the product  $a dx$  is  $ax + C$ .

*Example 7.* What is the integral of  $\frac{1}{a} dx$ ?

*Solution.* By Eq. (14),

$$\int \frac{1}{a} dx = \frac{x}{a} + C \quad \text{Ans.}$$

*Example 8.* An automobile has a velocity of  $v = 10$  mph. If the mileage indicator already reads 20 miles, integrate to find what the reading will be after 3 hr and show the results graphically.

*Solution.* The differential equation is  $ds = v dt$

Taking the integral of both sides, the space covered is given by

$$S = \int ds = \int v dt = vt + C$$

Now the velocity  $v = 10$  mph, the time  $t = 3$  hr and the constant  $C = 20$  miles already traveled, hence the speedometer reading will be

$$S = 10 \cdot 3 + 20 = 50 \text{ miles} \quad \text{Ans.}$$

See Fig. 88 for graphical representation.

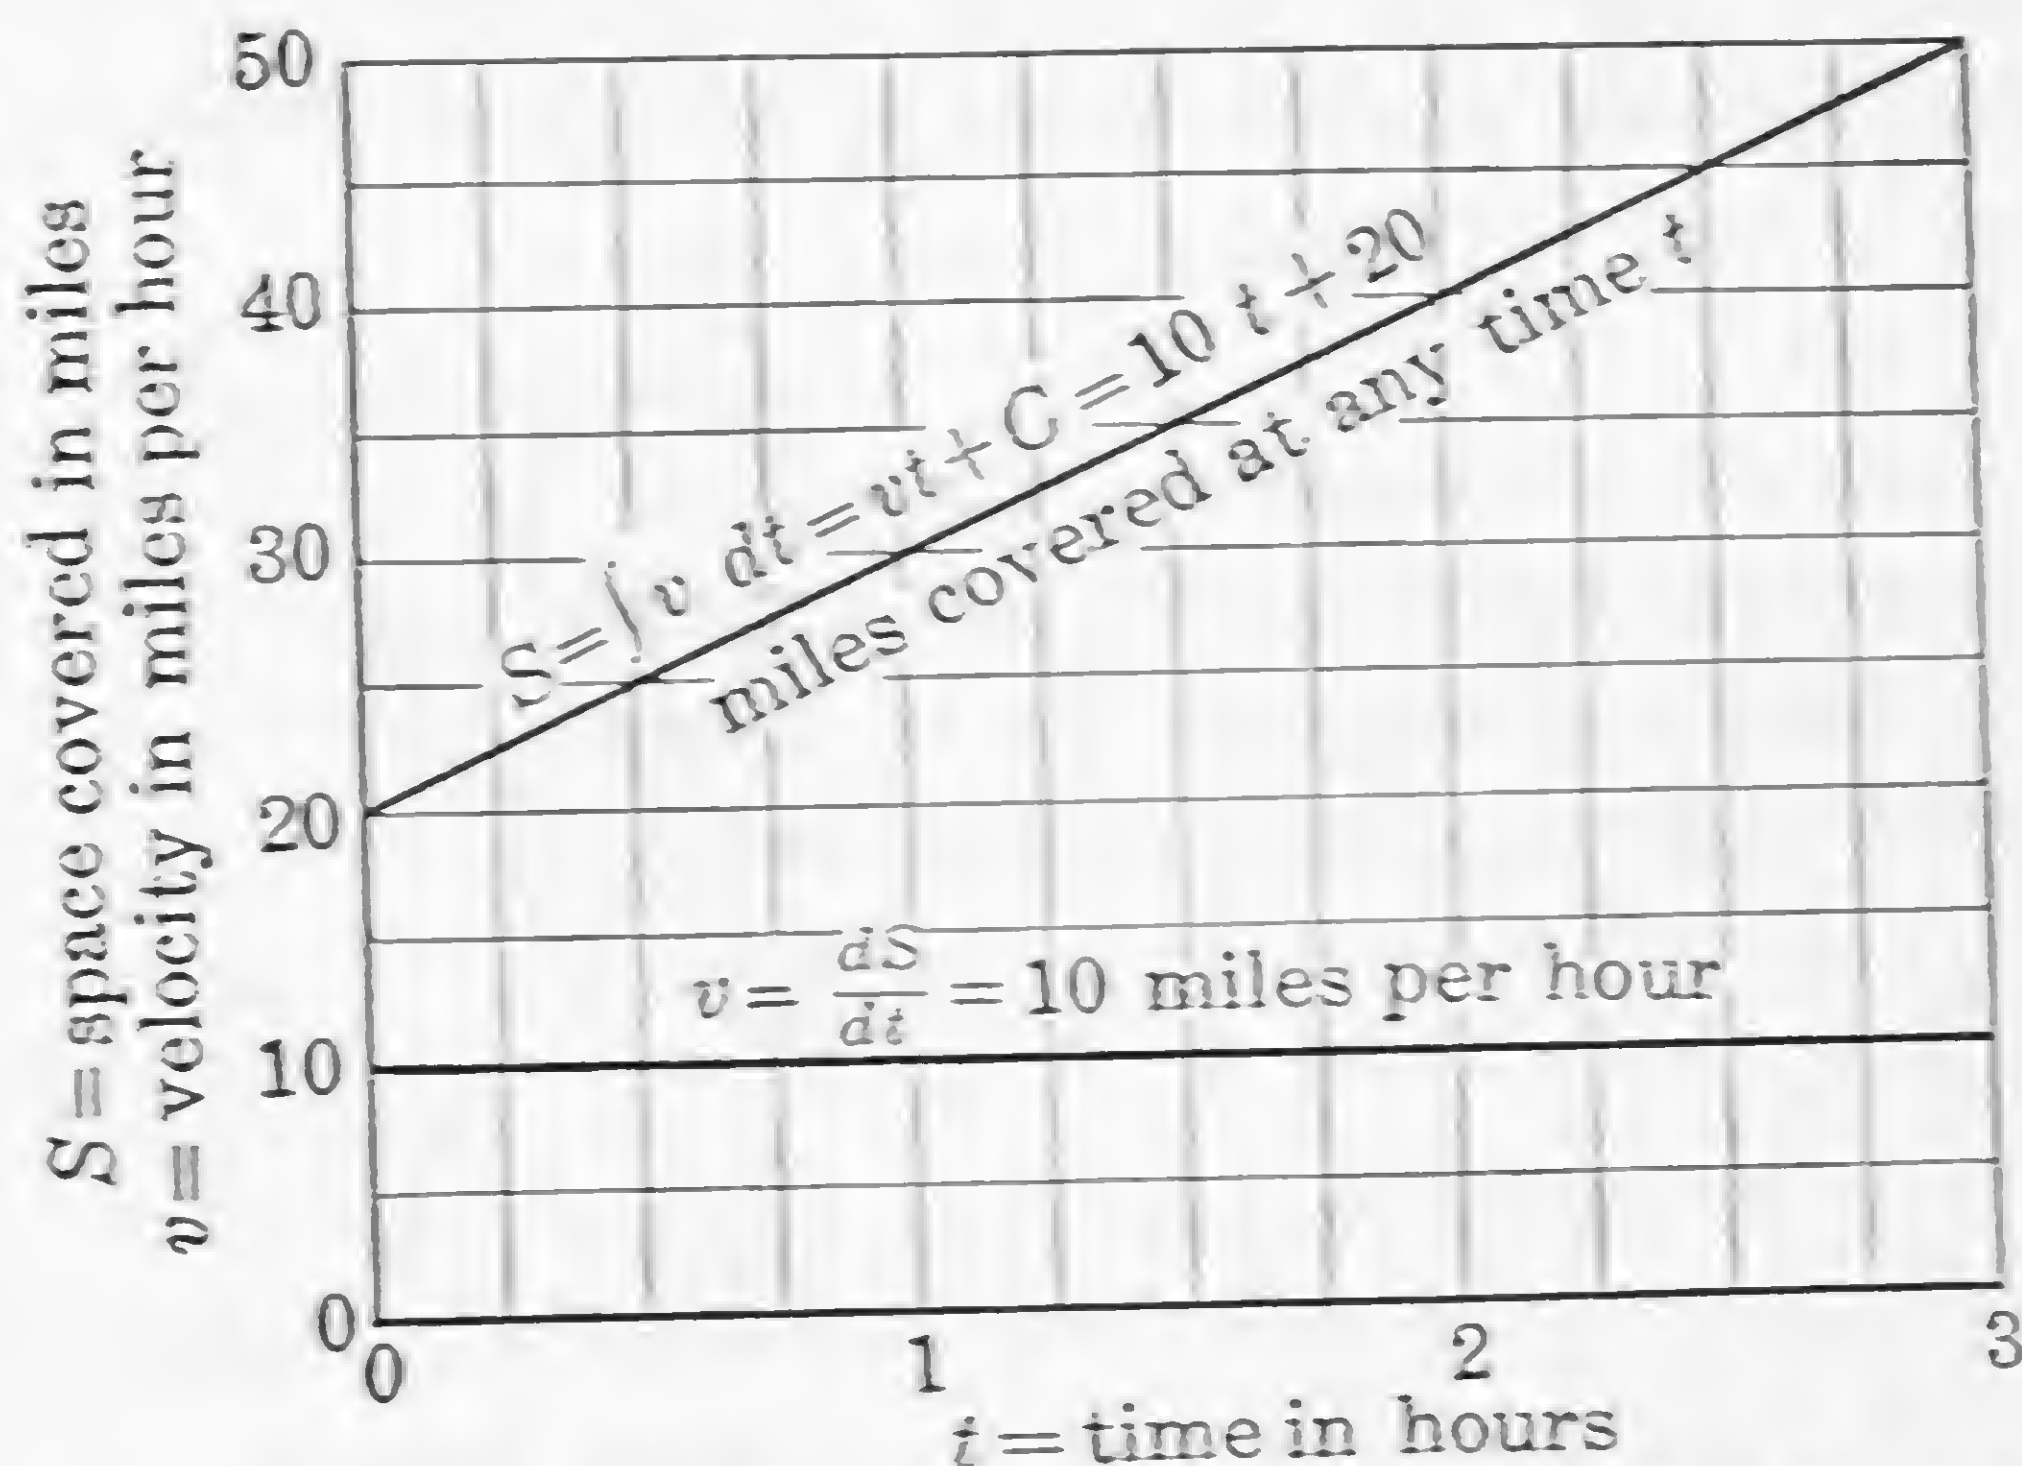

FIG. 88.—A graph which illustrates both integral and differential equations.

A study of Example 8 and the curves in Fig. 88 should help to clarify what is happening. The slope of the curve  $S = vt + C$  is

$$\frac{dS}{dt} = v$$

a constant velocity represented by the horizontal line. Changing this equation from an expression of a slope to differential form and then integrating give the area under this curve for any time  $t$ . At time  $t = 1$  hr, for illustration, the area is  $10 \cdot 1 = 10$  miles traveled in this hour. This is represented by the  $S$  curve going from 20 miles at time  $t = 0$  to 30 miles at time  $t = 1$  hr.

This *S* curve starts at 20 because the mileage indicator originally had that reading.

$$(IV) \quad \int x \, dx = \frac{1}{2} x^2 + C \quad (15)$$

Integral equations can be solved only if some function is known which yields the desired differential equation. The process is then to determine the differential equations for all known functions. Reversing the process and adding a constant will then give the desired integral equation. This we have done, giving the answer first, and then checking it by differentiation. Thus, let

$$y = \frac{1}{2} x^2 + C$$

$$dy = 2 \left( \frac{1}{2} \right) x \, dx = x \, dx \quad \text{Check.}$$

$$\text{Hence,} \quad y = \int dy = \int x \, dx = \frac{1}{2} x^2 + C$$

*Example 9.* Solve  $\int ax \, dx$ .

*Solution.* Moving the constant  $a$  outside the integral sign and using Eq. (15),

$$\int ax \, dx = a \int x \, dx = \frac{1}{2} ax^2 + C \quad \text{Ans.}$$

$$(V) \quad \int x^n \, dx = \frac{1}{n+1} x^{n+1} + C \quad (16)$$

$$\text{Let,} \quad y = \frac{1}{n+1} x^{n+1} + C$$

$$\text{Then,} \quad dy = x^n \, dx$$

This checks the integral.

$$\text{Hence,} \quad y = \int dy = \int x^n \, dx = \frac{1}{n+1} x^{n+1} + C$$

*Example 10.* Solve  $\int x^2 \, dx$ .

*Solution.* By Eq. (16)  $\int x^2 \, dx = \frac{1}{3} x^3 + C$ . Ans.

$$\int x^{-1} \, dx = \int \frac{dx}{x} = \ln x + C \quad (17)$$

This is an exceptional case to Rule V, because here we deal with infinite values for which Rule V does not apply. A search of derivatives will give a function,  $y = \ln x + C$  the differential of which is

$$dy = \frac{1}{x} dx$$

so the problem is solved, and

$$y = \int dy = \int x^{-1} dx = \ln x + C$$

This solution is a striking example of a problem that cannot be solved until the corresponding differentiation is found. This can be further illustrated by the differential equation

$$dy = a^{-x^2} dx$$

which even today has not been integrated because no one has found  $a^{-x^2}$  when differentiating some other function.

$$(VII) \quad \int (u + v) dx = \int u dx + \int v dx \quad (18)$$

This merely states that the integral of an algebraic sum  $(u + v)$  is the same as the sum of the integrals of  $u$  and  $v$ . This is a useful equation to reduce equations to standard forms which can be recognized and integrated.

*Example 11.* Find the integral of  $\int (x + 1)(x + 2) dx$ .

*Solution.* Multiplying,  $(x + 1)(x + 2) = x^2 + 3x + 2$   
Then, by Eq. (18),

$$\begin{aligned} \int (x^2 + 3x + 2) dx &= \int x^2 dx + \int 3x dx + \int 2 dx \\ &= \frac{1}{3} x^3 + \frac{3}{2} x^2 + 2x + C \quad \text{Ans.} \end{aligned}$$

$$(VIII) \quad \int u dx = ux - \int x du + C \quad (19)$$

This is one of the most useful algebraic integrals and is known as "integration by parts." It says that if  $x du$  can be found then  $u dx$  can also be found. The equation can be derived as follows:

The differential of a product is

$$d(uv) = u dv + v du$$

Rearranging this equation,

$$u dv = d(uv) - v du$$

and integrating both sides of the equation results in

$$\int u dv = uv - \int v du + C \quad (20)$$

This is the same as Eq. (19) but with  $v$  instead of  $x$  as the variable.

**Example 12.** Find  $\int x e^x dx$ .

**Solution.** Let 
$$\begin{array}{ll} u = x & dv = e^x dx \\ du = dx & v = e^x \end{array}$$

Making these substitutions in Eq. (20) gives

$$\int x e^x dx = x e^x - \int e^x dx + C = x e^x - e^x + C = e^x(x - 1) + C \quad \text{Ans.}$$

$$(IX) \quad \int e^{ax} dx = \frac{1}{a} e^{ax} + C \quad (21)$$

Differentiating,

$$\frac{d}{dx} \left( \frac{1}{a} e^{ax} \right) = e^{ax}$$

Hence the above equation must be correct.

**Example 13.** The current in a circuit is given by the equation

$$i = \frac{E}{R} \left( 1 - e^{-\frac{R}{L}t} \right)$$

What charge of electricity  $Q = \int i dt$  has passed through the circuit in  $t$  seconds?

**Solution.** Substituting for  $i$ ,

$$Q = \int \frac{E}{R} \left( 1 - e^{-\frac{R}{L}t} \right) dt$$

Applying Eq. (18),

$$\begin{aligned} Q &= \int \frac{E}{R} dt - \int \frac{E}{R} e^{-\frac{R}{L}t} dt \\ &= \frac{Et}{R} - \frac{E}{R} \left( -\frac{L}{R} \right) e^{-\frac{R}{L}t} + C \\ &= \frac{Et}{R} + \frac{EL}{R^2} e^{-\frac{R}{L}t} + C \quad \text{Ans.} \end{aligned}$$

To make this a useful engineering answer, other information is needed to evaluate  $C$ .

$$(X) \quad \int \ln x dx = x(\ln x - 1) + C \quad (22)$$

To prove this, take the derivative

$$\frac{d}{dx} (x \ln x - 1) = x \cdot x^{-1} + \ln x - 1 = \ln x \quad \text{Check.}$$

$$(XI) \quad \int \sin ax dx = -\frac{1}{a} \cos ax + C \quad (23)$$

Taking the derivative of the answer,

$$\frac{d}{dx} \left( -\frac{1}{a} \cos ax \right) = -\frac{1}{a} (-a) \sin ax = \sin ax \quad \text{Check.}$$

Making  $a = 1$  gives the answer for  $\int \sin x = -\cos x + C$

$$(XII) \quad \int \cos ax \, dx = \frac{1}{a} \sin ax + C \quad (24)$$

Similarly,  $\frac{d}{dx} \left( \frac{1}{a} \sin ax \right) = \cos ax \quad \text{Check.}$

$$(XIII) \quad \int \tan ax \, dx = -\frac{1}{a} \ln (\cos ax) + C \quad (25)$$

To prove this, write

$$\int \tan ax \, dx = \int \frac{\sin ax}{\cos ax} \, dx = \frac{1}{a} \int \frac{d(\cos ax)}{\cos ax}$$

Now, by applying Eq. (17),

$$\frac{1}{a} \int \frac{d(\cos ax)}{\cos ax} = \frac{1}{a} \ln (\cos ax) + C \quad \text{Check.}$$

**Multiple Integrals.**—We have already discussed *partial differentiation* when there were several variables. The inverse process is called *partial integration*. When making a partial integration all variables but one are held constant for the first integration and then in the second integration only one other variable is allowed to vary. This is continued until all the variables are allowed to vary during the integration. When performing multiple integration there are as many integral signs as there are variables to be integrated.

Consider the multiple integral

$$z = \iint (x^2 + y^2) \, dx \, dy \quad (26)$$

Holding  $y^2$  and  $dy$  constant while integrating with respect to  $x$ ,

$$\begin{aligned} z &= \int [\int (x^2 + y^2) \, dx] \, dy = \int [\int x^2 \, dx + \int y^2 \, dx] \, dy \\ &= \int \left[ \frac{1}{3} x^3 + y^2 x \right] \, dy \end{aligned}$$

Now, holding  $x^3$  and  $x$  constant while integrating with respect to  $y$ ,

$$z = \frac{1}{3} x^3 y + \frac{1}{3} y^3 x + C$$

Double integrals are useful in determining areas. The general equation for an area is given by the equation

$$A = \iint dy \, dx \quad (28)$$

where the inner integral  $\int dy$  gives the total length of the  $y$  line by summing up all the little  $dy$  bits. Then this line is moved in the  $x$  direction by a small amount  $dx$  and summed over the total  $x$  distance involved.

Another way to visualize this is to consider an elemental area  $dy \cdot dx$  as shown in Fig. 89. This elemental area is summed from the  $x$ -axis to the curve along the  $dx$  strip. Then the strips are summed in the  $x$  direction from the  $y$ -axis to the end of the area, which is  $x = 3$  in this case.

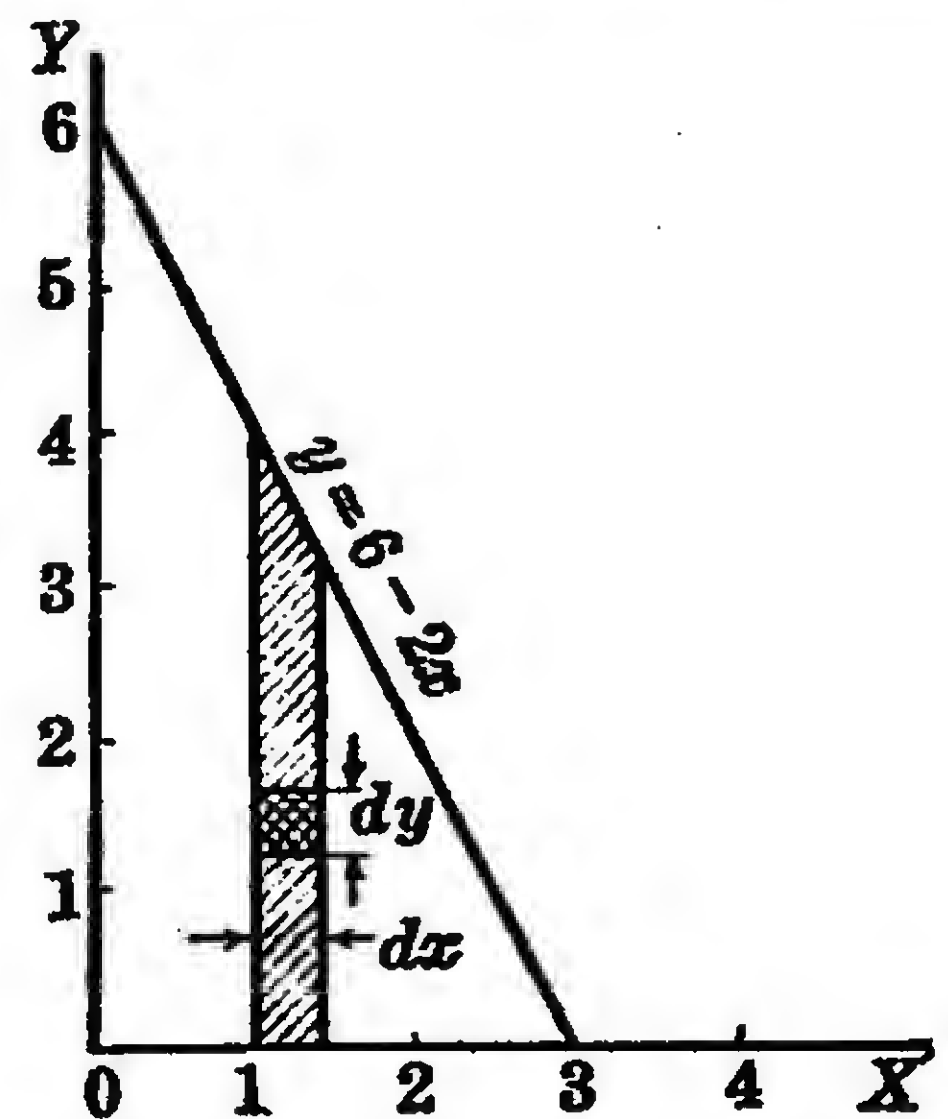

FIG. 89.—Double integration of an area.

**Example 14.** By double integration, find the shaded area between the line  $y = 6 - 2x$ , the  $x$  and  $y$  axes.

**Solution.** By Eq. (28) the area is,

$$\begin{aligned} A &= \int_{x=0}^{x=3} \int_{y=0}^{y=6-2x} dy \, dx \\ &= \int_0^3 y \Big|_0^{6-2x} dx = \int_0^3 (6 - 2x) dx \\ &= \int_0^3 6 \, dx - \int_0^3 2x \, dx = 6x \Big|_0^3 - x^2 \Big|_0^3 \\ &= (6 \cdot 3 - 0) - (3^2 - 0) = 9 \quad \text{Ans.} \end{aligned}$$

This simple example illustrates the process of substituting the limits for a double integral and solving the integral equation for the area.

Triple integrals are useful in determining volumes. The general equation for a volume in Cartesian coordinator is given by

$$V = \iiint dx \, dy \, dz \quad (29)$$

This type of equation is used, for example, to find the electric charge  $\rho$  in space. In such a case the equation is written

$$V = \iiint \rho \, dx \, dy \, dz \quad (30)$$

where  $\rho$  is the charge density in the increment of volume  $dx \, dy \, dz$ .

Some of the more elementary ideas of calculus have been presented, to enable the reader to follow better the reasoning of authors who resort to calculus in their technical articles or books. Calculus can be considered as an art that is acquired only by continued study and by solving many problems. It is used as a practical tool by many research and design engineers. To those desiring to pursue the subject further, a few references are given along with a well known table of integrals. A short table of derivative and integral tables for ready reference will be found on page 308 in the appendix.

#### Exercises

1. Determine the average current  $I_{av}$  of the sine curve  $i = \sin \omega t$  by taking values every  $10^\circ$  up to  $90^\circ$  and using the trapezoidal rule.
2. Determine the average current  $I_{av}$  of the sine curve  $i = \sin \omega t$  by taking values every  $15^\circ$  up to  $90^\circ$  and using Simpson's rule.
3. Integrate the sine curve  $i = \sin \omega t$  from  $\omega t = 0$  to  $\omega t = \frac{\pi}{2}$  radians to determine the average current  $I_{av}$ . Compare the accuracy of the three methods used above to four decimal places.
4. Find the value of the series

$$S_\infty = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \dots$$

to eight terms.

5. Integrate  $\int \frac{dx}{x^5}$  and  $\int ax^3 dx$ .
6. Integrate  $\int 2(x+1) dx$  and  $\int 4(x^2+2)(x-1) dx$ .
7. Integrate  $\int a^2 \frac{dx}{x}$ .
8. Integrate  $\int x^2 e^x dx$ .
9. Integrate  $\int \cos 6\omega t d(\omega t)$  and  $\int 16^{2x} dx$ .
10. Integrate  $\int a \ln(10x) dx$ .

## CHAPTER 15

### SERIES AND WAVE FORMS

The use of series makes possible the numerical solution of many problems that would otherwise be extremely difficult.

This chapter will deal with some of the more useful series and wave forms encountered in engineering work. Particular attention will be given to practical applications of power series and the use of Fourier's series to express wave forms.

**Definitions.**—A *series* is the sum of a sequence of terms. "Sequence" means that the terms are formed according to some fixed rule. Thus, the sequence of terms

$$1, 2, 3, 4, \text{ etc.}$$

can be written into the series

$$S_n = 1 + 2 + 3 + 4 + \cdots + k + \cdots + n = \sum_{k=1}^{k=n} k \quad (1)$$

where  $S_n$  = a series of  $n$  terms.

$k$  = a general or representative term in the series.

$n$  = the last term.

A *finite series* has a limited number of terms. For illustration, the series

$$(a + b)^3 = a^3 + 3a^2b + 3ab^2 + b^3 \quad (2)$$

is a finite series containing only four terms.

An *infinite series* has an unlimited number of terms. The fraction

$$\frac{1}{3} = 0.3 + 0.03 + 0.003 + 0.0003 + \cdots \quad (3)$$

is a good illustration of an infinite series when the fraction is expressed decimally because no matter how many decimal terms you add the sum will never quite reach the value of  $\frac{1}{3}$ . In other words, an infinite number of terms must be added to give the desired answer.

A *convergent series* approaches a finite value as the number of terms are increased. Equations (2) and (3) are convergent

series. Equation (2) reaches the final finite value with only four terms.

A *divergent series* approaches an infinite value as the number of terms is increased. Equation (1) is a divergent series because the sum of terms becomes increasingly large as the number  $n$  is made larger.

*Example 1.* Write down three more terms and the  $k$ th term, and also express as a summation, the series

$$S_n = 2 + 4 + 8 + 16 + \dots$$

*Solution.* It is noted that each succeeding term doubles. The second term is the square of the first term and the third term is the cube of the first term. Hence the desired series is

$$S_n = 2 + 4 + 8 + 16 + 32 + 64 + 128 + \dots + 2^k + \dots + 2^n = \sum_{k=1}^{k=n} 2^k \quad \text{Ans.}$$

**Comparison Test for Convergence or Divergence.**—Since a converging series has a definite value, it is of far more practical importance than a diverging series. It is therefore important to know if the series is convergent or divergent. One of the simplest ways to test this is to compare the given series with a series that is known to converge. Two series are frequently used to apply this test. The geometric (or power) series

$$\begin{aligned} S_n &= a + ax + ax^2 + \dots + ax^{n-1} \\ &= \frac{a(1 - x^n)}{1 - x} = \frac{a(x^n - 1)}{x - 1} \end{aligned} \quad (4)$$

converges when  $x$  is less than 1 and diverges when  $x$  is equal to or greater than 1. If  $x$  is less than 1, then  $x^n$  will become very small as  $n$  is increased, hence  $x^n$  can be neglected, with the result that the series converges to the value

$$S_n = \frac{a}{1 - x} \quad \text{when} \quad x < 1 \quad (5)$$

When  $x$  is greater than 1, the term  $x^n$  in the last fraction of Eq. (4) becomes increasingly large as  $n$  is increased, with the result that no definite value can be given to the fraction. This means that the series is divergent for  $x > 1$ .

When  $x$  equals 1, the series reduces to a sum of  $a$  terms. Hence as  $n$  is increased the sum will continue to increase. Therefore, the series is divergent when  $x = 1$ .

The  $p$  series which is frequently used in the comparison test is

$$S_n = 1 + \frac{1}{2^p} + \frac{1}{3^p} + \cdots + \frac{1}{k^p} + \cdots + \frac{1}{n^p} = \sum_{k=1}^{k=n} \frac{1}{k^p} \quad (6)$$

which is convergent for  $p > 1$  and divergent for  $p \leq 1$ .

The comparison test states that a given series converges if corresponding terms are smaller than those of a converging series. Likewise, a given series diverges if corresponding terms are larger than those of a diverging series.

Applying these rules and Eq. (4), let us see if the following series is convergent:

$$f(x) = 1 + \frac{9}{10} + \left(\frac{9}{10}\right)^2 + \cdots$$

Then  $S_n = 1 + x + x^2 + \cdots$  is the value of Eq. (4) when  $a = 1$ . Equating corresponding terms,  $x = \frac{9}{10}$ ; hence  $x < 1$  and the series converges by the comparison test.

*Example 2.* Test the following series for convergence or divergence.

$$f(k) = \sum_{k=1}^{k=\infty} 2 \left(\frac{1}{k}\right)^k$$

*Solution.* Comparing this series with Eq. (4) when  $a = 2$  and  $x$  is less than 1, we have

$$\text{test series } S_n = 2 + 2x + 2x^2 + 2x^3 + \cdots + 2x^n$$

$$\text{and given series } f(k) = 2 + 2 \left(\frac{1}{2}\right)^2 + 2 \left(\frac{1}{3}\right)^3 + 2 \left(\frac{1}{4}\right)^4 + \cdots + 2 \left(\frac{1}{n}\right)^n$$

Comparing term by term, the first terms are equal, the second term of the given series is less than the second term of the test series when  $x$  is slightly less than 1, and so on for the rest of the terms. hence the series converges.  
*Ans.*

*Note:* The given series could be shifted to the right one place so the exponents would be similar; then the terms of the given series would all be less than corresponding terms of the test series with the exception of the first term of the given series. Since the first term is finite, the series must converge, because the rest of the series converges.

*Example 3.* Test for convergence or divergence the following series:

$$Q_n = \sum_{n=1}^{\infty} \frac{1}{5n}$$

*Solution.* Comparing this with Eq. (6) when  $p = 1$  gives

$$\text{test series } S_n = 1 + \frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{n}$$

$$\begin{aligned} \text{and given series } Q_n &= \frac{1}{5} + \frac{1}{5 \cdot 2} + \frac{1}{5 \cdot 3} + \cdots + \frac{1}{5 \cdot n} \\ &= \frac{1}{5} \left( 1 + \frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{n} \right) \end{aligned}$$

Since the test series diverges for  $p = 1$ , the given series must also diverge, because, when the factor  $\frac{1}{5}$  is removed, the corresponding terms are identical. *Ans.*

**Ratio Test for Convergence or Divergence.**—If the test ratio of the  $(n + 1)$ th term divided by the  $n$ th term is less than 1, a series of positive terms is convergent. If this ratio is greater than 1, the series is divergent. If the ratio equals 1, the test fails.

In equation language, the *test ratio* for a series of positive terms is

$$\rho = \frac{x_{n+1}}{x_n} \quad (7)$$

when  $\rho < 1$  the series is convergent.

$\rho > 1$  the series is divergent.

$\rho = 1$  the test ratio fails.

*Example 4.* Test the following series for convergence or divergence:

$$S_n = \frac{1}{10} + \frac{2}{10^2} + \frac{3}{10^3} + \cdots + \frac{n}{10^n} + \frac{n+1}{10^{n+1}}$$

*Solution.* By Eq. (7),

$$\rho = \frac{x_{n+1}}{x_n} = \frac{\frac{n+1}{10^{n+1}}}{\frac{n}{10^n}} = \frac{n+1}{10} > 1$$

Hence, the series is divergent. *Ans.*

A good general rule is first to apply the test ratio and then, if  $\rho = 1$ , to resort to the *comparison test*.

**Power Series.**—The power series

$$S_n = a_0 + a_1x + a_2x^2 + a_3x^3 + \dots + a_nx^n \quad (8)$$

Where the  $a$  terms are independent of the  $x$  terms, the series may converge or diverge depending upon the values of the  $a$  and  $x$  terms. The above tests should be applied to determine these properties.

The sum of two converging power series is another converging power series. For illustration, add

$$\begin{array}{r} e^x = 1 + x + \frac{x^2}{2} + \frac{x^3}{3} + \frac{x^4}{4} + \dots \\ e^{-x} = 1 - x + \frac{x^2}{2} - \frac{x^3}{3} + \frac{x^4}{4} - \dots \\ \hline e^x + e^{-x} = 2 + \frac{2x^2}{2} + \frac{2x^4}{4} + \dots = 2 \cosh x \end{array}$$

The product of two converging power series is another converging power series. For example, multiply

$$\sin x = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \dots$$

by

$$\cos x = 1 - \frac{x^2}{2} + \frac{x^4}{4} - \frac{x^6}{6} + \dots$$

Then

$$\begin{aligned} \sin x \cos x &= x - \left(\frac{1}{2} + \frac{1}{3}\right)x^3 + \left(\frac{1}{4} + \frac{1}{2 \cdot 3} + \frac{1}{5}\right)x^5 - \dots \\ 2 \sin x \cos x &= 2x - \frac{8}{6}x^3 + \frac{32}{120}x^5 - \dots \\ &= 2x - \frac{(2x)^3}{6} + \frac{(2x)^5}{120} - \dots = \sin 2x \end{aligned}$$

If a converging power series is divided by another converging power series, the quotient must be tested for convergence, since it may be divergent. To illustrate, divide the series  $\cos x$  by  $x$ , thus

$$\cos x = 1 - \frac{x^2}{2} + \frac{x^4}{4} - \dots$$

and

$$\frac{\cos x}{x} = \frac{1}{x} - \frac{x}{2} + \frac{x^3}{4} - \dots$$

This is not a power series, because the  $\frac{1}{x}$  term is present, but the rest of the series after this term is a power series.

Power series are very useful in engineering to express binomials such as

$$\begin{aligned}(a + x)^n &= a^n + na^{n-1}x + \frac{n(n-1)}{2} a^{n-2}x^2 + \dots \quad (9) \\ &= a_0 + a_1x + a_2x^2 + \dots\end{aligned}$$

In this equation the  $a$  terms are defined thus:  $a_0 = a^n$ ,  $a_1 = na^{n-1}$ , etc.

*Example 5.* In an artificial transmission line, express the characteristic impedance

$$Z_0 = \sqrt{\frac{Z_1}{Z_2} + \left(\frac{Z_1}{2Z_2}\right)^2}$$

by a power series to two terms.

*Solution.* Let  $\frac{Z_1}{Z_2} = a$  and  $\left(\frac{Z_1}{2Z_2}\right)^2 = x$ , then  $n = \frac{1}{2}$  and the above binomial expansion gives

$$Z_0 = \left(\frac{Z_1}{Z_2}\right)^{1/2} + \frac{1}{2} \left(\frac{Z_1}{Z_2}\right)^{-1/2} \left(\frac{Z_1}{2Z_2}\right)^2 + \dots \quad \text{Ans.}$$

**Maclaurin's Series.**—Many functions can be expressed as a power series if the  $a$  terms can be evaluated. We have already treated the binomial series method which works in some cases. We will now treat Maclaurin's series, which works in other cases.

Consider the power series

$$f(x) = a_0 + a_1x + a_2x^2 + a_3x^3 + \dots \quad (10)$$

The first term  $a_0$  can be determined by letting  $x = 0$ , thus

$$f(0) = a_0 \quad (11)$$

Now, if the first derivative is taken and then  $x$  is set equal to zero, we have

$$\frac{d}{dx} [f(x)] = f'(x) = 0 + a_1 + 2a_2x + 3a_3x^2 + \dots$$

Setting  $x = 0$  results in  $f'(0) = a_1$  (12)

Taking the second derivative and then setting  $x = 0$  gives

$$f''(0) = 2a_2 = \underline{2} a_2 \quad (13)$$

Similarly,

$$f'''(0) = 6a_3 = \underline{3} a_3 \quad (14)$$

In general,

$$f^{(n)}(0) = \underline{n} a_n \quad (15)$$

Making these substitutions for the  $a$  terms in Eq (10) results in Maclaurin's series

$$f(x) = f(0) + f'(0) \frac{x}{\underline{1}} + f''(0) \frac{x^2}{\underline{2}} + f'''(0) \frac{x^3}{\underline{3}} + \dots \quad (16)$$

*Example 6.* Use Maclaurin's series to express the function

$$f(x) = \frac{1}{1-x} = (1-x)^{-1}.$$

*Solution.*

By Eq. (11),	$f(x) = (1-x)^{-1}$	$f(0) = 1$
By Eq. (12),	$f'(x) = (1-x)^{-2}$	$f'(0) = 1 = \underline{1}$
By Eq. (13),	$f''(x) = 2(1-x)^{-3}$	$f''(0) = 2 = \underline{2}$
By Eq. (14),	$f'''(x) = 6(1-x)^{-4}$	$f'''(0) = 6 = \underline{3}$
By Eq. (15),	$f^{(n)}(x) = \underline{n}(1-x)^{-n-1}$	$f^{(n)}(0) = \underline{n}$

Substituting these values in Eq. (16),

$$f(x) = 1 + x + x^2 + x^3 + \dots + x^n \quad \text{Ans.}$$

This example can be checked by performing the division  $\frac{1}{1-x}$  or by using the binomial expansion of  $(1-x)^{-1}$ .

**Approximate Formulas by Using Maclaurin's Series.**—One of the most common uses of the power series is to evaluate functions. The accuracy of the evaluation depends upon the number of terms taken in the converging series. Such approximate formulas are widely used in engineering. A few cases will be given.

1. When  $x$  is small and  $n$  is positive,

	First approximation	Second approximation
$(1 \pm x)^n =$	$1 \pm nx$	$= 1 \pm nx \pm \frac{n(n-1)}{2} x^2$

(17)

2. When  $x$  is small and  $n$  is positive,

	First approximation	Second approximation
$\frac{1}{(1 \pm x)^n} =$	$1 \mp nx$	$= 1 \mp nx \mp \frac{n(n-1)}{2} x^2$

(18)

3. When  $x$  is small,

$$\begin{array}{ccc} \text{First approximation} & & \text{Second approximation} \\ \sin x = & x & = x - \frac{x^3}{6} \end{array} \quad (19)$$

*Example 7.* State the error by using the second approximation of  $\sin x$  when  $x = 45^\circ = \frac{\pi}{4}$ .

$$\begin{aligned} \text{Solution. } \sin x &= \frac{\pi}{4} - \frac{\pi^3}{6 \cdot 4^3} = 0.785368 - 0.0807746 \\ &= 0.704622 \end{aligned}$$

From the tables,  $\sin x = 0.707107$

The error is less than 0.002485. *Ans.*

In this example,  $x$  was not small enough to give good accuracy.

**Taylor's Series.**—Sometimes it is desired to evaluate a function near some value other than zero. Taylor's series is a generalization of Maclaurin's series which permits the evaluation of a function near some fixed value such as  $a$ . If the power series is written in the form

$$f(x) = b_0 + b_1(x - a) + b_2(x - a)^2 + \dots \quad (20)$$

Then  $x$  can be evaluated for  $(x - a)$ , as was done in the case of Maclaurin's series, to get

$$b_0 = f(a), \quad b_1 = f'(a), \quad b_n = \frac{f^{(n)}(a)}{n!}$$

Making these substitutions results in Taylor's series

$$\begin{aligned} f(x) &= f(a) + f'(a)(x - a) + \frac{f''(a)(x - a)^2}{2!} + \dots \\ &\quad + \frac{f^{(n)}(a)(x - a)^n}{n!} \end{aligned} \quad (21)$$

*Example 8.* Evaluate  $\cos x$  when  $\alpha = \frac{\pi}{4} = 45^\circ$  by Taylor's series.

$$\begin{array}{ll} f(x) = \cos x & f(a) = \cos \alpha = \frac{1}{\sqrt{2}} \\ f'(x) = -\sin x & f'(a) = -\sin \alpha = -\frac{1}{\sqrt{2}} \\ f''(x) = -\cos x & f''(a) = -\cos \alpha = -\frac{1}{\sqrt{2}} \\ f'''(x) = \sin x & f'''(a) = \sin \alpha = \frac{1}{\sqrt{2}} \end{array}$$

Then, by Taylor's series,

$$\begin{aligned}
 (x) = \cos x &= \cos \alpha - \sin \alpha \frac{(x - \alpha)}{1} - \cos \alpha \frac{(x - \alpha)^2}{2} \\
 &\quad + \sin \alpha \frac{(x - \alpha)^3}{3} + \dots \\
 &= \frac{1}{\sqrt{2}} - \frac{1}{\sqrt{2}} \left(x - \frac{\pi}{4}\right) - \frac{1}{\sqrt{2}} \frac{\left(x - \frac{\pi}{4}\right)^2}{2} + \frac{1}{\sqrt{2}} \frac{\left(x - \frac{\pi}{4}\right)^3}{3} + \dots \\
 &= 0.70711 \left[ 1 - \left(x - \frac{\pi}{4}\right) - \frac{1}{2} \left(x - \frac{\pi}{4}\right)^2 + \frac{1}{6} \left(x - \frac{\pi}{4}\right)^3 + \dots \right] \text{ Ans.}
 \end{aligned}$$

In this answer the angles must be expressed in radians.

**Approximate Formulas by Using Taylor's Series.**—Taylor's series is particularly useful in evaluating functions for making tables with high accuracy. Much greater accuracy can be secured with a given number of terms than is usually obtained from using Maclaurin's series. To illustrate, a few cases will be given.

1. When  $x$  is nearly equal to  $\alpha$ ,

First approximation

$$\sin x \doteq \sin \alpha + (x - \alpha) \cos \alpha$$

Second approximation

$$\doteq \sin \alpha + (x - \alpha) \cos \alpha - \frac{(x - \alpha)^2}{2} \sin \alpha \quad (22)$$

2. When  $x$  is nearly equal to  $\alpha$ ,

First approximation

$$\cos x \doteq \cos \alpha - (x - \alpha) \sin \alpha$$

Second approximation

$$\doteq \cos \alpha - (x - \alpha) \sin \alpha - \frac{(x - \alpha)^2}{2} \cos \alpha \quad (23)$$

3. When  $x$  is nearly equal to  $\alpha$ ,

First approximation

$$e^x \doteq e^\alpha + (x - \alpha)e^\alpha$$

Second approximation

$$\doteq e^\alpha + (x - \alpha)e^\alpha + \frac{(x - \alpha)^2}{2} e^\alpha \quad (24)$$

**Example 9.** Calculate  $\cos 50^\circ$  to the second approximation when  $a = 45^\circ$  and indicate the error.

**Solution.** Substituting  $50^\circ$  in Eq. (23),

$$\begin{aligned}\cos x &= \frac{1}{\sqrt{2}} - \left(\frac{5\pi}{18} - \frac{\pi}{4}\right) \frac{1}{\sqrt{2}} - \frac{\left(\frac{5\pi}{18} - \frac{\pi}{4}\right)^2}{2} \frac{1}{\sqrt{2}} \\ &= 0.70711 \left(1 - \frac{\pi}{36} - \frac{\pi^2}{2 \cdot 36^2}\right) = 0.70711(1 - 0.08727 - 0.00381) \\ &= 0.70711(0.90892) = 0.64271 \quad \text{Ans.}\end{aligned}$$

The tables give  $\cos 50^\circ = 0.64279$

or an error of  $0.00008 \quad \text{Ans.}$

This example shows an accuracy to four places using a second approximation, as compared to Example 7 which gave an accuracy to only two places. This shows that Taylor's series can be chosen to converge rapidly so only a few terms need be used to give a required accuracy.

**Sine and Cosine Integral Functions.**—Since some radiation problems are simplified by the use of these functions, a brief treatment is in order.

The sine integral function is defined

$$Si(x) = \int_0^x \frac{\sin \alpha}{\alpha} d\alpha = x - \frac{x^3}{3 \cdot 3} + \frac{x^5}{5 \cdot 5} - \dots \quad (25)$$

The cosine integral function is defined

$$\begin{aligned}Ci(x) &= \int_{\infty}^x \frac{\cos \alpha}{\alpha} d\alpha = \gamma + \ln x + \int_0^x \frac{\cos \alpha - 1}{\alpha} d\alpha \\ &= \gamma + \ln x - \frac{x^2}{2 \cdot 2} + \frac{x^4}{4 \cdot 4} - \dots\end{aligned} \quad (26)$$

where,

$$\begin{aligned}\gamma &= \int_0^1 \frac{1 - e^{-\alpha}}{\alpha} d\alpha - \int_1^{\infty} \frac{e^{-\alpha}}{\alpha} d\alpha \\ &= 0.796599599 - 0.219383934 \\ &= 0.577215665 \quad \text{Euler's constant} \quad (27)\end{aligned}$$

Euler's constant can also be defined by the series

$$\gamma = \lim_{n \rightarrow \infty} \left[ 1 + \frac{1}{2} + \frac{1}{3} + \dots + \frac{1}{n} - \log n \right]$$

**Example 10.** Show that the integral function in Eq. (25) can be written in a series.

**Solution.** The series for  $\frac{\sin \alpha}{\alpha}$  is the  $\sin \alpha$  series divided by  $\alpha$ , thus

$$\sin \alpha = \alpha - \frac{\alpha^3}{3} + \frac{\alpha^5}{5} - \frac{\alpha^7}{7} + \dots$$

and

$$\frac{\sin \alpha}{\alpha} = 1 - \frac{\alpha^2}{3} + \frac{\alpha^4}{5} - \frac{\alpha^6}{7} + \dots$$

Integrating term by term and substituting the limits results in

$$\begin{aligned} Si(x) &= \int_0^x (1) d\alpha - \int_0^x \frac{\alpha^2}{3} d\alpha + \int_0^x \frac{\alpha^4}{5} d\alpha - \int_0^x \frac{\alpha^6}{7} d\alpha + \dots \\ &= x - \frac{x^3}{3 \cdot 3} + \frac{x^5}{5 \cdot 5} - \frac{x^7}{7 \cdot 7} + \dots \quad \text{Ans.} \end{aligned}$$

**Bessel Functions.**—These functions often appear in engineering literature to solve practical problems dealing with such things as frequency modulation, acoustics, loading transmission lines, and eddy current loss in the core of a solenoid.

The Bessel functions are solutions to the differential equation

$$x^2 \frac{d^2 y}{dx^2} + x \frac{dy}{dx} + (x^2 - n^2)y = 0 \quad (28)$$

The solution of this differential equation is accomplished by evaluating the  $\alpha$  terms of a power series,<sup>1</sup> which results in the following series when  $n = 0$

$$J_0(x) = 1 - \frac{x^2}{2^2} + \frac{x^4}{2^2 \cdot 4^2} - \frac{x^6}{2^2 \cdot 4^2 \cdot 6^2} + \dots \quad (29)$$

which is the Bessel function of the first kind of zero order. When  $n$  is a positive real number or zero in Eq. (28), we have the more general form

$$\begin{aligned} J_n(x) &= \frac{x^n}{2^n n!} \left[ 1 - \frac{x^2}{2(2n+2)} + \frac{x^4}{2 \cdot 4(2n+2)(2n+4)} \right. \\ &\quad \left. - \frac{6}{2 \cdot 4 \cdot 6(2n+2)(2n+4)(2n+6)} + \dots \right] \\ &= \sum_{k=0}^{\infty} \frac{(-1)^k}{k! n!} \left( \frac{x}{2} \right)^{n+2k} \quad (30) \end{aligned}$$

<sup>1</sup> The solution of this differential equation is beyond the scope of this book. Those interested in the subject might consult Reddick and Miller, "Advanced Mathematics for Engineers," John Wiley and Sons.

which is the Bessel function of order  $n$  where  $n$  is a positive integer.

**Example 11.** Show that  $\frac{d}{dx} J_0(x) = -J_1(x)$ .

**Solution.** Performing the indicated differentiation on successive terms of the series in Eq. (29) gives

$$\frac{d}{dx} J_0(x) = 0 - \frac{2x}{2^2} + \frac{4x^3}{2^2 \cdot 4^2} - \frac{6x^5}{2^2 \cdot 4^2 \cdot 6^2} + \dots$$

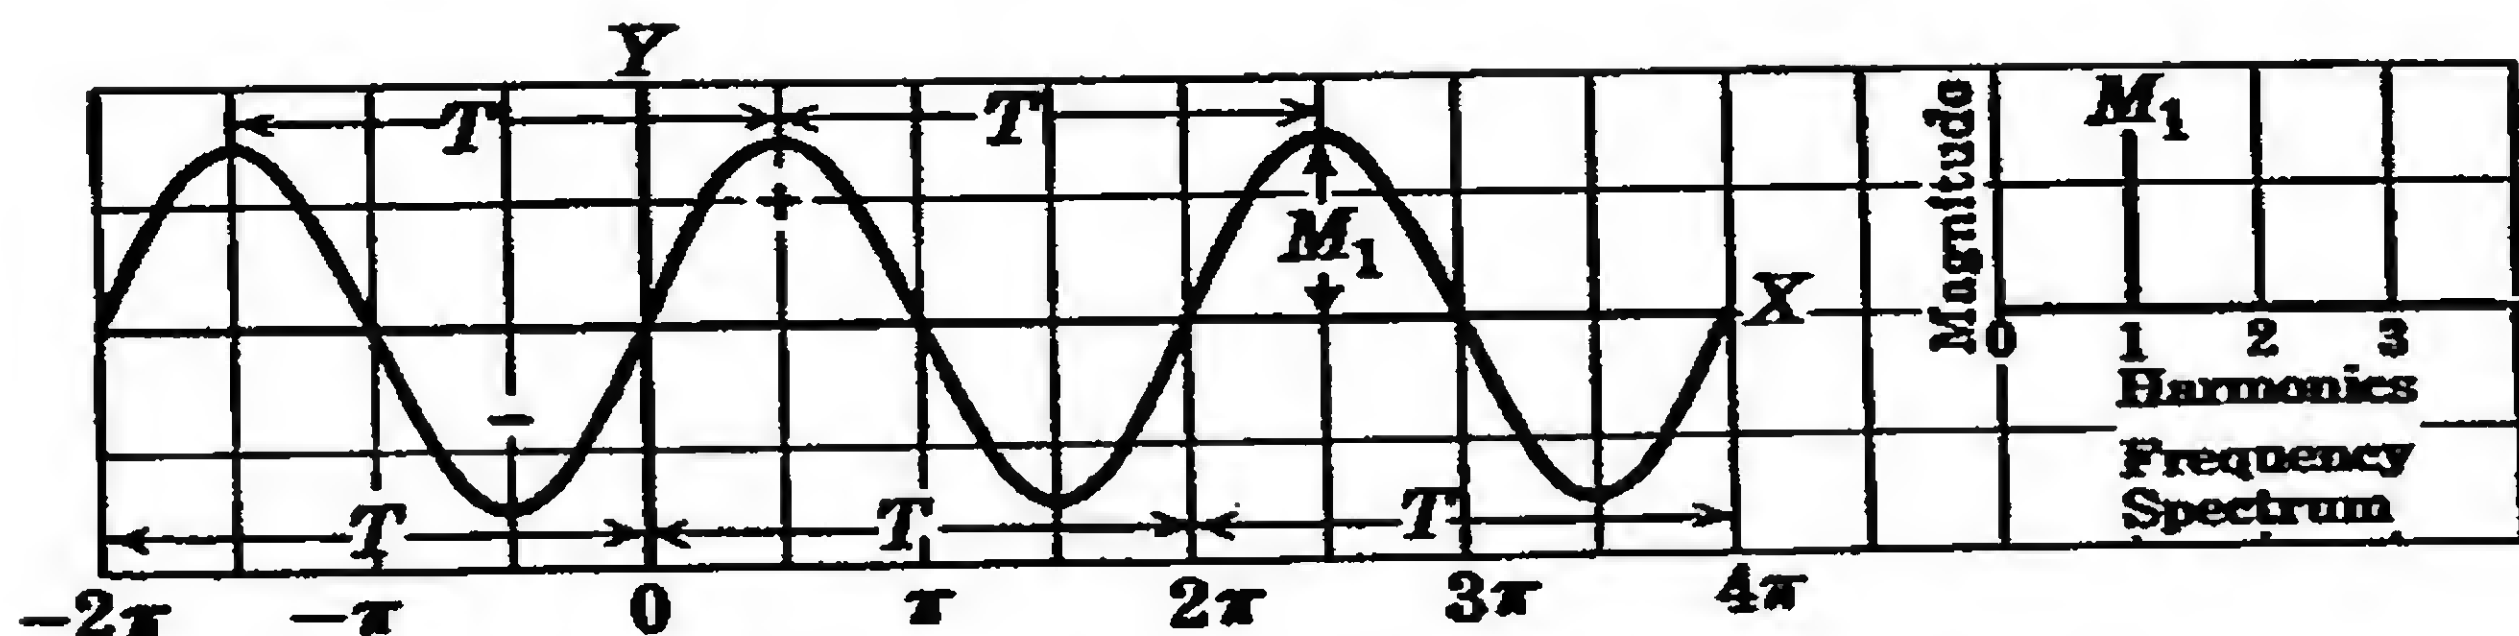

Now substituting  $n = 1$  in Eq. (30) gives

$$J_1(x) = \frac{x}{2} - \frac{x^3}{2^3 \cdot 3} + \frac{x^5}{2^5 \cdot 3 \cdot 5} - \dots$$

A close inspection of each term of these two series reveals that the second series is the negative of the first, hence

$$\frac{d}{dx} J_0(x) = -J_1(x) \quad \text{Ans.}$$

**Periodic Functions.**—A *periodic function* can be represented by a curve that repeats the same shape for each period. Referring to Fig. 90, the sine wave is a simple periodic function that

$$y = M_1 \sin x = M_1 \left[ x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \dots \right]$$

$$= M_1 \sum_{n=0}^{\infty} (-1)^n \frac{x^{(2n+1)}}{(2n+1)} \quad (31)$$

Odd or sine function curve.

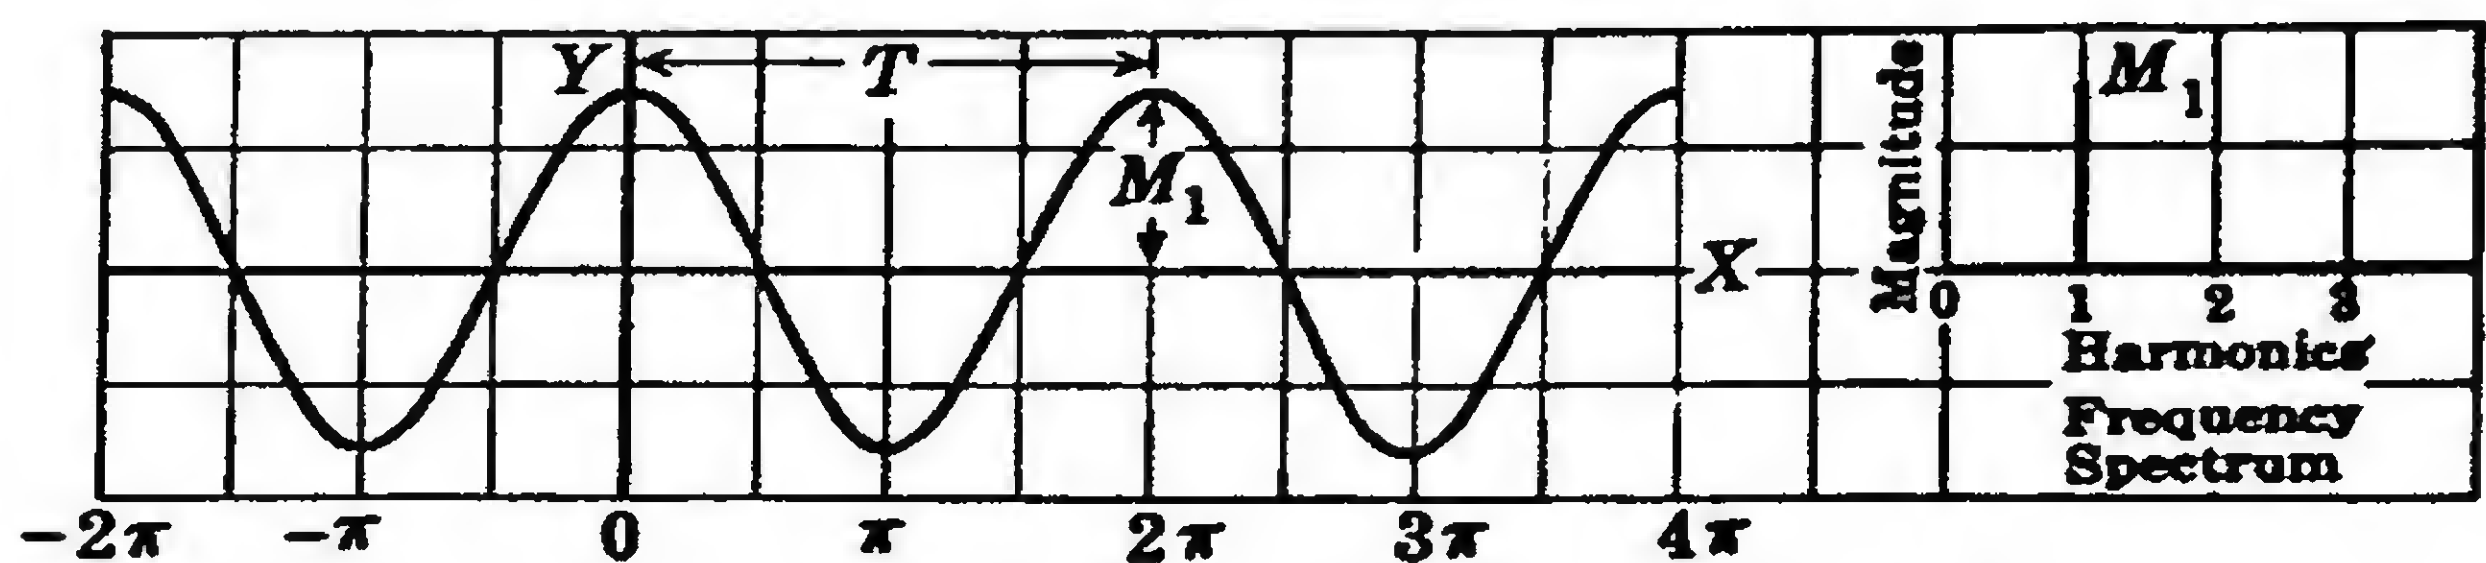

FIG. 90.—Sine wave.

repeats its shape each period  $T$ . The wave starts at  $x = 0$ , following a definite shape until  $x = 2\pi$  is reached. From  $x = 2\pi$  to  $x = 4\pi$  exactly the same curve is repeated. In other words, each time the curve is ready to repeat itself it has completed a period of  $T = 2\pi$ . It should be noted that the series as given in Eq. (31) is made up of odd numbered powers of  $x$

## SERIES AND WAVE FORMS

which results in a curve that is positive just to the right of the  $y$ -axis and negative just to the left of the  $y$ -axis, hence an anti-symmetrical function. An antisymmetrical function is a function that is symmetrical about the origin. To illustrate, the curve to the right of the origin in Fig. 90 can be swung around the origin as a hinge point and it will exactly fit the curve to the left of the origin.

The cosine wave of Fig. 91 is another illustration of a simple periodic function. It is the same as the sine wave except that

$$\begin{aligned}
 y &= M_1 \cos x = M_1 \left[ 1 - \frac{x^2}{2} + \frac{x^4}{24} - \frac{x^6}{720} + \dots \right] \\
 &= M_1 \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n}}{(2n)!}
 \end{aligned} \tag{32}$$

Even or cosine function curve.

FIG. 91.—Cosine wave.

it is shifted to the left  $\pi/2$  radians or 90 degrees to make a function that is symmetrical about the  $y$ -axis. A symmetrical function about the  $y$ -axis is a curve such that if the portion to the right of the  $y$ -axis is swung around the  $y$ -axis as a hinge it will exactly fit the curve to the left of the  $y$ -axis. In a symmetrical function the powers of  $x$  in the series are even numbers.

The variable  $x$  in Eqs. (31) and (32) can be made proportional to a single frequency by the equation

$$x = \omega t = 2\pi f t \tag{33}$$

where  $\omega$  = the angular velocity in radians per second

$f$  = the frequency in cycles per second

$t$  = time in seconds

Since both Eqs. (31) and (32) contain only one frequency, it is known as the first harmonic or fundamental frequency and can be plotted in a frequency spectrum as shown in Figs. 90 and 91. The  $M_1$  is defined as the magnitude of the first harmonic. It

will be noted that both the sine and cosine wave have the same magnitude. The frequency spectrum does not give information as to whether the curve is a sine or a cosine wave.

**Constant Component.**—If a wave is not balanced about the  $x$ -axis—that is, if the area under the curve above the  $x$ -axis is not equal to the area above the curve below the  $x$ -axis—then there will be a steady or constant component. The sine and cosine wave of Figs. 90 and 91 have a zero steady component; in other words, they are balanced about the  $x$ -axis.

For illustration, if the cosine curve of Fig. 91 is raised above the  $x$ -axis as shown in Fig. 92, then there is a steady component of

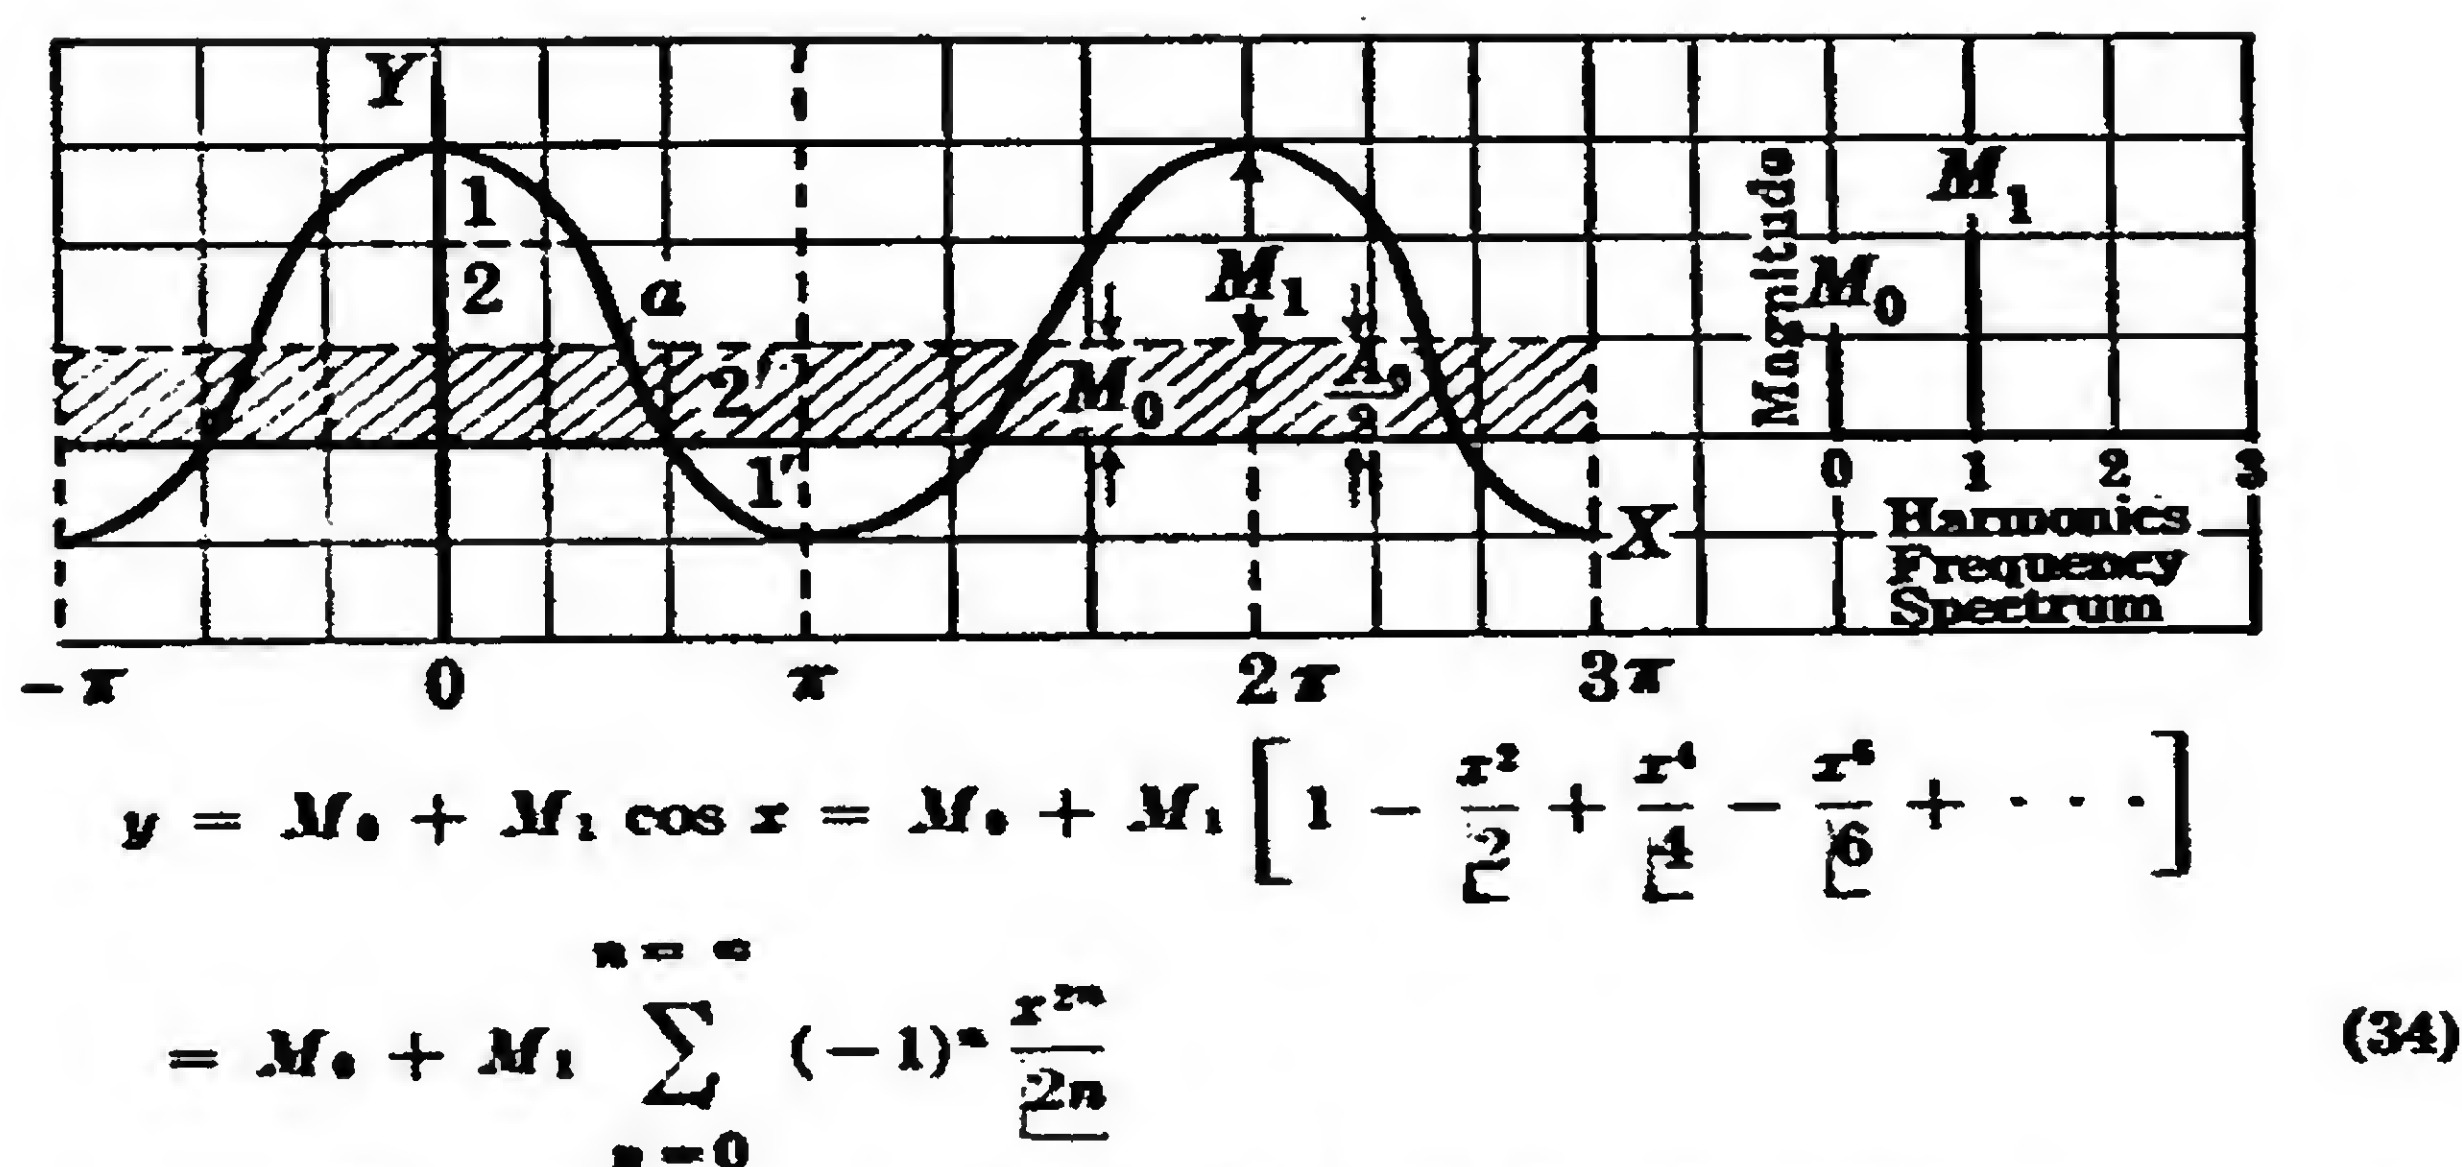

FIG. 92.—Cosine wave plus a constant component.

magnitude  $M_0$ , the height of the shaded area. The cosine wave balances itself about the dashed line as can be seen in the figure. The area marked 1 can be turned around point  $a$  as a hinge and fitted in the area marked 1'. Since the area marked 1 is positive and the area marked 1' is negative, they cancel. Now the area marked 2 above the dashed line if turned around point  $a$  as a hinge will fit into the area marked 2' thus showing that the constant component height is  $M_0$ . The frequency spectrum in Fig. 92 shows a zero frequency magnitude  $M_0$  to represent the constant component. Equation (34) also has this constant component.

**Example 12.** Integrate the curve of Eq. (34) from 0 to  $\pi$ , and show that the average height is  $M_0$ .

**Solution.** The average height is

$$\begin{aligned}
 y_0 &= \frac{\text{area}}{\text{length}} = \frac{A}{\pi} = \frac{1}{\pi} \int_0^{\pi} (M_0 + M_1 \cos x) dx \\
 &= \frac{1}{\pi} \left( M_0 x \Big|_0^{\pi} + M_1 \sin x \Big|_0^{\pi} \right) = \frac{1}{\pi} (M_0 \pi - M_0 0 + M_1 \sin \pi - M_1 \sin 0) \\
 &= \frac{1}{\pi} (M_0 \pi - 0 + 0 - 0) = M_0 \quad \text{Ans.}
 \end{aligned}$$

**Harmonic Components.**—Any periodic wave can be analyzed in terms of a constant and harmonic components. To do this, the magnitude and phase of each component must be properly selected. To illustrate how a square wave can be synthesized, the magnitude and phase will be properly selected to give the correct result. Later a method of determining the values will be given.

Referring to Fig. 93a, we have redrawn one half the sine wave as shown in Fig. 90. The magnitude of this wave is  $M_1 = 4E/\pi$ , as shown in the figure, which represents the magnitude of the fundamental or first harmonic. If the third harmonic  $M_3 \sin 3x$  is added to the first harmonic  $M_1 \sin x$  the resulting wave will be as shown in Fig. 93b. In this case  $M_3 = 4E/3\pi$  which is one third of the magnitude of the fundamental as shown in the frequency spectrum. Since  $x = 2\pi f_1 t$  by Eq. (33) where  $f_1$  represents the first harmonic frequency, then

$$3x = 2\pi(3f_1)t = 2\pi f_3 t \quad (35)$$

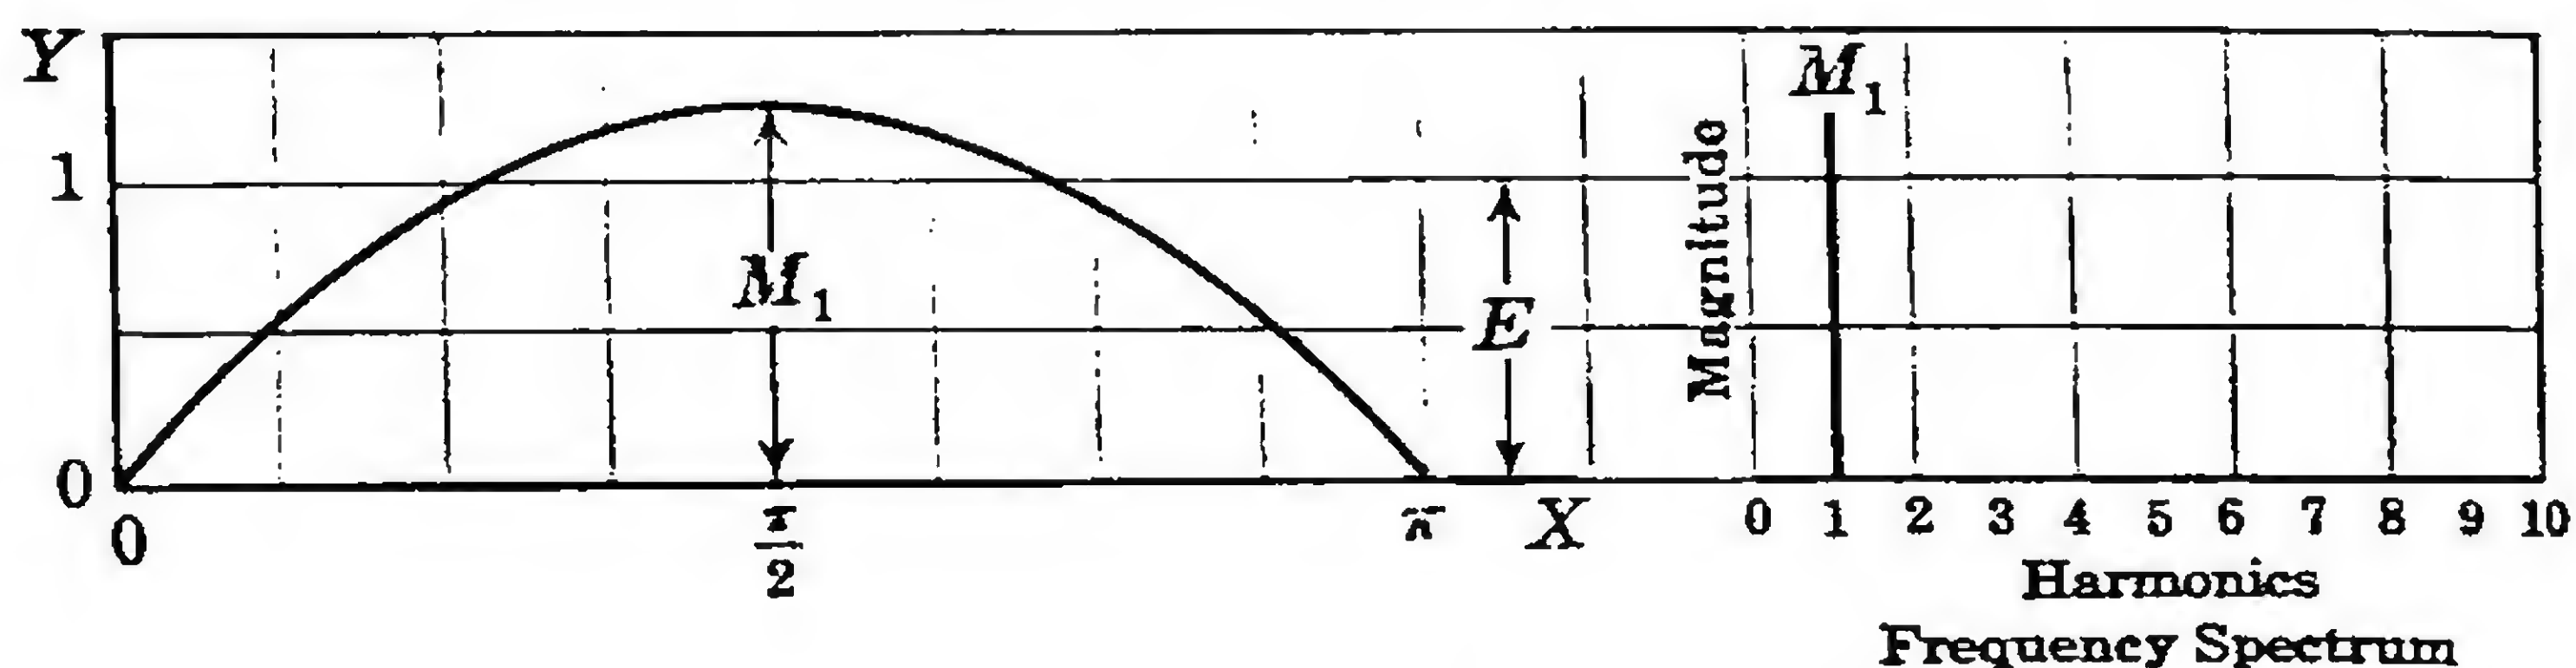

where  $f_3$  = the third harmonic frequency.

If this process of adding odd harmonics of decreasing magnitude is continued the curve approximates closer and closer to that of a square wave as shown in Fig. 93. A careful inspection of Fig. 93 will reveal how the various harmonics add to make closer approximations to a square wave.

**Square Sine and Square Cosine Waves.**—The square sine wave of Fig. 93f has been redrawn in Fig. 94a to show its general shape over more than two periods. It will be noted that this curve is antisymmetrical about the  $y$ -axis and is made up of sine terms, hence is often referred to as a square sine wave.

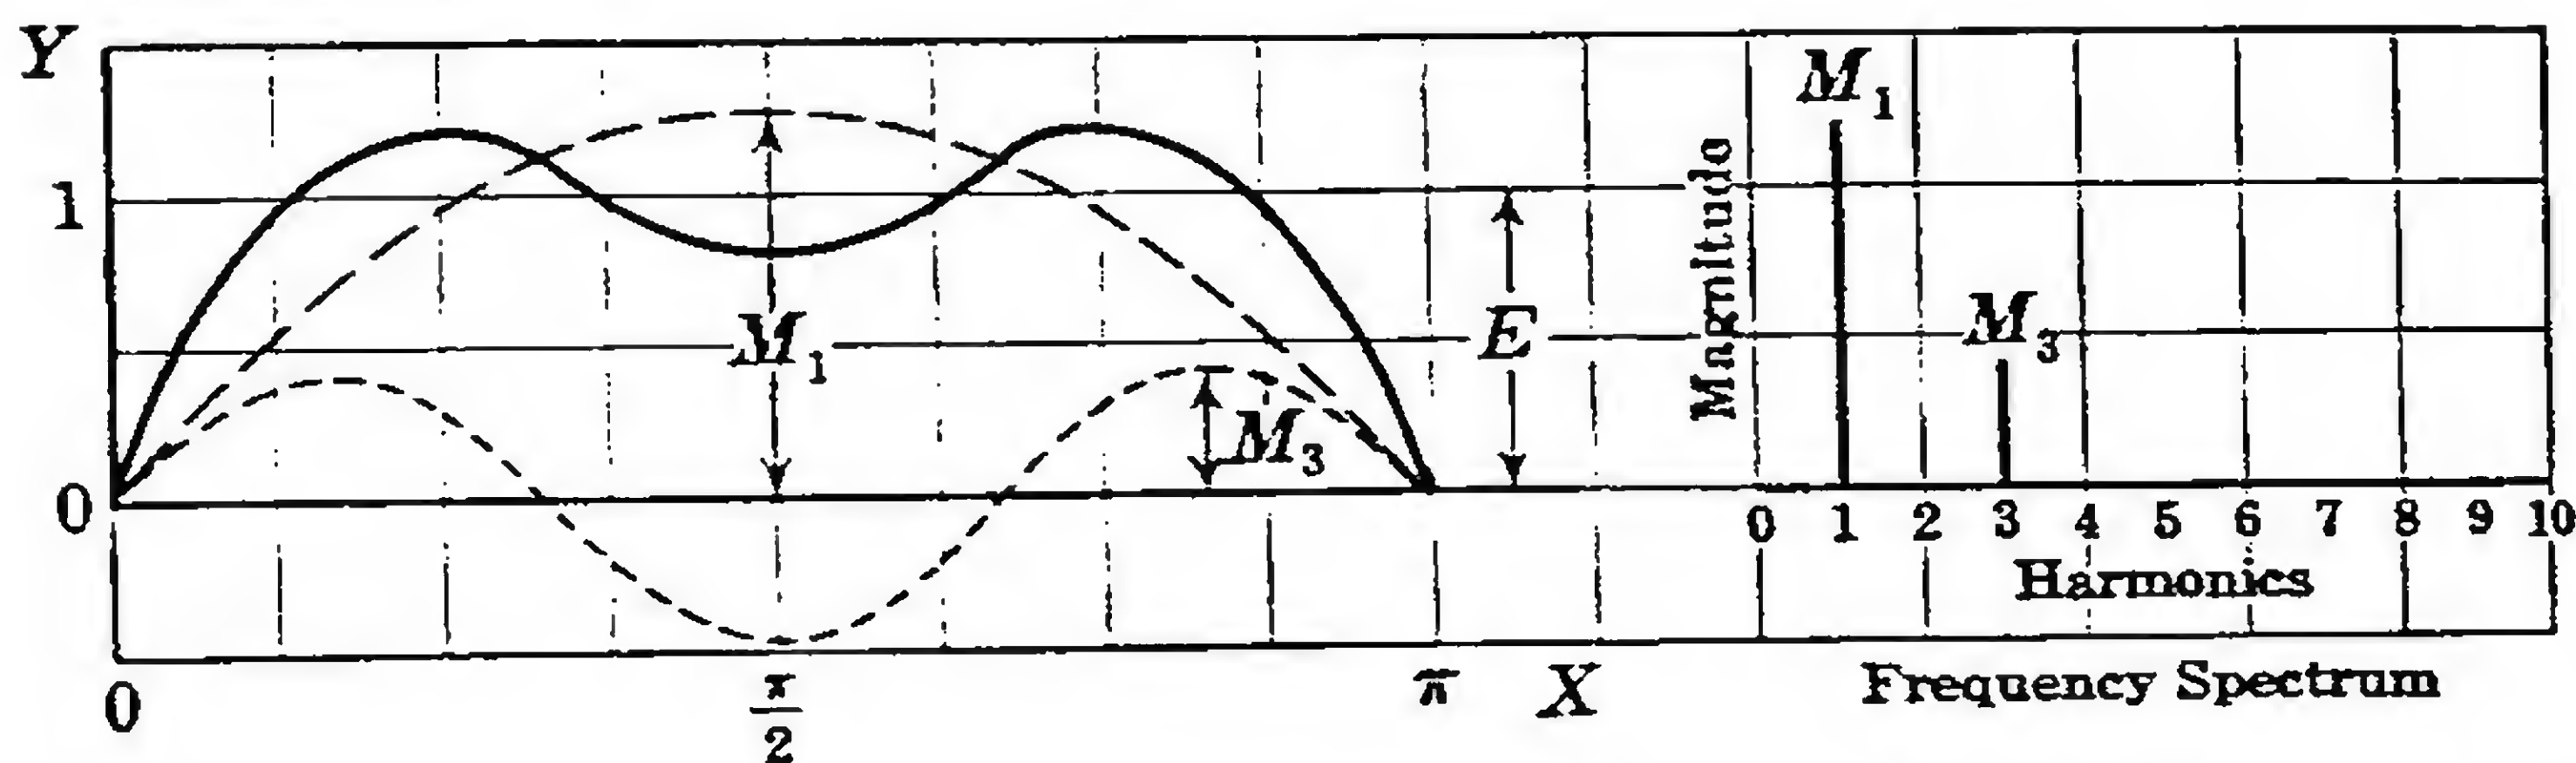

If the square sine wave is moved over so that it is symmetrical about the  $y$ -axis, as shown in Fig. 94b, the terms of the series change from sine to cosine as shown in Eq. (42) and the series is often referred to as a square cosine wave. The reason for the

terms in Eq. (42) can be visualized if the  $y$ -axis of Fig. 93 is imagined shifted to the  $\pi/2$  position which makes the fundamental or first harmonic symmetrical about the new  $y$ -axis, hence,  $\cos x$  which is the first term of Eq. (42). It will be noted in Fig. 93b that the third harmonic is a negative maximum at  $\pi/2$ , hence is written  $-\frac{1}{3} \cos 3x$ , which is the second term in Eq. (42). Continuing this process, the fifth harmonic component is a positive maximum at this midpoint in Fig. 93c. It is therefore

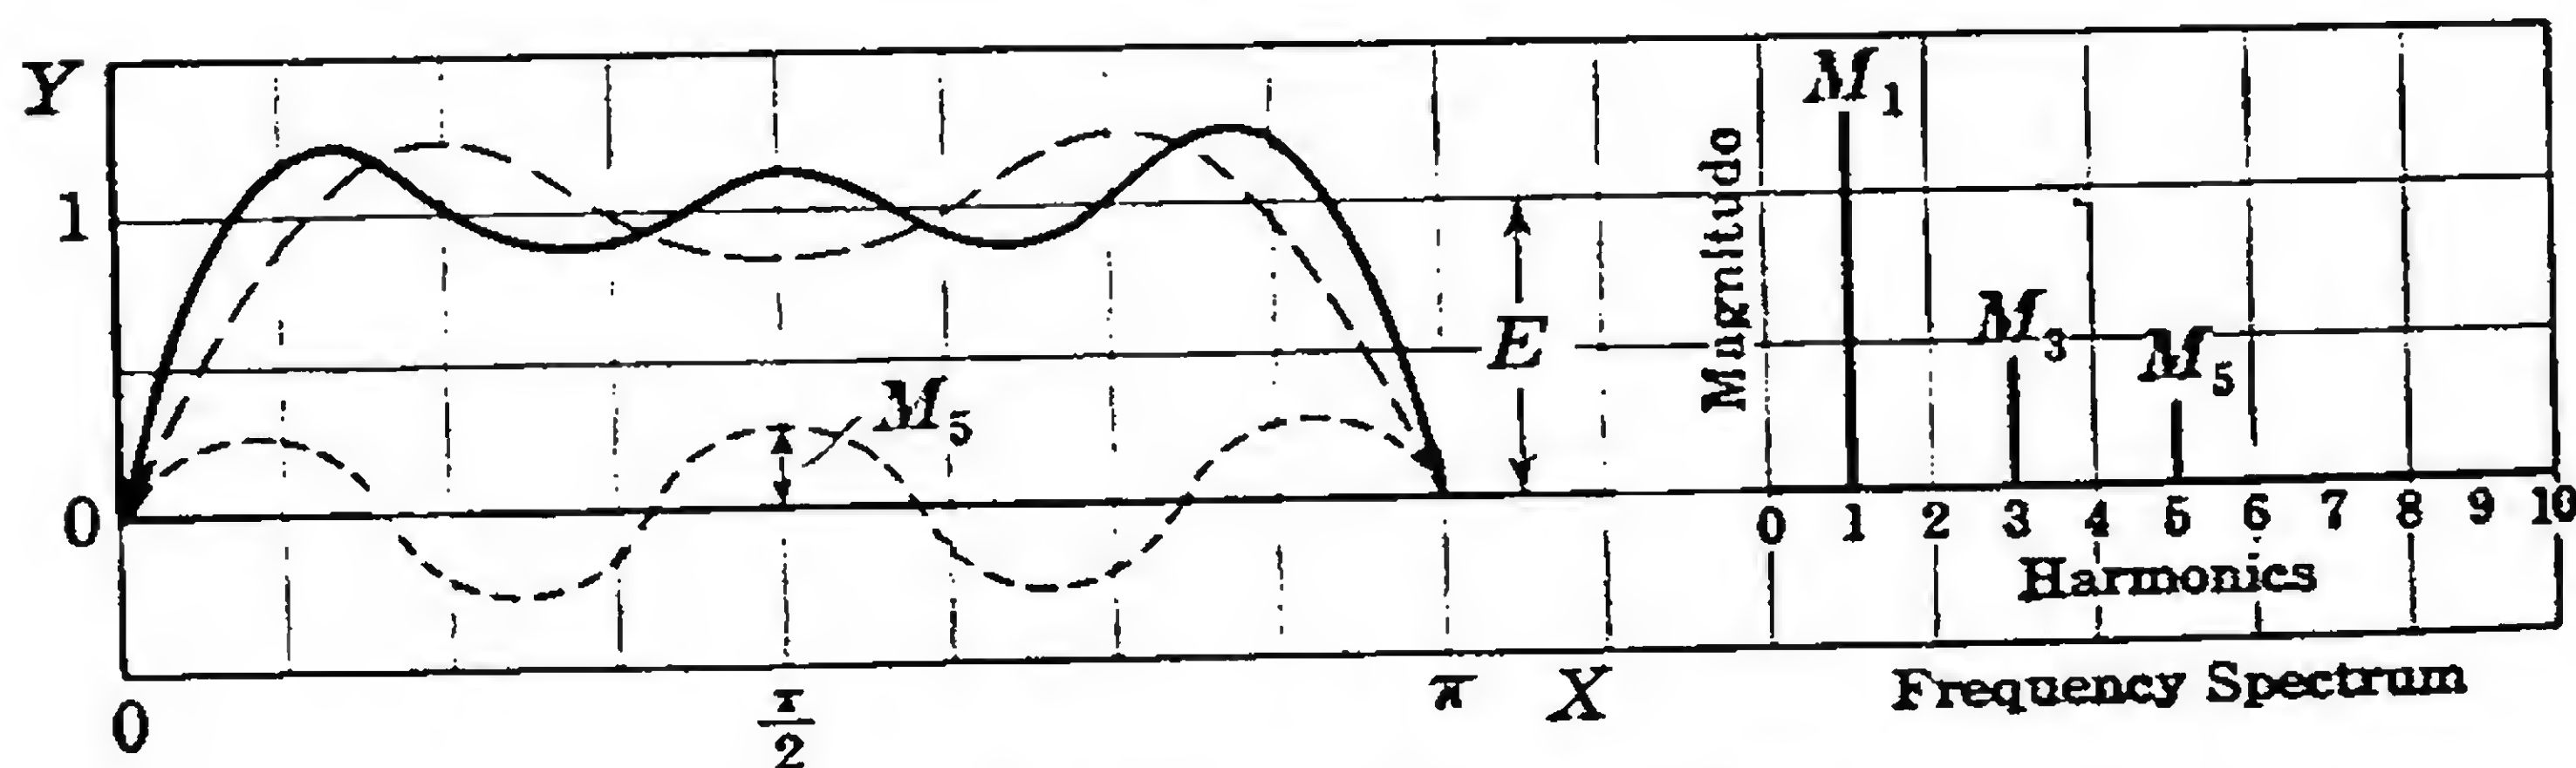

$$y = M_1 \sin x = \frac{4E}{\pi} \sin x \quad (36)$$

a. Fundamental or first harmonic sine wave.

$$y = M_1 \sin x + M_3 \sin 3x = \frac{4E}{\pi} \left( \sin x + \frac{1}{3} \sin 3x \right) \quad (37)$$

b. Fundamental plus third harmonic sine waves.

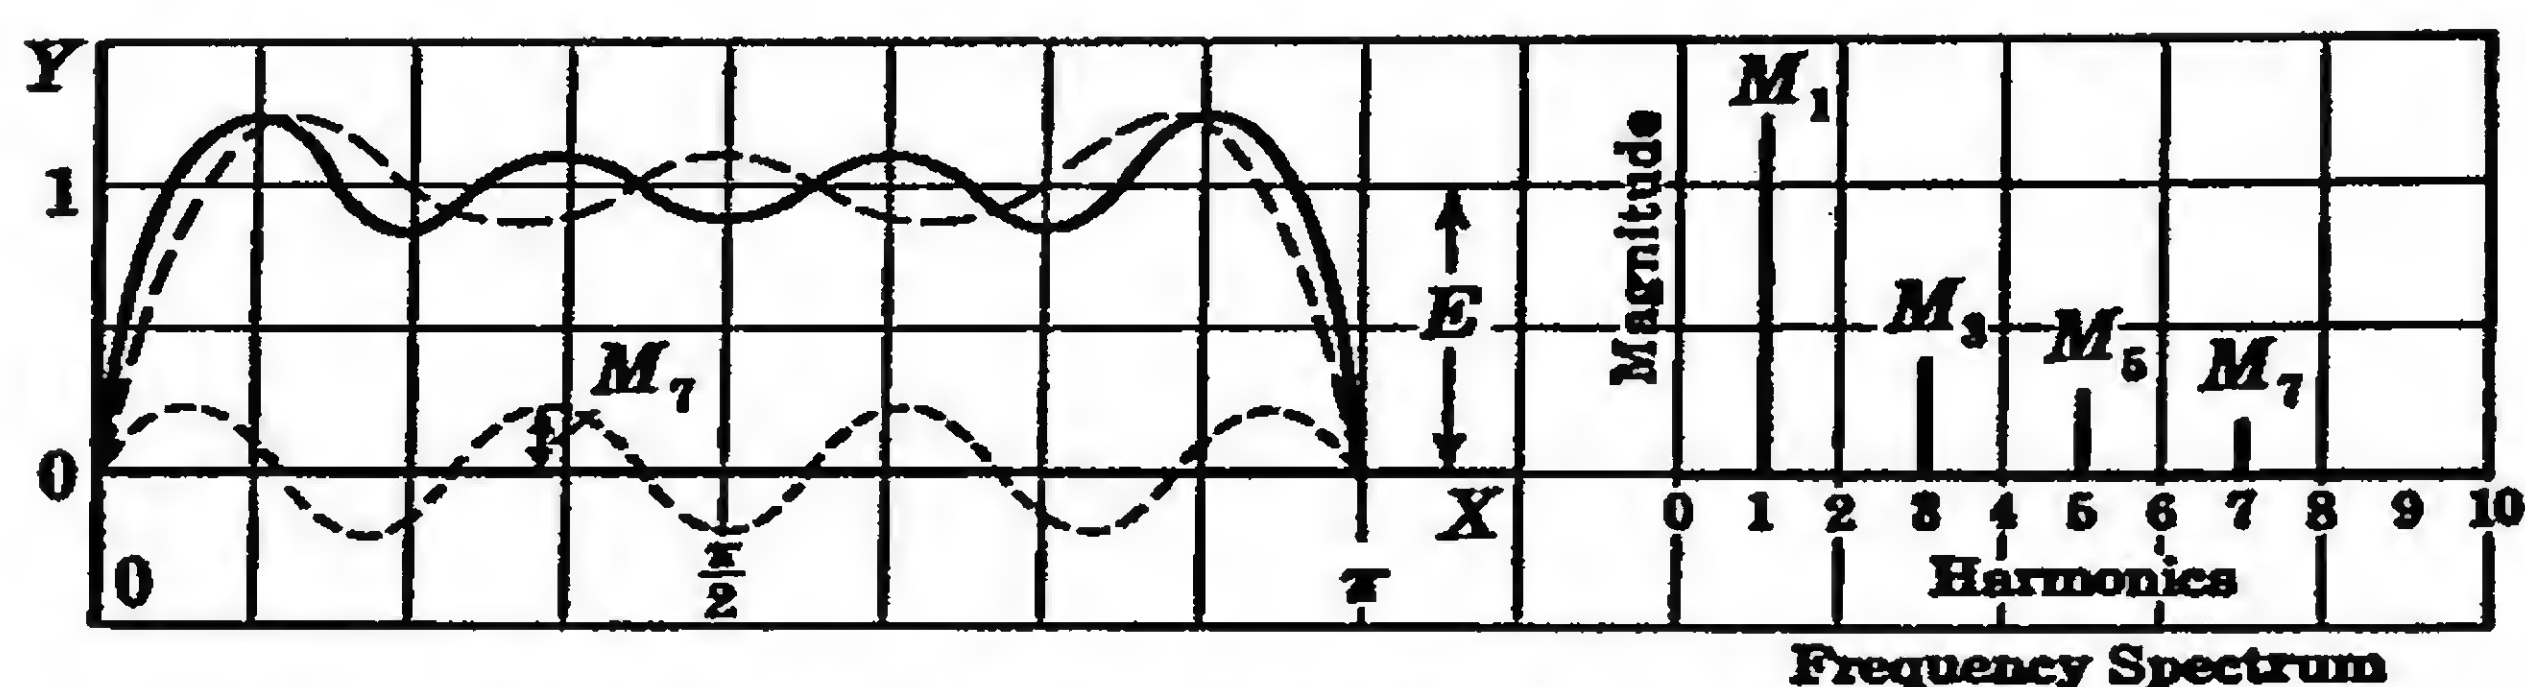

$$\begin{aligned} y &= M_1 \sin x + M_3 \sin 3x + M_5 \sin 5x \\ &= \frac{4E}{\pi} \left( \sin x + \frac{1}{3} \sin 3x + \frac{1}{5} \sin 5x \right) \end{aligned} \quad (38)$$

c. Fundamental plus third and fifth harmonic sine waves.

FIG. 93.—Approximations

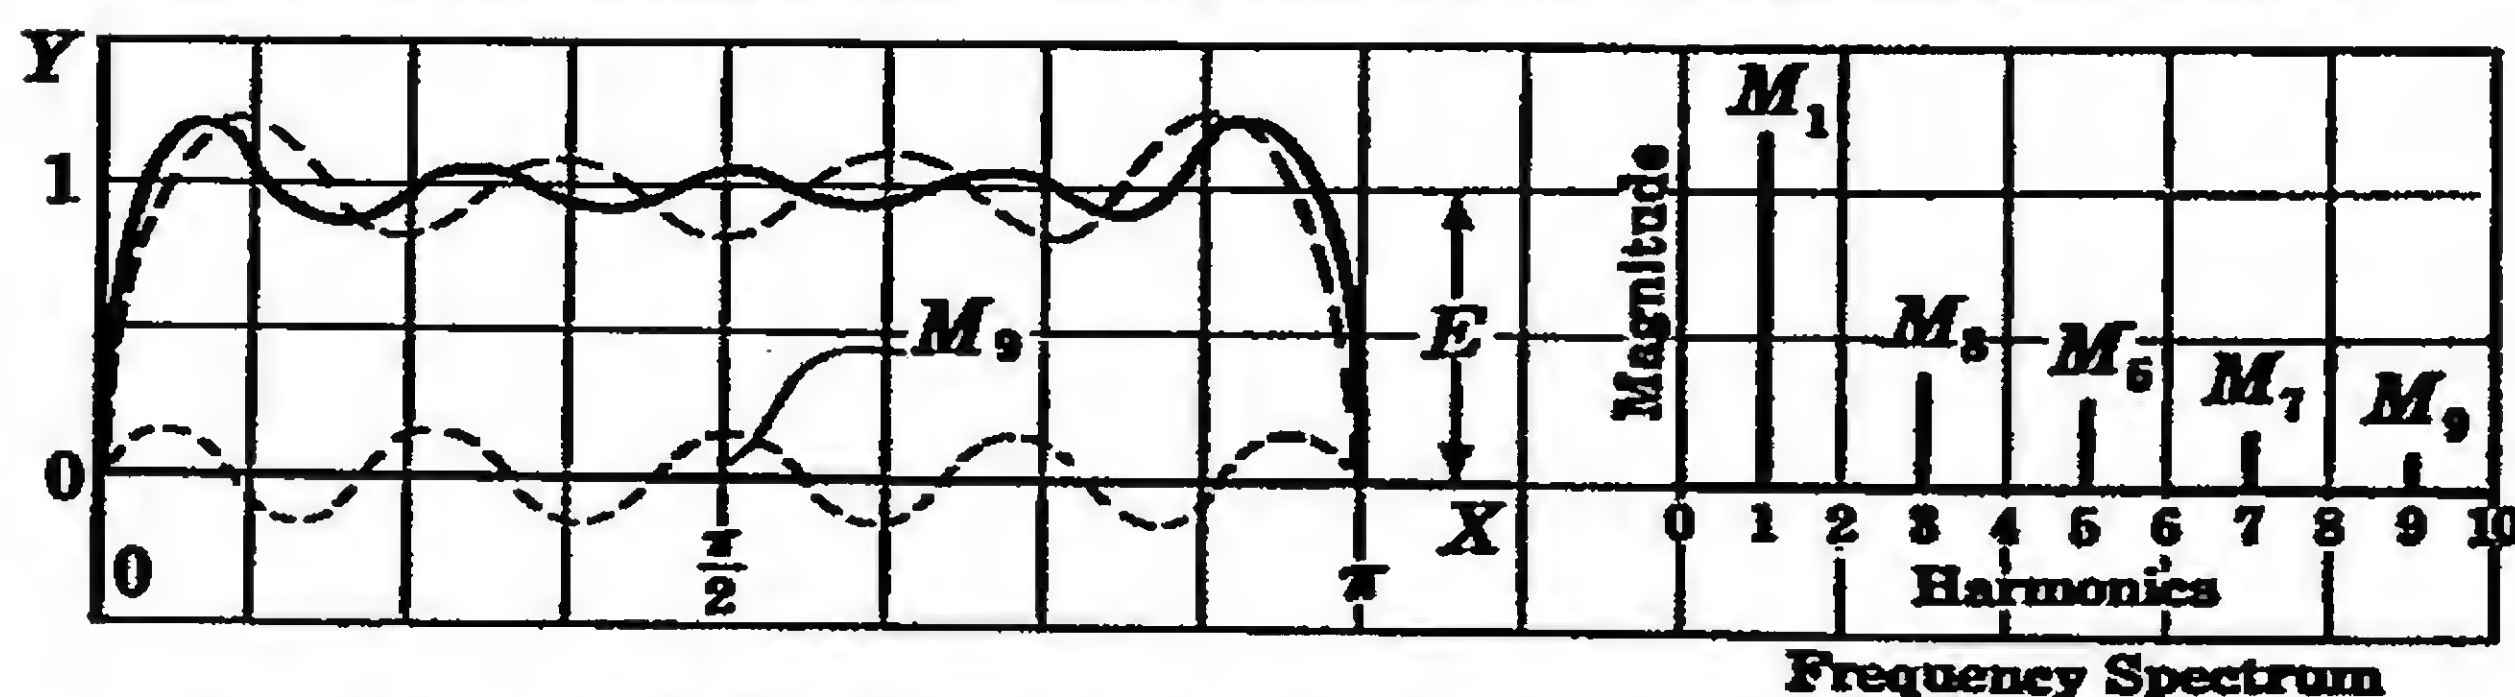

written  $+\frac{1}{5} \cos 5x$  to make up the third term of the series in Eq. (42).

The frequency spectrum is the same for both the square sine and square cosine waves. This is because the series in Eqs. (41) and (42) both have the same values of  $M$ . The fact that they are negative or multiplied by a cosine rather than a sine term does not alter their magnitude, hence the frequency spectrum of Fig. 93f also holds for a square cosine wave.

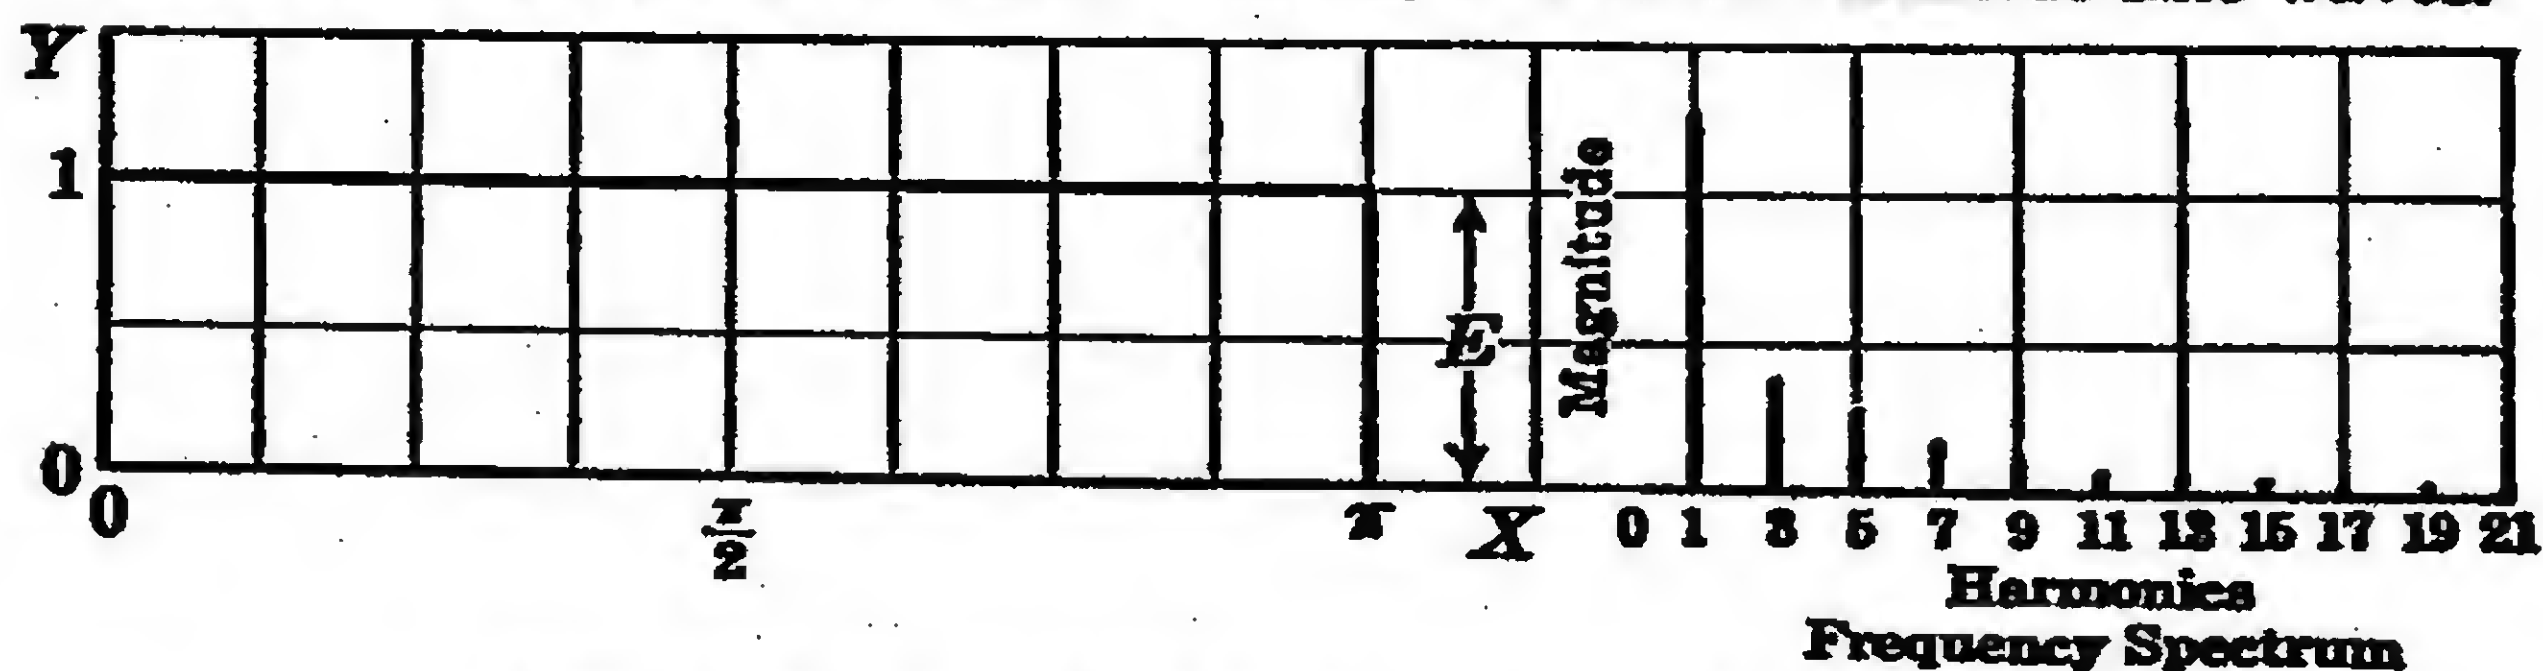

$$\begin{aligned}
 y &= M_1 \sin x + M_3 \sin 3x + M_5 \sin 5x + M_7 \sin 7x \\
 &= \frac{4E}{\pi} \left( \sin x + \frac{1}{3} \sin 3x + \frac{1}{5} \sin 5x + \frac{1}{7} \sin 7x \right)
 \end{aligned} \quad (39)$$

d. Fundamental plus third, fifth, and seventh harmonic sine waves.

$$\begin{aligned}
 y &= M_1 \sin x + M_3 \sin 3x + M_5 \sin 5x + M_7 \sin 7x + M_9 \sin 9x \\
 &= \frac{4E}{\pi} \left( \sin x + \frac{1}{3} \sin 3x + \frac{1}{5} \sin 5x + \frac{1}{7} \sin 7x + \frac{1}{9} \sin 9x \right)
 \end{aligned} \quad (40)$$

e. Fundamental plus third, fifth, seventh, and ninth harmonic sine waves.

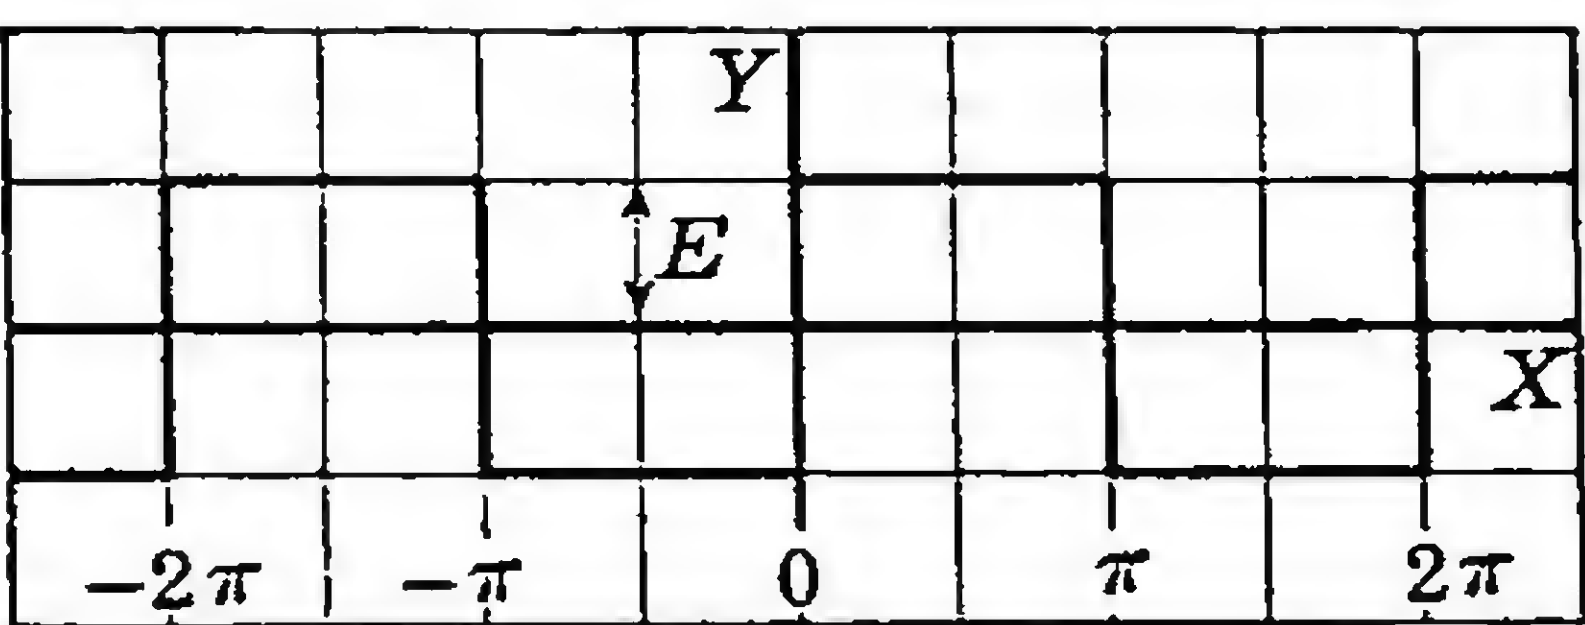

$$\begin{aligned}
 y &= M_1 \sin x + M_3 \sin 3x + M_5 \sin 5x + \dots \\
 &= \frac{4E}{\pi} \left( \sin x + \frac{1}{3} \sin 3x + \frac{1}{5} \sin 5x + \dots \right)
 \end{aligned} \quad (41)$$

f. Square sine wave (fundamental plus all odd harmonics).

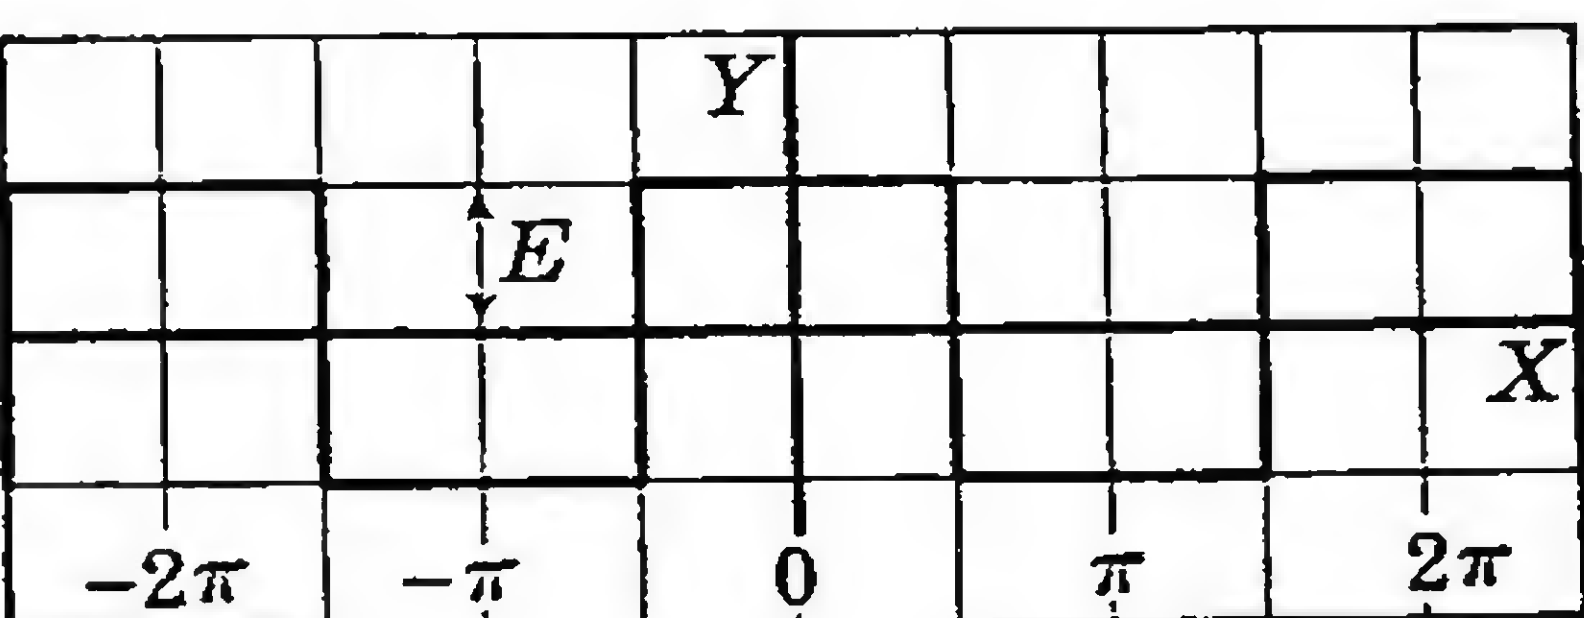

for a square sine wave.

**Fourier Series.**—Thus far, we have examined waves made up of a constant component, harmonic sine components, and harmonic cosine components. Generalizing, the equation for

$$y = \frac{4E}{\pi} \left( \sin x + \frac{1}{3} \sin 3x + \frac{1}{5} \sin 5x + \dots \right) \quad (41)$$

a. Square sine wave.

$$y = \frac{4E}{\pi} \left( \cos x - \frac{1}{3} \cos 3x + \frac{1}{5} \cos 5x - \dots \right) \quad (42)$$

b. Square cosine wave.

FIG. 94.—Comparison of square sine and square cosine waves.

any periodic wave can be written by substituting the proper values in *Fourier's series*, which is written as follows:

$$y = f(x) = \frac{A_0}{2} + A_1 \cos x + A_2 \cos 2x + A_3 \cos 3x + \dots + B_1 \sin x + B_2 \sin 2x + B_3 \sin 3x + \dots \quad (43)$$

Since this equation can be used to express any periodic wave, the major task reduces to that of finding the values of the  $A$  and  $B$  terms. In the previous illustrations the values of the  $A$  and  $B$  terms were furnished. In Eq. (31)  $B_1 = M_1$  and all other  $A$  and  $B$  terms of Eq. (43) are zero. In Eq. (32)  $M_1 = A_1$  with all other  $A$  and  $B$  terms zero in Eq. (43). In Eq. (34)  $\frac{A_0}{2} = M_0$  and  $A_1 = M_1$ , with all other terms in Fourier's series equal to zero. In Eq. (41) all of the  $A$  terms are zero and all of the odd  $B$  terms exist.

Then in Eq. (42) all the  $B$  terms are zero and all but the  $A_0$  and even  $A$  terms exist.

If the shape of the desired curve is known, it is possible to determine the value of the  $A$  and  $B$  terms by the following definite integrals. The integrals are followed by a word statement of their meaning. The constant or zero frequency component is

$$\begin{aligned} A_0 &= \frac{1}{\pi} \int_0^{2\pi} y \, dx \\ &= 2 \left( \begin{array}{l} \text{average value of } y \\ \text{taken over one period} \\ \text{or cycle} \end{array} \right) \end{aligned} \quad (44)$$

The  $n$ th cosine term of the  $n$ th harmonic is

$$\begin{aligned} A_n &= \frac{1}{\pi} \int_0^{2\pi} y \cos nx \, dx \\ &= 2 \left( \begin{array}{l} \text{average value of } y \cos nx \\ \text{taken over one period or} \\ \text{cycle} \end{array} \right) \end{aligned} \quad (45)$$

The  $n$ th sine term of the  $n$ th harmonic is

$$\begin{aligned} B_n &= \frac{1}{\pi} \int_0^{2\pi} y \sin nx \, dx \\ &= 2 \left( \begin{array}{l} \text{average value of } y \sin nx \\ \text{taken over one period or} \\ \text{cycle} \end{array} \right) \end{aligned} \quad (46)$$

If  $n = 0$  in Eq. (45),  $\cos 0 \cdot x = 1$  and the equation reduces to Eq. (44). If  $n = 0$  in Eq. (46),  $\sin 0 \cdot x = 0$  and the value is zero. That is the reason for the absence of the  $B_0$  term in Eq. (43).

**Example 13.** Determine the  $A$  and  $B$  terms for the wave illustrated in Fig. 92.

**Solution.** Substituting in Eq. (44) the value of  $y$  given in Eq. (34) for the cosine wave above the  $x$ -axis, we have for the  $A_0$  term

$$\begin{aligned} A_0 &= \frac{1}{\pi} \int_0^{2\pi} y \, dx = \frac{1}{\pi} \int_0^{2\pi} (M_0 + M_1 \cos x) \, dx \\ &= \frac{1}{\pi} \int_0^{2\pi} M_0 \, dx + \frac{1}{\pi} \int_0^{2\pi} M_1 \cos x \, dx = \frac{1}{\pi} M_0 x \Big|_0^{2\pi} + \frac{1}{\pi} M_1 \sin x \Big|_0^{2\pi} \\ &= \frac{1}{\pi} (M_0 \cdot 2\pi - M_0 \cdot 0) + \frac{1}{\pi} (0 - 0) = 2M_0 \quad \text{Ans.} \end{aligned}$$

For the  $A_1$  term we have

$$\begin{aligned}
 A_1 &= \frac{1}{\pi} \int_0^{2\pi} y \cos x \, dx = \frac{1}{\pi} \int_0^{2\pi} (M_0 + M_1 \cos x) \cos x \, dx \\
 &= \frac{1}{\pi} \int_0^{2\pi} M_0 \cos x \, dx + \frac{1}{\pi} \int_0^{2\pi} M_1 \cos^2 x \, dx \\
 &= \frac{1}{\pi} M_0 \sin x \Big|_0^{2\pi} + \frac{1}{\pi} \int_0^{2\pi} M_1 \frac{1}{2} (1 + \cos 2x) \, dx \\
 &= \frac{1}{\pi} M_0 (0 - 0) + \frac{1}{\pi} M_1 \frac{1}{2} \left( \int_0^{2\pi} dx + \int_0^{2\pi} \cos 2x \, dx \right) \\
 &= \frac{1}{\pi} M_1 \frac{1}{2} \left[ (2\pi - 0) - \frac{1}{2} \sin 2x \Big|_0^{2\pi} \right] = M_1 \quad \text{Ans.}
 \end{aligned}$$

All other  $A$  and  $B$  terms are zero, so these substitutions can be made in Eq. (43) to get the complete equation of the wave, thus

$$y = \frac{A_0}{2} + A_1 \cos x = \frac{2M_0}{2} + M_1 \cos x = M_0 + M_1 \cos x \quad \text{Ans.}$$

The value of  $y$  can often be expressed by a simple equation over various portions of the period. In such cases the integration can be added over these various portions. This is illustrated in the following example:

*Example 14.* Determine two  $A$  and three  $B$  terms for a square sine wave of amplitude  $E$ .

*Solution.* Referring to Fig. 94a,  $y = E$  from  $x = 0$  to  $x = \pi$  and  $y = -E$  from  $x = \pi$  to  $x = 2\pi$ .

Substituting these values in Eq. (44) for  $A_0$ ,

$$\begin{aligned}
 A_0 &= \frac{1}{\pi} \int_0^{\pi} E \cos 0 \cdot x \, dx + \frac{1}{\pi} \int_{\pi}^{2\pi} (-E \cos 0 \cdot x) \, dx \\
 &= \frac{1}{\pi} E x \Big|_0^{\pi} - \frac{1}{\pi} E x \Big|_{\pi}^{2\pi} \\
 &= \frac{1}{\pi} E \pi - \frac{1}{\pi} E (2\pi - \pi) = 0 \quad \text{Ans.}
 \end{aligned}$$

This means that the wave is balanced around the  $x$ -axis. Substituting the above values in Eq. (45) for  $A_1$ ,

$$\begin{aligned}
 A_1 &= \frac{1}{\pi} \int_0^{\pi} E \cos x \, dx + \frac{1}{\pi} \int_{\pi}^{2\pi} (-E \cos x) \, dx \\
 &= \frac{1}{\pi} E \sin x \Big|_0^{\pi} - \frac{1}{\pi} E \sin x \Big|_{\pi}^{2\pi} \\
 &= \frac{1}{\pi} E (0 - 0) - \frac{1}{\pi} E (0 - 0) = 0 \quad \text{Ans.}
 \end{aligned}$$

Since the sign of any multiple of  $\pi$  is zero, all the rest of the  $A_n$  terms in Eq. (43) will be zero.

Substituting the above values in Eq. (46) for  $B_1$ ,

$$\begin{aligned} B_1 &= \frac{1}{\pi} \int_0^{2\pi} y \sin x \, dx = \frac{1}{\pi} \int_0^{\pi} E \sin x \, dx + \frac{1}{\pi} \int_{\pi}^{2\pi} (-E \sin x) \, dx \\ &= \frac{E}{\pi} (-\cos x) \Big|_0^{\pi} + \frac{E}{\pi} \cos x \Big|_{\pi}^{2\pi} \\ &= \frac{E}{\pi} (1 + 1) + \frac{E}{\pi} (1 + 1) = \frac{4E}{\pi} \quad \text{Ans.} \end{aligned}$$

Substituting the above values in Eq. (46) for  $B_2$ ,

$$\begin{aligned} B_2 &= \frac{1}{\pi} \int_0^{2\pi} y \sin 2x \, dx = \frac{1}{\pi} \int_0^{\pi} E \sin 2x \, dx + \frac{1}{\pi} \int_{\pi}^{2\pi} (-E \sin 2x) \, dx \\ &= \frac{E}{2\pi} (-\cos 2x) \Big|_0^{\pi} + \frac{E}{2\pi} (\cos 2x) \Big|_{\pi}^{2\pi} = \frac{E}{2\pi} (-1 + 1) + \frac{E}{2\pi} (1 - 1) = 0 \\ &\hspace{15em} \text{Ans.} \end{aligned}$$

Since the cosine of any even multiple of  $\pi$  results in zero over these limits, all the rest of the even  $B_n$  terms in Eq. (43) will be zero.

Substituting the above values in Eq. (46) for  $B_3$ ,

$$\begin{aligned} B_3 &= \frac{1}{\pi} \int_0^{2\pi} y \sin 3x \, dx = \frac{1}{\pi} \int_0^{\pi} E \sin 3x \, dx + \frac{1}{\pi} \int_{\pi}^{2\pi} (-E \sin 3x) \, dx \\ &= \frac{E}{3\pi} (-\cos 3x) \Big|_0^{\pi} - \frac{E}{3\pi} (-\cos 3x) \Big|_{\pi}^{2\pi} \\ &= \frac{E}{3\pi} (+1 + 1) - \frac{E}{3\pi} (-1 - 1) = \frac{4E}{3\pi} \quad \text{Ans.} \end{aligned}$$

This indicates that only odd  $B$  terms will have values in Eq. (43). Now, substituting the above values in Eq. (43) gives two terms of the series, thus

$$y = \frac{4E}{\pi} \left( \sin x + \frac{1}{3} \sin 3x + \dots \right) \quad \text{Ans.}$$

**Magnitude and Phase of Harmonic Components.**—The corresponding terms in Fourier's series of Eq. (43) can be combined into single terms, by using the equation

$$M_n \sin (n\omega t + \psi_n) = A_n \cos n\omega t + B_n \sin n\omega t \quad (47)$$

where, as shown in Fig. 95,

$$M_n = \sqrt{A_n^2 + B_n^2} \quad (48)$$

$$\cos \psi_n = \frac{B_n}{M_n} \quad (49)$$

$$\sin \psi_n = \frac{A_n}{M_n} \quad (50)$$

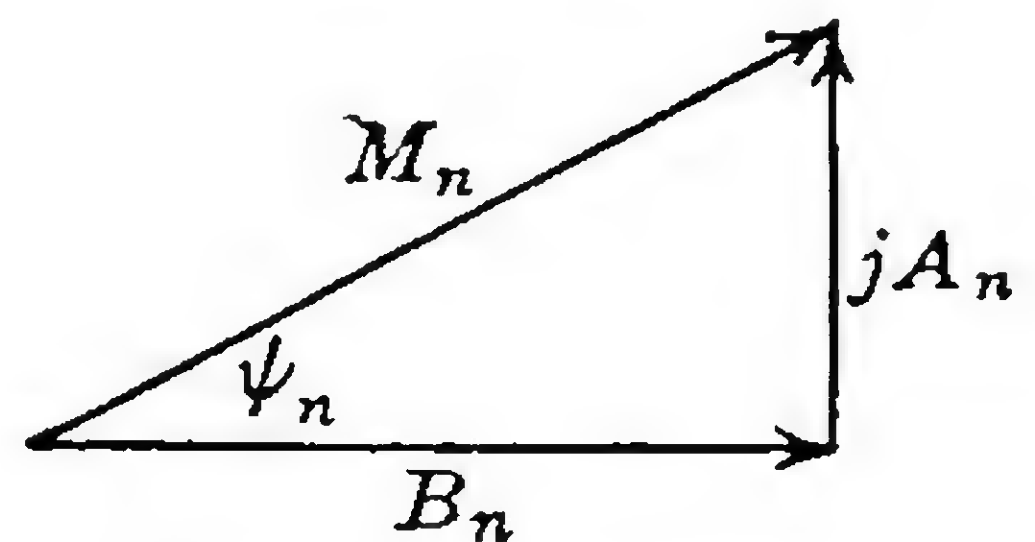

FIG. 95.—Relation of phase and magnitude of an  $n$ th harmonic component.

To prove Eq. (47), consider the trigonometric identity

$$\sin (a + b) = \sin b \cos a + \cos b \sin a,$$

and let  $a = n\omega t$ ,  $b = \psi_n$ ; then

$$\sin (n\omega t + \psi_n) = \sin \psi_n \cos n\omega t + \cos \psi_n \sin n\omega t$$

Now substituting the value of  $\sin \psi_n$  and  $\cos \psi_n$  as given in Eqs. (49) and (50) and multiplying both sides by  $M_n$  results in Eq. (47) and completes the proof.

Fourier's series of Eq. (43) can, with the use of Eq. (47), be converted to read

$$y = f(x) = M_0 + M_1 \sin (\omega t + \psi_1) + M_2 \sin (2\omega t + \psi_2) + \dots$$

$$= M_0 + \sum_{n=1}^{n=\infty} M_n \sin (n\omega t + \psi_n) \quad (51)$$

Since  $M_0$  of this series equals  $\frac{A_0}{2}$  of the original series, it can be evaluated by converting the definite integral of Eq. (44) to read

$$M_0 = \frac{1}{2\pi} \int_0^{2\pi} y \, dx$$

$$= \left( \begin{array}{l} \text{average value of } y \text{ taken} \\ \text{over one period or cycle} \end{array} \right) \quad (52)$$

In this equation the integral gives the area under the curve from 0 to  $2\pi$ . This area can be converted to an equivalent rectangle having a base of  $2\pi$  and an altitude of  $M_0$ , hence as given in Eq. (52), the altitude of the rectangle is

$$M_0 = \frac{\text{area of equivalent rectangle}}{\text{base of rectangle}} \quad (53)$$

By using the vectors of Fig. 95, it is possible to express the magnitude ( $M$ ) term and phase angle ( $\psi$ ) term by a definite integral. Multiplying both sides of Eq. (45) by  $j$  and adding to Eq. (46) gives, for  $n = 1, 2, 3 \dots$ ,

$$M_n \angle \psi_n = B_n + jA_n$$

$$= \frac{1}{\pi} \int_0^{2\pi} y(\sin nx + j \cos nx) \, dx$$

$$= \frac{j}{\pi} \int_0^{2\pi} y(\cos nx - j \sin nx) \, dx$$

$$= \frac{j}{\pi} \int_0^{2\pi} y e^{-jnx} \, dx$$

$$= 2 \left( \begin{array}{l} \text{average value of } y e^{-jnx} \\ \text{taken over one period} \\ \text{or cycle} \end{array} \right) \left( \begin{array}{l} \text{phase angle of} \\ nth \text{ harmonic} \end{array} \right) \quad (54)$$

In other words, this equation states that

$$M_n \angle \psi_n = 2 \left( \frac{\text{area of equivalent rectangle}}{\text{base of rectangle}} \right) \left( \text{phase angle of } n\text{th harmonic} \right) \quad (55)$$

The area of the equivalent rectangle is given by the integral, which also gives an angle. The base of the rectangle is  $2\pi$ , hence  $M_n$  is twice the altitude of the rectangle. The angle given by the integral when multiplied by  $j$  gives the phase term.

**Example 15.** Determine the first harmonic term for a square sine wave of amplitude  $E$ .

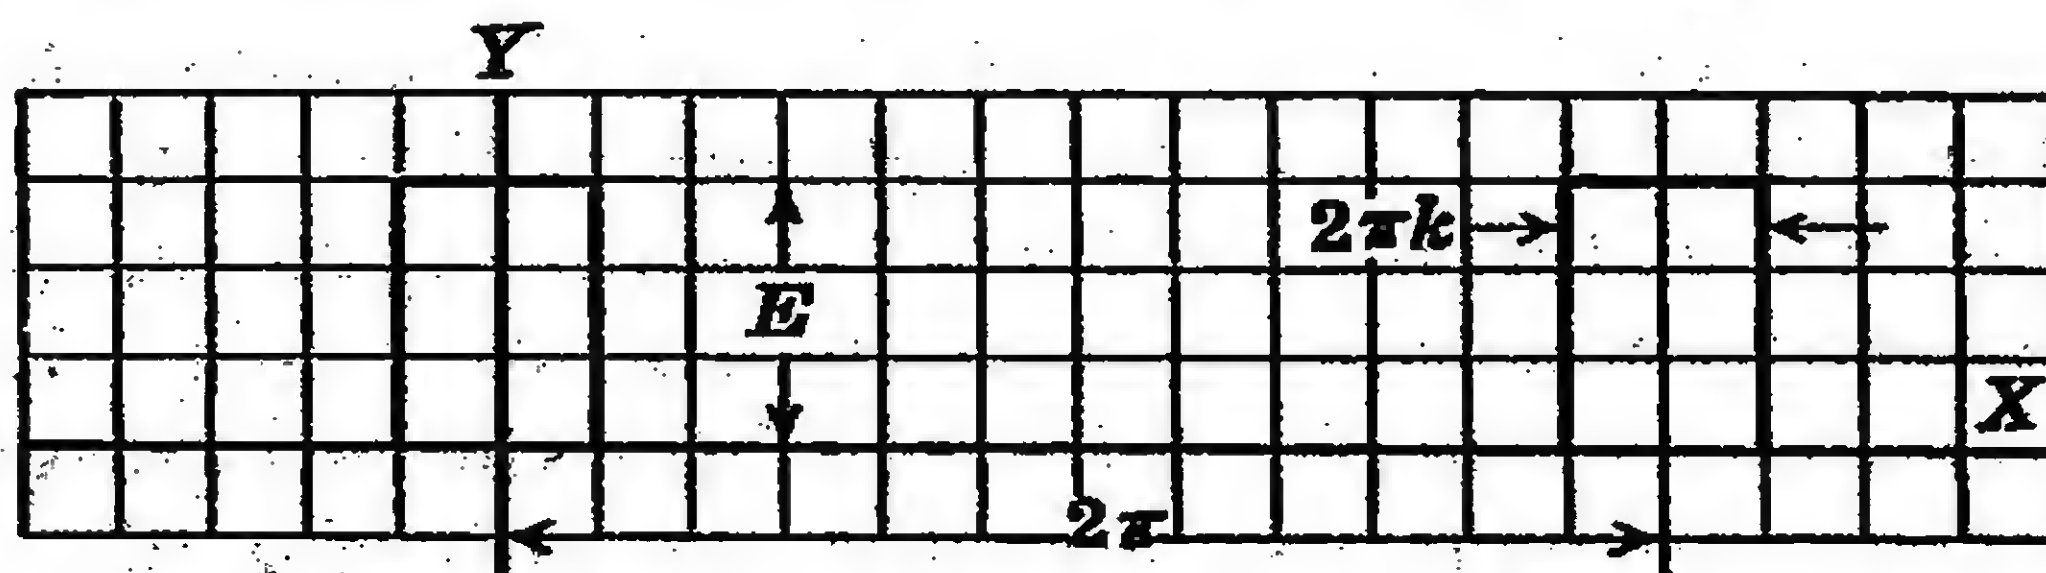

**Solution.** Dividing the integral of Eq. (54) into two parts, the first from 0 to  $\pi$  and the second from  $\pi$  to  $2\pi$ , results in

$$\begin{aligned} M_1/\psi_1 &= \frac{j}{\pi} \int_0^{\pi} E e^{-jx} dx + \frac{j}{\pi} \int_{\pi}^{2\pi} -E e^{-jx} dx \\ &= -\frac{E}{\pi} e^{-jx} \Big|_0^{\pi} + \frac{E}{\pi} e^{-jx} \Big|_{\pi}^{2\pi} \\ &= -\frac{E}{\pi} e^{-j\pi} + \frac{E}{\pi} e^0 + \frac{E}{\pi} e^{-j2\pi} - \frac{E}{\pi} e^{-j\pi} \\ &= \frac{E}{\pi} \angle 0^\circ + \frac{E}{\pi} \angle 0^\circ + \frac{E}{\pi} \angle 0^\circ + \frac{E}{\pi} \angle 0^\circ = \frac{4E}{\pi} \angle 0^\circ \end{aligned}$$

The second term in Eq. (51) is then

$$M_1 \sin(\omega t + \psi_1) = \frac{4E}{\pi} \sin(\omega t + 0) = \frac{4E}{\pi} \sin \omega t \quad \text{Ans.}$$

This checks the solution for the first harmonic term in Example 14, which used  $x$  in place of  $\omega t$ . Since  $\psi_1 = 0^\circ$ , the  $j$  component is absent and the  $B_n$  term of Eq. (54) is equal to  $\frac{4E}{\pi}$ .

$$\begin{aligned} y &= kE + \frac{2E}{\pi} \left( \sin \pi k \cos x + \frac{1}{2} \sin 2\pi k \cos 2x + \dots \right) \\ &= kE + \frac{2E}{\pi} \sum_{n=1}^{\infty} \frac{1}{n} \sin n\pi k \cos nx \end{aligned} \quad (56)$$

FIG. 96.—Short rectangular pulse.

**Example 16.** Evaluate the first two terms for a short rectangular pulse as shown in Fig. 96.

*Solution.* By Eq. (52),

$$M_0 = \frac{1}{2\pi} \int_{-\pi k}^{+\pi k} E dx = \frac{E}{2\pi} x \Big|_{-\pi k}^{+\pi k} = kE \quad \text{Ans.}$$

Checking by Eq. (53),

$$M_0 = \frac{(2\pi k)(E)}{2\pi} = kE \quad \text{Check.}$$

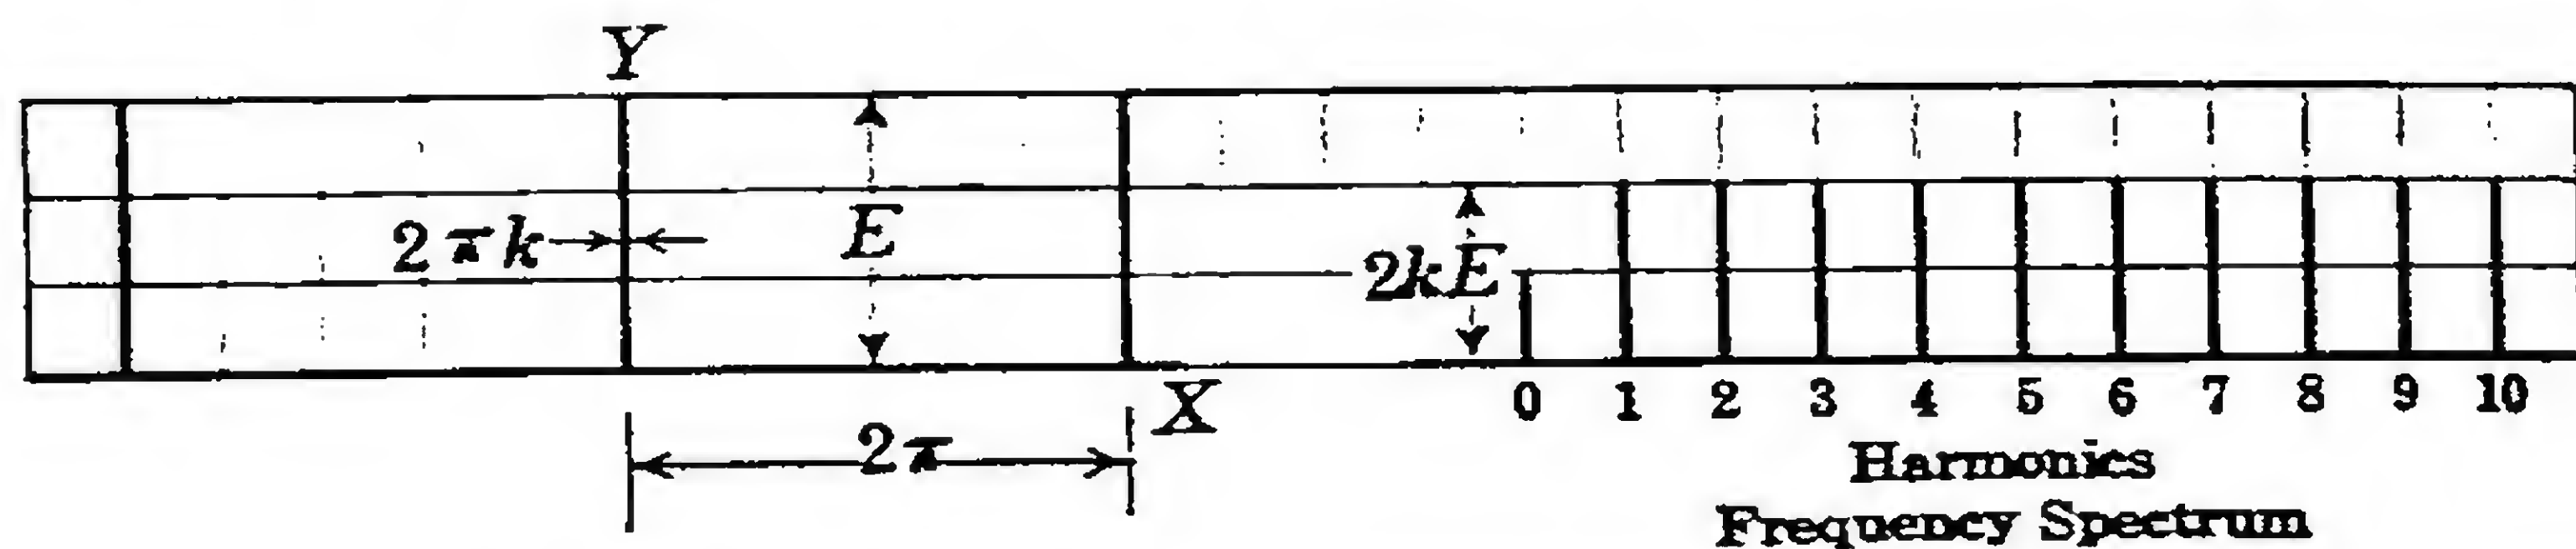

By Eq. (54),

$$\begin{aligned} M_1/\psi_1 &= \frac{j}{\pi} \int_{-\pi k}^{+\pi k} E e^{-jx} dx = \frac{-E}{\pi} e^{-jx} \Big|_{-\pi k}^{+\pi k} \\ &= \frac{2Ej}{\pi} \frac{e^{j\pi k} - e^{-j\pi k}}{2j} = \frac{2E}{\pi} \sin \pi k / 90^\circ \end{aligned}$$

Hence, substituting in Eq. (51),

$$\begin{aligned} M_1 \sin(x + \psi_1) &= \frac{2E}{\pi} \sin \pi k \sin(x + 90^\circ) \\ &= \frac{2E}{\pi} \sin \pi k \cos x \quad \text{Ans.} \end{aligned}$$

A square cosine wave was illustrated in Fig. 94b. It is a special case of the short rectangular pulse of Fig. 96. If  $k = \frac{1}{2}$  and the  $M_0$  term is made zero, Eq. (56) reduces to Eq. (42).

$$y = kE + 2kE(\cos x + \cos 2x + \cos 3x + \dots) \quad (57)$$

FIG. 97.—Thin line pulse.

**Thin Line Pulse.**—Another case of interest is to narrow the width of the rectangular pulse until it is essentially a single line pulse. As the pulse width of Fig. 96 is made narrow  $k$  becomes very small, with the result that for small values of  $n$  the term  $\sin n\pi k \doteq n\pi k$  in Eq. (56). With this substitution Eq. (56) can be expressed as Eq. (57), which is illustrated in Fig. 97. It is interesting to note that the harmonics have the same magnitude, hence giving a frequency spectrum as shown in Fig. 97. If this series is carried to a very large number of terms, the pulse width must be very small for the above approximation to hold with reasonable accuracy. Also, the value of each harmonic component will be very small. The height of the pulse will be approximately the sum of the harmonic components. It is of importance to note that all harmonics are present and of equal amplitude in the frequency spectrum of Fig. 97.

## Exercises

1. Write the  $n$ th term for the series

$$S_n = x + \frac{x^2}{1} + \frac{x^3}{1 \cdot 2} + \frac{x^4}{1 \cdot 2 \cdot 3} + \dots$$

and test the series for convergence or divergence.

2. Test the series  $S_n = \frac{1}{1} + \frac{1}{(\sqrt{2})^3} + \frac{1}{(\sqrt{3})^3} + \dots$

for convergence or divergence and write the  $n$ th term.

3. Test ratio the series  $S_n = 1 + \frac{1}{1} + \frac{1}{2} + \frac{1}{3} + \dots$

4. Find the approximate value of  $\sqrt{37}$  by applying the binomial series.

5. Expand the function  $\sin x$  into a series.

6. What is the third approximation value of  $\frac{\sin x}{1-x}$ ?

7. Give the second approximation value of  $e^{2.1}$  when  $e^2 = 7.3891$  and note the error.

8. Determine the third harmonic term for a square sine wave of amplitude  $E$ .

9. Evaluate the second harmonic of a scanning voltage when the wave form is

$$y = \frac{E}{\pi} x \text{ from } -\pi \text{ to } +\pi.$$

10. An antisymmetrical sawtooth wave has the following wave form:

$$y = \frac{2E}{\pi} x \text{ from } -\frac{\pi}{2} \text{ to } +\frac{\pi}{2}$$

$$y = 2E - \frac{2E}{\pi} x \text{ from } \frac{\pi}{2} \text{ to } \frac{3\pi}{2}$$

Determine the first harmonic term in the series.

APPENDIX

1. GREEK ALPHABET

Letters		Name	Pronunciation	Equivalent
Capital	Small			
A	α	Alpha	ăl'fă	a
B	β	Beta	bē'tă or bā'tă	b
Γ	γ	Gamma	găm'ă	g
Δ	δ	Delta	děl'tă	d
E	ε	Epsilon	ěp'sī-lǝn	e (short)
Z	ζ	Zeta	zē'tă or zā'tă	z
H	η	Eta	ē'tă or ā'tă	e (long)
Θ	θ	Theta	thē'tă or thā'tă	th
I	ι	Iota	i-ō'tă	i
K	κ	Kappa	kăp'ă	k, c
Λ	λ	Lambda	lăm'dă	l
M	μ	Mu	mū, mōō, or mŭ	m
N	ν	Nu	nū or nŭ	n
Ξ	ξ	Xi	zī or ksē	x
O	ο	Omicron	ôm'ī-krǝn or ô-mī'krǝn	o (short)
Π	π	Pi	pī or pē	p
P	ρ	Rho	rō	r
Σ	σ	Sigma	sīg'mă	s
T	τ	Tau	tô or tou	t
Υ	υ	Upsilon	ŭp'sī-lǝn	u, y
Φ	φ	Phi	fī or fē	ph
X	χ	Chi	kī, kē, or kē	kh, ch
Ψ	ψ	Psi	psē or sī	ps
Ω	ω	Omega	ô-mē'gă ô-měg'ă, or ô'mě-gă	o (long)

ăt, ăte, operă;  
nět, mē, pīn, pīne;  
nőt, ôrb, nōte, fōod, ŭp, lŭte, menŭ;  
κ-ch, in German *ack*.

2. MATHEMATICAL SYMBOLS AND ABBREVIATIONS

Symbol	Name	Uses
1, 2, 3, 4, 5, 6, 7, 8, 9, 0	Arabic numerals	The numerals used in mathematics
$\infty$	Infinity	A quantity larger than any number
.	Decimal point	A period used to point off numbers
+	Plus	Addition, positive
-	Minus	Subtraction, negative
$\pm$	Plus or minus	Addition or subtraction
$\mp$	Minus or plus	Subtraction or addition
$\times$	Multiply by	Multiplication
$a \cdot b$	$a$ is multiplied by $b$	Multiplication
$(2 \cdot 1)(3 \cdot 4)$	2·1 multiplied by 3·4	Quantity multiplication
$\div$	Divided by	Division
$a/b$	$a$ is divided by $b$	Division (fraction form), or per
$\frac{a}{b}$	$a$ is divided by $b$	Division (fraction or ratio form)
$a:b$	$a$ is to $b$	Ratio form of division
=	Equal to	Equality in equation form
$\equiv$	Identical to	Identity in equation form
$\doteq$	Approximately equal to	Approximate equality in equations (sometimes used for approaches)
$\neq$	Not equal to	Inequality in equation form
<	Less than	Inequality in equation form
>	Greater than	Inequality in equation form
$\leq$	Equal or less than	Equality or inequality in equation form
$\geq$	Equal or greater than	Equality or inequality in equation form
$\propto$	Proportional to	Proportionality used in equation form
$::$	Proportional to	Proportionality used in equation form
$\rightarrow$	Approaches	To express that a quantity approaches in equation form
$\perp$	Perpendicular	Geometry
$\parallel$	Parallel to, or in parallel with	Geometry, or parallel electrical circuits
$\angle$	Positive angle sign	Geometry, vector quantities
$\sphericalangle$	Negative angle sign	Geometry, vector quantities
$\Delta$	Triangle	Geometry
$\odot$	Circle	Geometry
$\therefore$	Therefore	Geometry
$\#$	Number	When placed before figures
%	Per cent	Placed after number expressing per cent
...	Continued	To indicate the continuation of a number or series
$\pi$	Pi	$\pi = 3.1416 \dots$ radians, the circumference of a circle divided by its diameter

Symbol	Name	Uses
$e$	Epsilon	$e = 2.71828 \dots$ , the base of natural logarithms
$3!$ or $\underline{3}$	Factorial	To express the fact that a number is multiplied by all smaller numbers, thus $3! = \underline{3} = 3 \times 2 \times 1 = 6$
$\Sigma$	Summation	To add a series of terms
$\sum_o^n$	Summation from $o$ to $n$	To add a series of terms from $o$ to $n$
$( )$	Parentheses	A sign placed at both ends of a grouping
$[ ]$	Brackets	A sign placed at both ends of a grouping
$\{ \}$	Braces	A sign placed at both ends of a grouping
$\_$	Vinculum	A line placed over a grouping
$\sqrt{\quad}$	Radical	Extract the root of a number
$\sqrt{\quad}$	Radical and vinculum	Extract the square root of a quantity or number
$\sqrt[3]{A}$ or $A^{1/3}$	3 is the root of the quantity $A$	Expressing the root to be extracted, or $1/3$ is the power to which it must be raised
$A^2$	2 is the exponent of the quantity $A$	Expressing the power to which a quantity is to be raised
$ A $	$A$ has a magnitude only	To express only the magnitude of a quantity
$A$ or $\vec{A}$ or $\bar{A}$	$A$ is a vector	To express a quantity that has both magnitude and direction
$A$	$A$ is a vector	When the magnitude is expressed $ A $ , the $A$ can be used to express a vector quantity
$A_x$	$x$ is a subscript	To identify the quantity $A$ , as, for example, lying along the $x$ -axis
$j$	Operator $j$	To express quantities in the direction of the $y$ -axis. (In pure mathematics, $i$ is used for this operator and is called an imaginary number.)
$^\circ$	Degree sign	To express angles in degrees
$'$	Minute sign	To express angles in minutes
$''$	Second sign	To express angles in seconds
$\begin{vmatrix} a & b \\ c & d \end{vmatrix}$	Determinate sign	To express the solution of simultaneous equations
$\Delta x$	Increment of $x$	Small changes, in calculus
$dx$	Differential of $x$	Differential, in calculus
$\partial x$	Partial differential of $x$	Partial differential, in calculus
$\nabla$	Del	Differential operator, in differential calculus

Symbol	Name	Uses
$\int$	Integral	Integral calculus
$\int_b^a$	Integral between the limits of $a$ and $b$	Integration between limits
$F(x)$ or $f(x)$	Function of $x$	Algebra or calculus
$J_n(x)$	Bessel function of the first kind of order $n$	Higher mathematics—Frequency modulation
$K_n(x)$	Bessel function of second kind of order $n$	Higher mathematics
$\Gamma$	Gamma function	Higher mathematics
Abbreviation	Name	Uses
$\ln, \log$	Logarithm	Express the natural and common logarithm of a quantity, respectively
$\log$ or $\log_{10}$	Logarithm to base 10	This is the common base and is usually written $\log$
$\ln$ or $\log_e$	Logarithm to base $e$	This is the natural base and is usually expressed $\ln$ (sometimes called "Napierian")
$\operatorname{colog}$	Cologarithm	The logarithm of the reciprocal of a number
$\operatorname{antilog}$	Antilogarithm	To express a number in terms of its logarithm (the reverse operation of taking the logarithm of a number)
$\sin$	Sine of	Circular trigonometry
$\sin^{-1}$	Arc whose sine is	Antisine of, inverse of sine (circular trigonometry)
$\sinh$	Hyperbolic sine of	Hyperbolic trigonometry
$\sinh^{-1}$	Inverse hyperbolic sine of	Hyperbolic trigonometry
$\cos$	Cosine of	Circular trigonometry
$\cos^{-1}$	Arc whose cosine is	Anticosine of, inverse cosine of (circular trigonometry)
$\cosh$	Hyperbolic cosine of	Hyperbolic trigonometry
$\cosh^{-1}$	Inverse hyperbolic cosine of	Hyperbolic trigonometry
$\tan$	Tangent of	Circular trigonometry
$\tan^{-1}$	Arc whose tangent is	Antitangent of, inverse of tangent (circular trigonometry)
$\tanh$	Hyperbolic tangent of	Hyperbolic trigonometry

Abbrevia- tion	Name	Uses
$\tanh^{-1}$	Inverse hyperbolic tangent of	Hyperbolic trigonometry
$\cot$	Cotangent of	Circular trigonometry
$\cot^{-1}$	Arc whose tangent is	Anticotangent of, inverse of cotangent (circular trigonometry)
$\coth$	Hyperbolic cotangent of	Hyperbolic trigonometry
$\coth^{-1}$	Inverse hyperbolic cotangent of	Hyperbolic trigonometry
$\csc$	Cosecant of	Circular trigonometry
$\csc^{-1}$	Arc whose cosecant is	Anticosecant of, inverse of cosecant (circular trigonometry)
$\csch$	Hyperbolic cosecant of	Hyperbolic trigonometry
$\csch^{-1}$	Inverse hyperbolic cosecant of	Hyperbolic trigonometry
$\sec$	Secant of	Circular trigonometry
$\sec^{-1}$	Arc whose secant is	Antisecant of, inverse of secant (circular trigonometry)
$\sech$	Hyperbolic secant of	Hyperbolic trigonometry
$\sech^{-1}$	Inverse hyperbolic secant of	Hyperbolic trigonometry
$\text{vers}$	Versed sine	$\text{vers } \beta = 1 - \cos \beta$ (circular trigonometry)
$\text{covers}$	Covered sine	$\text{covers } \beta = 1 - \sin \beta$ (circular trigonometry)
$\text{hyp}$	hypotenuse	Trigonometry
$\text{opp}$	opposite side	Trigonometry
$\text{adj}$	adjacent side	Trigonometry
L.C.D.	least common denominator	Algebra

### 3. ENGINEERING SYMBOLS AND ABBREVIATIONS

#### a. Greek alphabet symbols:

- $\alpha$  Angles, attenuation factor, radiation
- $\beta$  Angles, wave length constant, radiation
- $\Gamma$  Complex Hertzian vector
- $\gamma$  Angles, propagation constant, conductivity, radiation, Euler's constant
- $\Delta$  Increments, variation
- $\delta$  Decrement, density
- $\epsilon$  Base natural logarithms, very small quantity, inductivity, permittivity
- $\eta$  Efficiency, elliptic coordinate

- $\Theta$  Angles, temperature
- $\theta$  Angles, elevation angle, time constant, phase displacement
- $\kappa$  Boltzmann's constant, dielectric constant
- $\Lambda, \lambda$  Wave length of electric waves
- $\mu$  Amplification factor, permeability, prefix micro
- $\nu$  Frequency of radiation
- $\xi$  Elliptic coordinate
- $\Pi$  Hertz vector
- $\pi$  Circumference of a circle divided by its diameter
- $\rho$  Resistivity, specific resistivity, charge density
- $\Sigma$  Summation
- $\sigma$  Conductivity
- $\tau$  angles, tangent vector, surface density
- $\Phi$  Scalar velocity potential, magnetic flux
- $\phi$  Angles, flux, power factor angle, true azimuth, electric potential
- $\chi$  Magnetic susceptibilities
- $\Psi$  Angles, phase difference, scalar function
- $\Omega$  Resistance in ohms
- $\omega$  Resistance in ohms, angular velocity
- b. English alphabet symbols:**
  - A** Area, current electromagnetic vector potential
  - a** Dimensions, amperes
  - B** Susceptance, magnetic inductance, magnetic flux density
  - b** Susceptance
  - C** Capacity, centigrade
  - c** Constant, velocity of light
  - D** Electric displacement, electrostatic flux density
  - d** Distance, diameter
  - E** Effective voltage, emf, electric field intensity
  - e** Instantaneous voltage
  - F** Force, electrostatic field intensity
  - f** Frequency, force, farad
  - G** Conductance measured in mho
  - g** Conductance, acceleration due to gravity, gram
  - H** Magnetic field intensity
  - h** Height, Plank's constant, henry
  - I** Effective current
  - i** Instantaneous current
  - J** Poynting's vector, current density vector, intensity of magnetization
  - j** Operator
  - K** Constant, dielectric constant, stacking factor
  - k** Susceptibility, prefix "kilo-"
  - L** Self inductance
  - l** Length
  - M** Mutual inductance, meters, induced polarization, prefix "mega-"
  - m** Mass, prefix "milli-"
  - N** Number of conductors or turns, Avogadro's number
  - n** Number, velocity of rotation

<i>O</i>	Origin of coordinate system
<i>o</i>	Origin of coordinate system
<i>P</i>	Power
<i>p</i>	Sound pressure, instantaneous power
<i>Q</i>	Quantity of electricity, ratio of reactance to resistance
<i>q</i>	Electric charge
<i>R</i>	Resistance, reluctance
<i>r</i>	Resistance, radius
<i>S</i>	Sensitivity, surface area
<i>s</i>	Transconductance
<i>T</i>	Absolute temperature, periodic time, absolute temperature, tension
<i>t</i>	Time
<i>U</i>	Energy
<i>u</i>	Particle velocity
<i>V</i>	Voltage, volume, reluctivity
<i>v</i>	Velocity
<i>W</i>	Energy
<i>w</i>	Watts
<i>X</i>	Coordinates, reactance
<i>x</i>	Coordinates, reactance
<i>Y</i>	Coordinates, admittance
<i>y</i>	Coordinates, admittance
<i>Z</i>	Coordinates, impedance
<i>z</i>	Coordinates, impedance

**c. Quantitative electrical abbreviations:**

**Capacitance**

$\mu\mu\text{f}$	Micromicrofarad (one-millionth of a millionth part of a farad)
$\mu\text{f}$	Microfarad (one-millionth of a farad) NOTE: In some cases, mfd or mf are used instead of $\mu\text{f}$ to indicate one millionth of a farad. It is always safe to assume that mfd or mf means microfarad and not millifarads.
<i>f</i>	Farad NOTE: The letter <i>f</i> is rarely used alone. It is preferable to spell the word out when it is used.

**Current**

$\mu\text{a}$	Microampere (one-millionth of an ampere)
<i>ma</i>	Milliampere (one-thousandth of an ampere)
<i>a</i> or <i>amp</i>	Ampere

**Frequency**

<i>cps</i>	Cycles per second
<i>kc</i>	Kilocycles per second
<i>Mc</i>	Megacycles per second

**Inductance**

$\mu\text{h}$	Microhenry (one-millionth of a henry)
<i>mh</i>	Millihenry (one-thousandth of a henry)
<i>h</i>	Henry

## Power

$\mu\text{w}$	Microwatt (one-millionth of a watt)
$\text{mw}$	Milliwatt (one-thousandth of a watt)
$\text{w}$	Watt
$\text{kw}$	Kilowatt (one thousand watts)
$\text{Mw}$	Megawatt (one million watts)
$\text{kva}$	Kilovolt ampere—apparent power
$\text{kwhr}$	Kilowatt hour

## Resistance

$\Omega$	Ohms NOTE: In some cases $\omega$ is used to express ohms.
$\text{k}\Omega$	Kilohm (one thousand ohms)
$\text{M}\Omega$	Megohm (one million ohms) NOTE: In some cases Meg is used to express megohms.

## Voltage

$\mu\text{v}$	Microvolt (one-millionth of a volt)
$\text{mv}$	Millivolt (one-thousandth of a volt)
$\text{v}$	Volt
$\text{kv}$	Kilovolt (one thousand volts)

*d. Circuit Symbols:*

## Admittance

$Y$	Admittance in mhos
$B$	Susceptance in mhos
$B_C$	Capacitive susceptance in mhos
$B_L$	Inductive susceptance in mhos

## Constants

$G$	Conductance in mhos
$C$	Capacitance in farads
$L$	Inductance in henrys
$M$	Mutual inductance in henrys
$R$	Resistance in ohms
$G$	Conductance in mhos

## Current

$I$	Effective (or rms) current in amperes
$I_m$	Maximum (or peak) current in amperes <sup>1</sup>
$I_{av}$	Average current in amperes <sup>2</sup>
$i$	Instantaneous current in amperes

## Impedance

$Z$	Impedance in ohms
$X$	Reactance in ohms
$X_C$	Capacitive reactance in ohms
$X_L$	Inductive reactance in ohms
$R$	Resistance in ohms

## Miscellaneous

$\text{Ant}$	Antenna
$\text{Gnd}$	Ground
$\text{Mod}$	Modulator
$\text{Spkr}$	Loud speaker

<sup>1 2</sup> See footnotes on page 241.

## Power supply

- A* Filament power supply
- B* Plate power supply
- C* Grid-bias power supply

## Tube

- Fil* Filament
- K* or *k* Cathode
- H* or *h* Heater
- G* or *g* Grid
- S<sub>g</sub>* Screen grid
- P* or *p* Plate

## Voltage

- E* Effective (or rms) voltage in volts
- E<sub>m</sub>* Maximum (or peak) voltage in volts<sup>1</sup>
- E<sub>av</sub>* Average voltage in volts<sup>2</sup>
- e* Instantaneous voltage in volts

e. Abbreviations:<sup>3</sup>

## Current

- ac* Alternating current
- dc* Direct current

## Frequency

- af* Audio frequency
- if* Intermediate frequency
- rf* Radio frequency
- trf* Tuned radio frequency
- bf* Beat frequency
- bfo* Beat-frequency oscillator
- lf* Low-frequency (30 to 300 kc band)
- mf* Medium-frequency (300 to 3,000 kc band)
- hf* High-frequency (3,000 kc to 30 Mc band)
- vhf* Very-high-frequency (30 to 300 Mc band)
- uhf* Ultra-high-frequency (300 to 3,000 Mc band)

## Miscellaneous

- cw* Continuous wave
- icw* Interrupted continuous wave
- am* Amplitude modulation
- fm* Frequency modulation

<sup>1</sup> In some cases the subscript "max" is used to indicate maximum or peak current or voltage. For example, when the subscript "min" is used to indicate minimum current or voltage, the subscript "max" will probably be used for maximum current or voltage.

<sup>2</sup> In some cases the subscript "avg" is used to express average current or voltage.

<sup>3</sup> The abbreviations as given here are used as nouns. When they are used as adjectives, it is common practice to use a hyphen, thus

*ac* Alternating current (noun)

*a-c* alternating-current (adjective)

pm	Phase modulation
ptm	Pulse time modulation
emf	Electromotive force in volts
mmf	Magnetomotive force in gilberts
avc	Automatic volume control
davc	Delayed automatic volume control
mopa	Master-oscillator power-amplifier

**f. Measurement abbreviations:**

## Metric prefixes

$\mu$	Micro- (one-millionth)
m	Milli- (one-thousandth)
c	Centi- (one-hundredth)
d	Deci- (one-tenth)
	Uni- (one) NOTE: This prefix is usually omitted.
dk	Deka- (ten)
h	Hekto- (one hundred)
k	Kilo- (one thousand)
M	Mega- (one million)

## Metric measure

mm	Millimeter (one-thousandth of a meter)
cm	Centimeter (one-hundredth of a meter)
km	Kilometer (one thousand meters)
sq cm	Square centimeter or $\text{cm}^2$
sq m	Square meter or $\text{m}^2$
sq km	Square kilometer or $\text{km}^2$
cu m	Cubic meter or $\text{m}^3$
cgs	Centimeter-gram-second system of units
mks	Meter-kilogram-second system of units

## English measure

in.	Inch
ft	Foot
yd	Yard
mile	Mile NOTE: This unit is always spelled out.
sq in	Square inch
sq ft	Square foot
cu in	Cubic inch
cu ft	Cubic foot
sec	Second
min	Minute
hr	Hour
yr	Year
lb	Pound
rps	Revolutions per second
rpm	Revolutions per minute
mph	Miles per hour

**g Miscellaneous abbreviations:**

A.W.G. or B.&S. American wire gauge or Brown and Sharpe wire gauge. NOTE: These gauges are commonly used for copper, aluminum, and resistance wire.

db	Decibel
deg	Degree
diam	Diameter
dcc	Double cotton covered
dsc	Double silk covered
ec	Enamel covered
mlt	Mean length of turn
p., pp.	Page, pages
rms	Root mean square
rss	Root sum square
temp	Temperature
vol	Volume
vs.	Versus
wt	Weight

## 4. CONVERSION TABLE

<div> <div> Multiply number of by to obtain </div> <div> </div> </div>	$\mu\mu$ units micro- micro units	$\mu$ units micro units	m units milli units	units	k units kilo units	M units mega units

40	0.6428	0.7660	0.8391	1.1918
50	0.7660	0.6428	1.1918	0.8391
60	0.8660	0.5000	1.7321	0.5774
70	0.9397	0.3420	2.7475	0.3640
80	0.9848	0.1736	5.6713	0.1763
90	1.0000	0.0000	∞	0.0000

7. TABLE OF NATURAL LOGARITHMS\*

These four pages give the natural logarithms of numbers between 0.1 and 10, correct to four places. Moving the decimal point  $n$  places to the right in the number, i.e., multiplying the number by  $10^n$ , requires the addition of  $n$  times 2.3026 to the logarithm; values are given in the accompanying tables. Since the numbers in the first two pages are less than 1, the logarithms are all *negative* and should be preceded by a minus sign. The base is  $e = 2.71828$ .

$\log_e x = \log_e 10 \log_{10} x = 2.3026 \log_{10} x$   
 $\log_{10} x = \log_{10} e \log_e x = 0.4343 \log_e x$

$n$	$(n \cdot 2.3026)$	$n(0.6974-3)$

## 14. ALGEBRAIC FORMULAS

### a. Miscellaneous Formulas:

$$(1) \quad a + b = b + a$$

$$(2) \quad (a + b) + c = a + (b + c)$$

$$(3) \quad a + c = b + d, \text{ if } a = b \text{ and } c = d$$

$$(4) \quad ab = ba$$

$$(5) \quad (ab)c = a(bc)$$

$$(6) \quad a(b + c) = ab + ac$$

$$(7) \quad ac = bd, \text{ if } a = b \text{ and } c = d$$

$$(8) \quad a + (-b) = a - b$$

$$(9) \quad a - (-b) = a + b$$

$$(10) \quad 0 \cdot a = 0$$

$$(11) \quad \frac{0}{a} = 0$$

$$(12) \quad \infty \cdot a = \infty$$

$$(13) \quad \frac{\infty}{a} = \infty$$

$$(14) \quad 0 \cdot \infty = \text{indeterminate}$$

$$(15) \quad \frac{0}{0} = \text{indeterminate}$$

$$(16) \quad \frac{\infty}{\infty} = \text{indeterminate}$$

$$(17) \quad a(-b) = -ab$$

$$(18) \quad (-a)(-b) = ab$$

$$(19) \quad -(a - b + c) = -a + b - c$$

$$(20) \quad \frac{a}{b} = \frac{ac}{bc}$$

$$(21) \quad \frac{-a}{b} = \frac{a}{-b} = -\frac{a}{b}$$

$$(22) \quad \frac{a}{c} + \frac{b}{c} = \frac{a + b}{c}$$

$$(23) \frac{a}{c} - \frac{b}{c} = \frac{a-b}{c}$$

$$(24) \frac{a}{b} + \frac{c}{d} = \frac{ad+bc}{bd}$$

$$(25) \left(\frac{a}{b}\right)\left(\frac{c}{d}\right) = \frac{ac}{bd}$$

$$(26) \frac{\frac{a}{b}}{\frac{c}{d}} = \left(\frac{a}{b}\right)\left(\frac{d}{c}\right) = \frac{ad}{bc}$$

$$(27) (a^m)(a^n) = a^{m+n}$$

$$(28) (a^m)^n = a^{mn}$$

$$(29) (abc)^m = a^m b^m c^m$$

$$(30) \left(\frac{a}{b}\right)^m = \frac{a^m}{b^m}$$

$$(31) \frac{a^m}{a^n} = a^{m-n} = \frac{1}{a^{n-m}}$$

$$(32) a^0 = 1$$

$$(33) a^{\frac{m}{n}} = \sqrt[n]{a^m}$$

$$(34) a^{-m} = \frac{1}{a^m}$$

$$(35) (a+b)(a+b) = a^2 + 2ab + b^2$$

$$(36) (a+b)(a-b) = a^2 - b^2$$

$$(37) (a-b)(a-b) = a^2 - 2ab + b^2$$

$$(38) (a+b)(c-d) = ac + bc - ad - bd$$

$$(39) \text{ Factorial number } n! = \underline{n} = 1 \cdot 2 \cdot 3 \cdot \dots \cdot (n-1)n$$

**b. Simultaneous equations:**

1. The solution of the two simultaneous equations

$$a_1x + b_1y = c_1$$

$$a_2x + b_2y = c_2$$

by determinants is

$$x = \frac{\begin{vmatrix} c_1 & b_1 \\ c_2 & b_2 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}}$$

$$y = \frac{\begin{vmatrix} a_1 & c_1 \\ a_2 & c_2 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 \\ a_2 & b_2 \end{vmatrix}}$$

2. The solution of three simultaneous equations

$$a_1x + b_1y + c_1z = d_1$$

$$a_2x + b_2y + c_2z = d_2$$

$$a_3x + b_3y + c_3z = d_3$$

by determinants is

$$x = \frac{\begin{vmatrix} d_1 & b_1 & c_1 \\ d_2 & b_2 & c_2 \\ d_3 & b_3 & c_3 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}}$$

$$y = \frac{\begin{vmatrix} a_1 & d_1 & c_1 \\ a_2 & d_2 & c_2 \\ a_3 & d_3 & c_3 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}}$$

$$z = \frac{\begin{vmatrix} a_1 & b_1 & d_1 \\ a_2 & b_2 & d_2 \\ a_3 & b_3 & d_3 \end{vmatrix}}{\begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}}$$

**c. Quadratic equations:**

For the quadratic equation

$$ax^2 + bx + c = 0$$

the solution by the quadratic formula is

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

If the discriminant  $b^2 - 4ac$  is positive, zero, or negative, the roots are accordingly real and unequal, real and equal, or unequal and complex numbers.

**d. Binomial theorem** ( $n$  being a positive integer):

$$(a \pm b)^n = a^n \pm na^{n-1}b + \frac{n(n-1)}{2} a^{n-2}b^2 \pm \frac{n(n-1)(n-2)}{3} a^{n-3}b^3 + \dots$$

**e. Trapezoidal rule:**

$$A = \Delta x \left[ \frac{1}{2}(y_0 + y_n) + \sum_{k=1}^{n-1} y_k \right]$$

where  $A$  = area

$\Delta x$  = width of strips

$y_k$  = height of  $k$ th strip

$n$  = number of strips

**f. Simpson's rule:**

$$A = \frac{\Delta x}{3} \left[ (y_0 + y_n) + 4 \sum_{k=1}^{\frac{n}{2}-1} y_{2k-1} + 2 \sum_{k=1}^{\frac{n}{2}-1} y_{2k} \right]$$

where the letters have the same meaning as given above in the trapezoidal rule.

## APPENDIX

## 15. LOGARITHMIC FORMULAS

- (1)  $\ln$  = natural logarithm to base  $e$
- (2)  $\log$  = common logarithm to base 10
- (3)  $\log 1 = 0$        $\ln 1 = 0$
- (4)  $\log 10 = 1$        $\ln e = 1$
- (5)  $\log ab = \log a + \log b$        $\ln ab = \ln a + \ln b$
- (6)  $\log a^n = n \log a$        $\ln a^n = n \ln a$
- (7)  $\log a^{\frac{1}{n}} = \frac{1}{n} \log a$        $\ln a^{\frac{1}{n}} = \frac{1}{n} \ln a$
- (8) If  $y = \log x$       If  $y = \ln x$   
 $10^y = x$        $e^y = x$
- (9)  $\log x = \log e \ln x = 0.4343 \ln x$
- (10)  $\ln x = \ln 10 \log x = 2.3026 \log x$
- (11) The characteristic of a number is the whole number part of the common logarithm and is the exponent of 10 when the number is written in scientific notation.
- (12) The mantissa of a number is the decimal part of the common logarithm found in the tables.
- (13) Example of characteristic and mantissa

$$\log (3.1623)10^2 = 2.500$$

where 2 = the characteristic, from exponent of 10

0.5 = the mantissa, from logarithm tables

Thus

$$316.23 = 10^{2.5}$$

## 16. COMPLEX QUANTITIES

- (1)  $j = \sqrt{-1}$       or       $j^2 = -1$
  - (2)  $a + jb = \sqrt{a^2 + b^2} (\cos \alpha + j \sin \alpha)$   
 $= C e^{j\alpha} = C/\alpha$
- where  $C = \sqrt{a^2 + b^2}$   
 $\tan \alpha = \frac{b}{a} = \frac{\sin \alpha}{\cos \alpha}$
- (3)  $(a + jb) + (c + jd) = (a + c) + j(b + d)$
  - (4)  $(a + jb) - (c + jd) = (a - c) + j(b - d)$
  - (5)  $(a + jb)(c + jd) = (ac - bd) + j(bc + ad)$
  - (6)  $(a + jb)(c - jd) = (ac + bd) + j(bc - ad)$
  - (7)  $\frac{a + jb}{c + jd} = \frac{a + jb}{c + jd} \cdot \frac{c - jd}{c - jd} = \frac{ac + bd}{c^2 + d^2} + j \frac{bc - ad}{c^2 + d^2}$
  - (8)  $\frac{a + jb}{c + jd} = \frac{C e^{j\alpha}}{E e^{j\beta}} = \frac{C}{E} e^{j(\alpha - \beta)} = \frac{C}{E} \cos (\alpha - \beta) + j \frac{C}{E} \sin (\alpha - \beta)$

where  $C = \sqrt{a^2 + b^2}$ ;  $\tan \alpha = \frac{b}{a}$

$$E = \sqrt{c^2 + d^2}; \tan \beta = \frac{d}{c}$$

- (9) If  $a + jb = c + jd$

then       $a = c$

and       $b = d$

17. TRIGONOMETRIC CHARTS AND FORMULAS

a. Chart of fraction values for trigonometric functions :

Degrees	Sine	Cosine	Tangent	Cotangent
0	0	1	0	$\infty$
30	$\frac{1}{2}$	$\frac{1}{2} \sqrt{3}$	$\frac{1}{\sqrt{3}}$	$\sqrt{3}$
45	$\frac{1}{2} \sqrt{2}$	$\frac{1}{2} \sqrt{2}$	1	1
60	$\frac{1}{2} \sqrt{3}$	$\frac{1}{2}$	$\sqrt{3}$	$\frac{1}{\sqrt{3}}$
90	1	0	$\infty$	0
120	$\frac{1}{2} \sqrt{3}$	$-\frac{1}{2}$	$-\sqrt{3}$	$-\frac{1}{\sqrt{3}}$
135	$\frac{1}{2} \sqrt{2}$	$-\frac{1}{2} \sqrt{2}$	-1	-1
150	$\frac{1}{2}$	$-\frac{1}{2} \sqrt{3}$	$-\frac{1}{\sqrt{3}}$	$-\sqrt{3}$
180	0	-1	0	$\infty$

b. Chart for reducing angles :

Angle	Sine	Cosine	Tangent	Cotangent
$\pm \alpha$	$\pm \sin \alpha$	$\pm \cos \alpha$	$\pm \tan \alpha$	$\pm \cot \alpha$
$90^\circ \pm \alpha$	$\mp \cos \alpha$	$\mp \sin \alpha$	$\mp \cot \alpha$	$\mp \tan \alpha$
$180^\circ \pm \alpha$	$\mp \sin \alpha$	$-\cos \alpha$	$\pm \tan \alpha$	$\pm \cot \alpha$
$270^\circ \pm \alpha$	$-\cos \alpha$	$\pm \sin \alpha$	$\mp \cot \alpha$	$\mp \tan \alpha$
$360^\circ \pm \alpha$	$\pm \sin \alpha$	$\pm \cos \alpha$	$\pm \tan \alpha$	$\pm \cot \alpha$

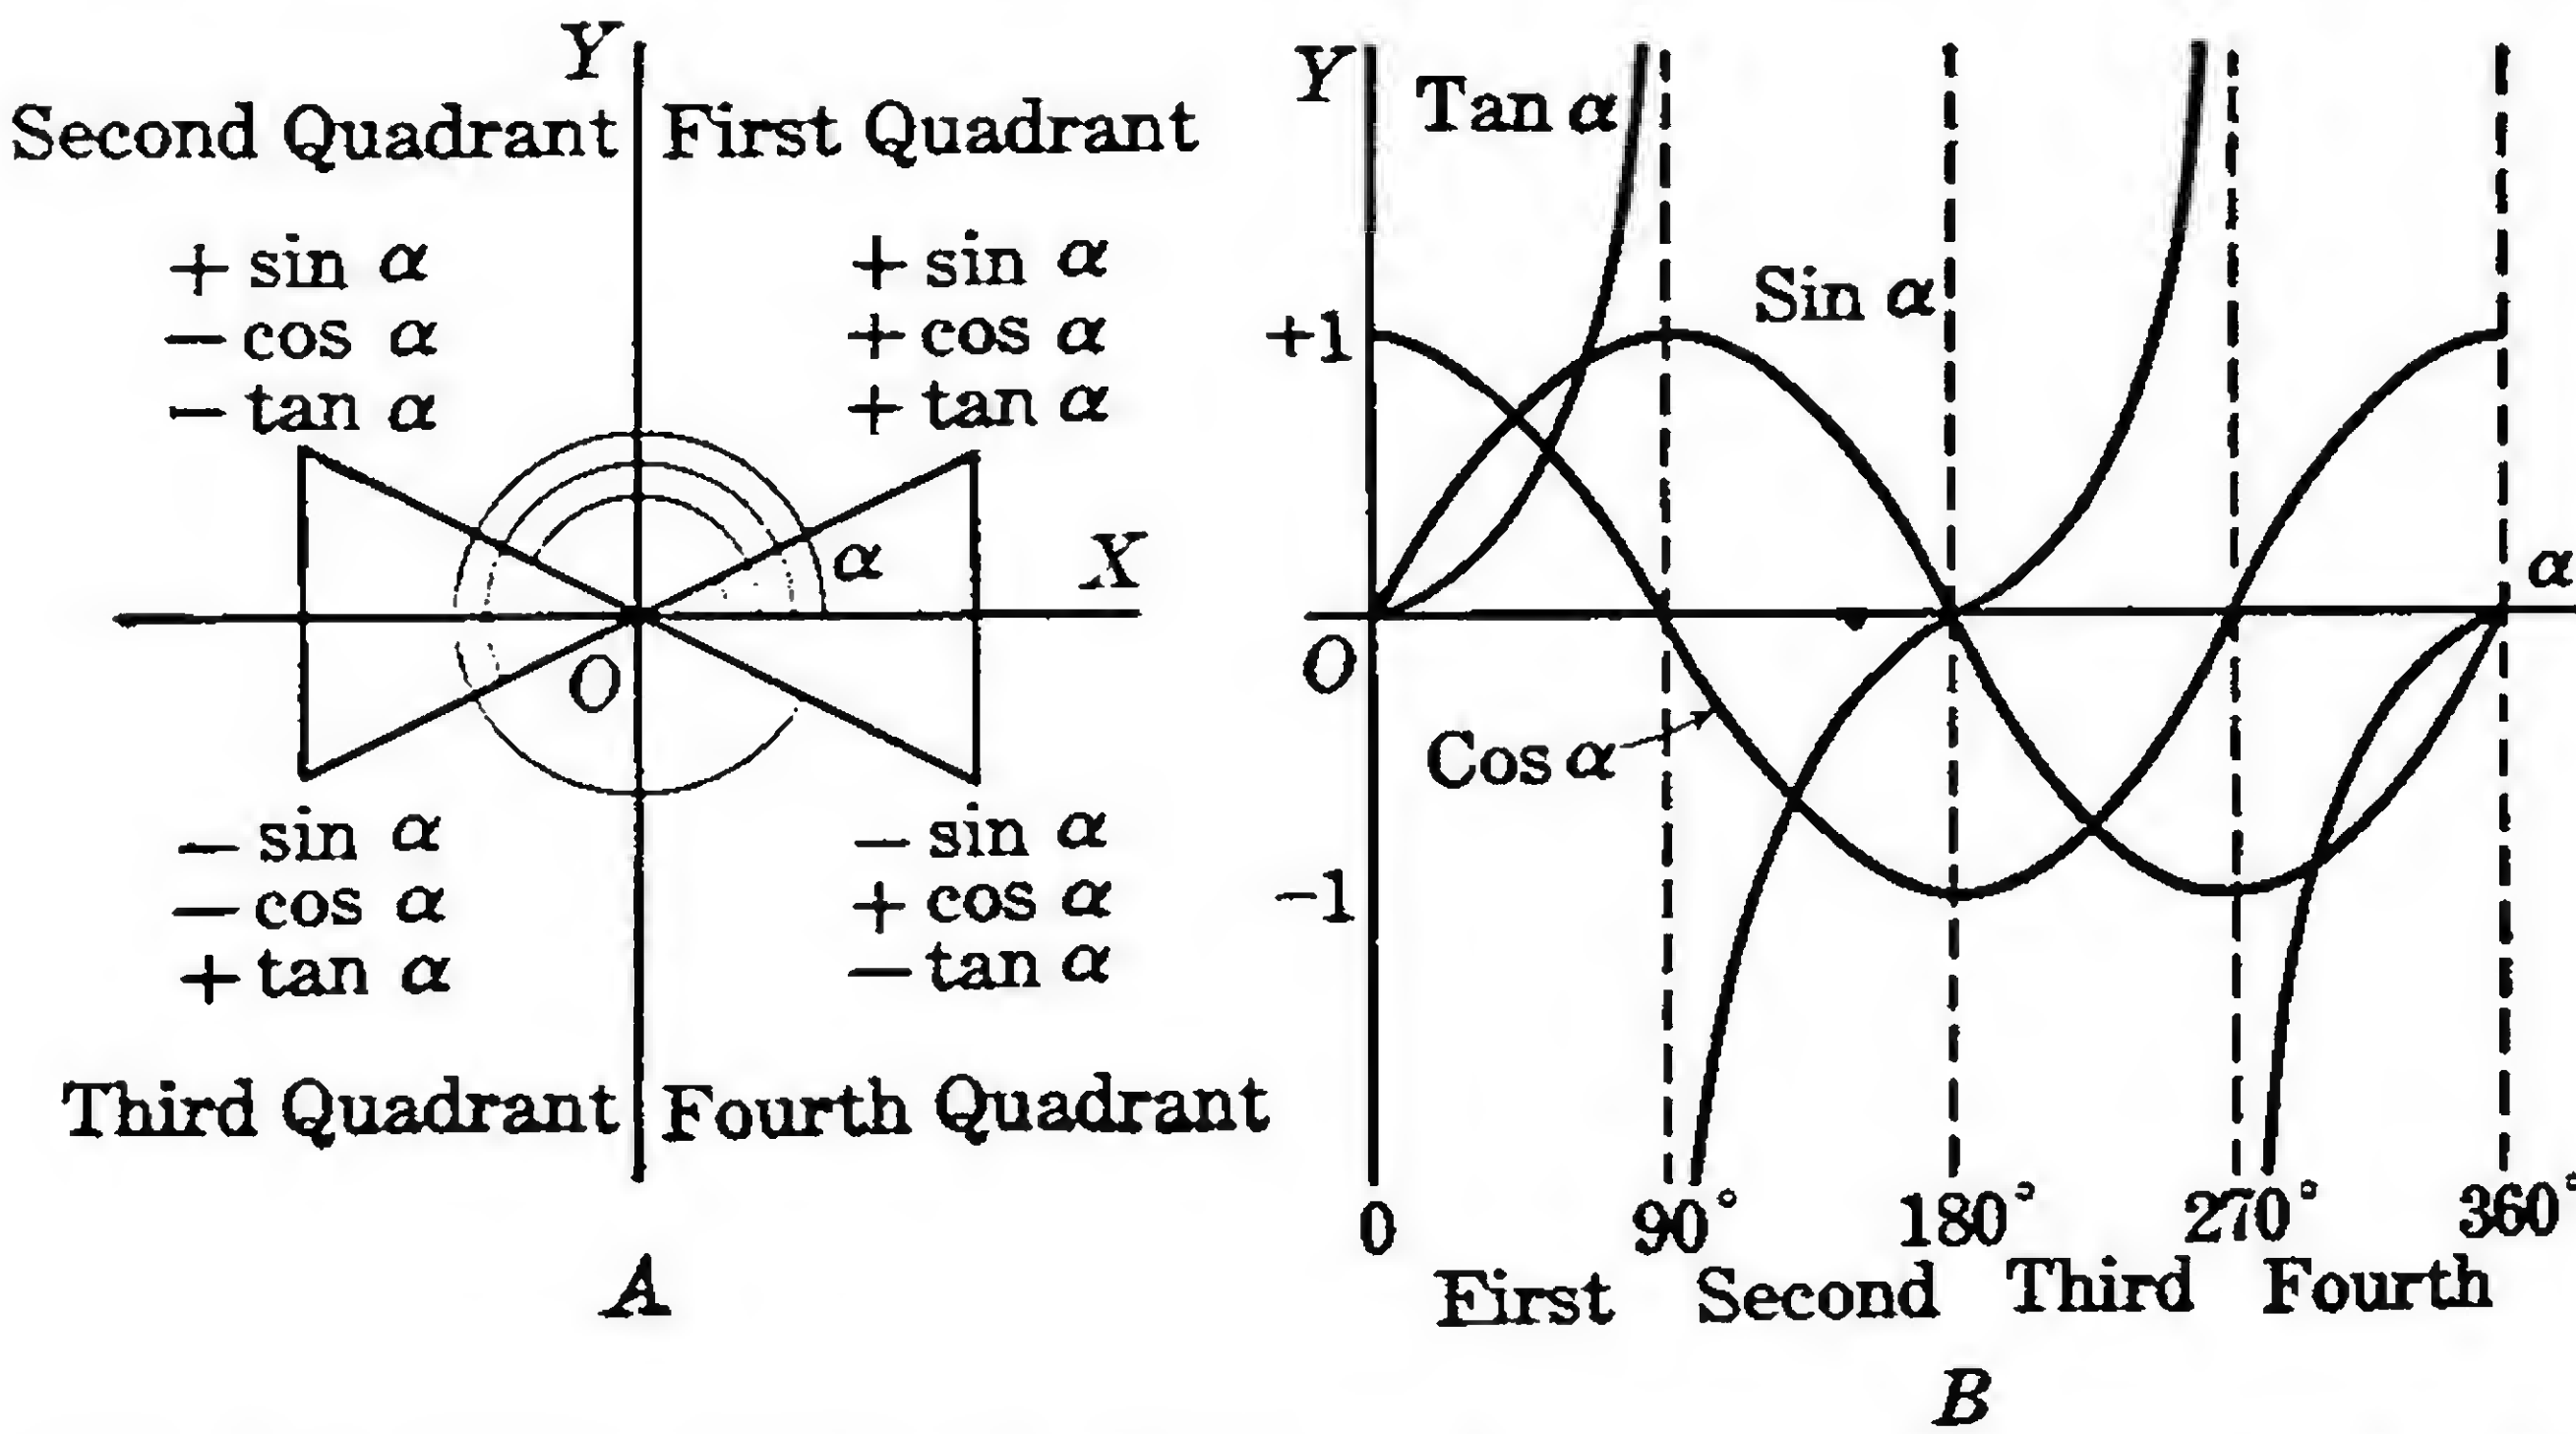

FIG. 98.—Algebraic signs and graphs of trigonometric functions in the various quadrants.

c. Trigonometric functions in terms of each other:

Sine	Cosine	Tangent	Cotangent	Secant	Cosecant
$\sin \alpha$	$\sqrt{1 - \cos^2 \alpha}$	$\frac{\tan \alpha}{\sqrt{1 + \tan^2 \alpha}}$	$\frac{1}{\sqrt{1 + \cot^2 \alpha}}$	$\frac{\sqrt{\sec^2 \alpha - 1}}{\sec \alpha}$	$\frac{1}{\csc \alpha}$
$\sqrt{1 - \sin^2 \alpha}$	$\cos \alpha$	$\frac{1}{\sqrt{1 + \tan^2 \alpha}}$	$\frac{\cot \alpha}{\sqrt{1 + \cot^2 \alpha}}$	$\frac{1}{\sec \alpha}$	$\frac{\sqrt{\csc^2 \alpha - 1}}{\csc \alpha}$
$\frac{\sin \alpha}{\sqrt{1 - \sin^2 \alpha}}$	$\frac{\sqrt{1 - \cos^2 \alpha}}{\cos \alpha}$	$\tan \alpha$	$\frac{1}{\cot \alpha}$	$\sqrt{\sec^2 \alpha - 1}$	$\frac{1}{\sqrt{\csc^2 \alpha - 1}}$
$\frac{\sqrt{1 - \sin^2 \alpha}}{\sin \alpha}$	$\frac{\cos \alpha}{\sqrt{1 - \cos^2 \alpha}}$	$\frac{1}{\tan \alpha}$	$\cot \alpha$	$\frac{1}{\sqrt{\sec^2 \alpha - 1}}$	$\sqrt{\csc^2 \alpha - 1}$
$\frac{1}{\sqrt{1 - \sin^2 \alpha}}$	$\frac{1}{\cos \alpha}$	$\sqrt{1 + \tan^2 \alpha}$	$\frac{\sqrt{1 + \cot^2 \alpha}}{\cot \alpha}$	$\sec \alpha$	$\frac{\csc \alpha}{\sqrt{\csc^2 \alpha - 1}}$
$\frac{1}{\sin \alpha}$	$\frac{1}{\sqrt{1 - \cos^2 \alpha}}$	$\frac{\sqrt{1 + \tan^2 \alpha}}{\tan \alpha}$	$\sqrt{1 + \cot^2 \alpha}$	$\frac{\sec \alpha}{\sqrt{\sec^2 \alpha - 1}}$	$\csc \alpha$

**d. Trigonometric formulas:**

$$(1) \sin \alpha = \frac{b}{c} = \cos \beta$$

$$(2) \cos \alpha = \frac{a}{c} = \sin \beta$$

$$(3) \tan \alpha = \frac{b}{a} = \cot \beta$$

$$(4) \tan \alpha = \frac{\sin \alpha}{\cos \alpha} = \frac{\cos \beta}{\sin \beta}$$

$$(5) \sin \alpha = \frac{e^{j\alpha} - e^{-j\alpha}}{2j}$$

$$(6) \cos \alpha = \frac{e^{j\alpha} + e^{-j\alpha}}{2}$$

$$(7) \tan \alpha = -j \frac{e^{j\alpha} - e^{-j\alpha}}{e^{j\alpha} + e^{-j\alpha}}$$

$$(8) \sin(-\alpha) = -\sin \alpha$$

$$(9) \cos(-\alpha) = \cos \alpha$$

$$(10) \tan(-\alpha) = -\tan \alpha$$

$$(11) \sin\left(\frac{\pi}{2} \pm \alpha\right) = \cos \alpha$$

$$(12) \cos\left(\frac{\pi}{2} \pm \alpha\right) = \mp \sin \alpha$$

$$(13) \tan\left(\frac{\pi}{2} + \alpha\right) = \mp \cot \alpha$$

$$(14) \sin(\pi \pm \alpha) = \mp \sin \alpha$$

$$(15) \cos(\pi \pm \alpha) = -\cos \alpha$$

$$(26) \cos^2 \alpha = \frac{1 + \cos 2\alpha}{2}$$

$$(27) \sin^2 \alpha + \cos^2 \alpha = 1$$

$$(28) \sin^3 \alpha = \frac{3 \sin \alpha - \sin 3\alpha}{4}$$

$$(29) \cos^3 \alpha = \frac{3 \cos \alpha + \cos 3\alpha}{4}$$

$$(30) \sin(\alpha + \beta) = \sin \alpha \cos \beta + \cos \alpha \sin \beta$$

$$(31) \sin(\alpha - \beta) = \sin \alpha \cos \beta - \cos \alpha \sin \beta$$

$$(32) \cos(\alpha + \beta) = \cos \alpha \cos \beta - \sin \alpha \sin \beta$$

$$(33) \cos(\alpha - \beta) = \cos \alpha \cos \beta + \sin \alpha \sin \beta$$

$$(34) \tan(\alpha + \beta) = \frac{\tan \alpha + \tan \beta}{1 - \tan \alpha \tan \beta}$$

$$(35) \tan(\alpha - \beta) = \frac{\tan \alpha - \tan \beta}{1 + \tan \alpha \tan \beta}$$

$$(36) \sin(\alpha + \beta) + \sin(\alpha - \beta) = 2 \sin \alpha \cos \beta$$

$$(37) \sin(\alpha + \beta) - \sin(\alpha - \beta) = 2 \cos \alpha \sin \beta$$

$$(38) \cos(\alpha + \beta) + \cos(\alpha - \beta) = 2 \cos \alpha \cos \beta$$

$$(39) \cos(\alpha - \beta) - \cos(\alpha + \beta) = 2 \sin \alpha \sin \beta$$

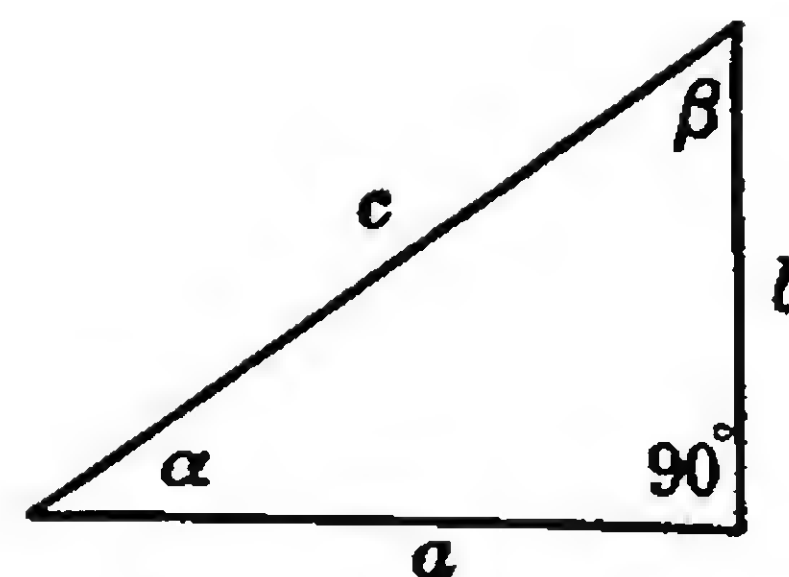

FIG. 99.—Right triangle for use with trigonometric formulas.

$$(16) \tan(\pi \pm \alpha) = \mp \tan \alpha$$

$$(17) \sin \frac{\alpha}{2} = \sqrt{\frac{1}{2}(1 - \cos \alpha)}$$

$$(18) \cos \frac{\alpha}{2} = \sqrt{\frac{1}{2}(1 + \cos \alpha)}$$

$$(19) \tan \frac{\alpha}{2} = \frac{1 - \cos \alpha}{\sin \alpha} = \frac{\sin \alpha}{1 + \cos \alpha}$$

$$(20) \sin 2\alpha = 2 \sin \alpha \cos \alpha$$

$$(21) \cos 2\alpha = 1 - 2 \sin^2 \alpha = 2 \cos^2 \alpha - 1$$

$$(22) \tan 2\alpha = \frac{2 \tan \alpha}{1 - \tan^2 \alpha}$$

$$(23) \sin 3\alpha = 3 \sin \alpha - 4 \sin^3 \alpha$$

$$(24) \cos 3\alpha = 4 \cos^3 \alpha - 3 \cos \alpha$$

$$(25) \sin^2 \alpha = \frac{1 - \cos 2\alpha}{2}$$

## 18. EXPONENTIAL AND HYPERBOLIC FORMULAS

**a. Exponential formulas:**

- (1)  $e^{j\beta} = \cos \beta + j \sin \beta$
- (2)  $e^{-j\beta} = \cos \beta - j \sin \beta$
- (3)  $e^{\alpha} = \cosh \alpha + \sinh \alpha$
- (4)  $e^{-\alpha} = \cosh \alpha - \sinh \alpha$
- (5)  $e^{\alpha+j\beta} = e^{\alpha} \cos \beta + j e^{\alpha} \sin \beta$   
 $= (\cosh \alpha \cos \beta + \sinh \alpha \cos \beta)$   
 $+ j(\cosh \alpha \sin \beta + \sinh \alpha \sin \beta)$

**b. Relation between hyperbolic and circular functions:**

- (1)  $\sinh j\beta = j \sin \beta$
- (2)  $\cosh j\beta = \cos \beta$
- (3)  $\sin j\beta = j \sinh \beta$
- (4)  $\cos j\beta = \cosh \beta$

**c. Hyperbolic functions:**

- (1)  $\sinh \beta = \frac{e^{\beta} - e^{-\beta}}{2}$
- (2)  $\cosh \beta = \frac{e^{\beta} + e^{-\beta}}{2}$
- (3)  $\tanh \beta = \frac{e^{\beta} - e^{-\beta}}{e^{\beta} + e^{-\beta}}$
- (4)  $\sinh (-\beta) = -\sinh \beta$
- (5)  $\cosh (-\beta) = \cosh \beta$
- (6)  $\cosh^2 \beta - \sinh^2 \beta = 1$
- (7)  $\sinh (\alpha + \beta) = \sinh \alpha \cosh \beta + \cosh \alpha \sinh \beta$
- (8)  $\sinh (\alpha - \beta) = \sinh \alpha \cosh \beta - \cosh \alpha \sinh \beta$
- (9)  $\cosh (\alpha + \beta) = \cosh \alpha \cosh \beta + \sinh \alpha \sinh \beta$

**d. Circular and hyperbolic functions of complex quantities:**

- (1)  $\sinh (\alpha \pm j\beta) = \sinh \alpha \cosh j\beta \pm \cosh \alpha \sinh j\beta$   
 $= \sinh \alpha \cos \beta \pm j \cosh \alpha \sin \beta$   
 $= \sqrt{\sinh^2 \alpha + \sin^2 \beta} / \pm \tan^{-1} \frac{\tan \beta}{\tanh \alpha}$
- (2)  $\cosh (\alpha \pm j\beta) = \cosh \alpha \cosh j\beta \pm \sinh \alpha \sinh j\beta$   
 $= \cosh \alpha \cos \beta \pm j \sinh \alpha \sin \beta$   
 $= \sqrt{\sinh^2 \alpha + \cos^2 \beta} / \pm \tan^{-1} (\tan \beta \tanh \alpha)$
- (3)  $\sin (\alpha \pm j\beta) = \sin \alpha \cos j\beta \pm \cos \alpha \sin j\beta$   
 $= \sin \alpha \cosh \beta \pm j \cos \alpha \sinh \beta$   
 $= \sqrt{\sin^2 \alpha + \sinh^2 \beta} / \pm \tan^{-1} \frac{\tan \beta}{\tan \alpha}$
- (4)  $\cos (\alpha \pm j\beta) = \cos \alpha \cos j\beta \mp \sin \alpha \sin j\beta$   
 $= \cos \alpha \cosh \beta \mp j \sin \alpha \sinh \beta$   
 $= \sqrt{\cos^2 \alpha + \sinh^2 \beta} / \mp \tan^{-1} (\tanh \beta \tan \alpha)$

$$\begin{aligned} \int x e^{ax} \, dx &= \frac{1}{a^2} e^{ax} (ax - 1) \\ \int e^{at} \sin (\omega t + \psi) \, dt &= \frac{e^{at}}{\alpha^2 + \omega^2} [\alpha \sin (\omega t + \psi) - \omega \cos (\omega t + \psi)] \\ \int e^{at} \cos (\omega t + \psi) \, dt &= \frac{e^{at}}{\alpha^2 + \omega^2} [\alpha \cos (\omega t + \psi) + \omega \sin (\omega t + \psi)] \\ \operatorname{Si}(x) &= \int_0^x \frac{\sin x}{x} \, dx \\ \operatorname{Ci}(x) &= \int_{\infty}^x \frac{\cos x}{x} \, dx \\ J_0(x) &= \frac{1}{2\pi} \int_0^{2\pi} \cos (x \sin \theta) \, d\theta = \frac{1}{2\pi} \int_0^{2\pi} \cos (x \cos \theta) \, d\theta \\ &= \frac{1}{\pi} \int_0^{\pi} \cos (x \cos \theta) \, d\theta \\ &= \frac{j}{2\pi} \int_0^{2\pi} \sin (x \sin \theta) \, d\theta \\ &= \frac{1}{2\pi} \int_0^{2\pi} e^{jx \sin \theta} \, d\theta = \frac{1}{2\pi} \int_0^{2\pi} e^{jx \cos \theta} \, d\theta = \frac{1}{\pi} \int_0^{\pi} e^{jx \cos \theta} \, d\theta \\ J_n(x) &= \frac{1}{\pi} \int_0^{\pi} \cos (n\theta - x \sin \theta) \, d\theta \\ &= \frac{j}{\pi} \int_0^{\pi} \sin (n\theta - x \sin \theta) \, d\theta \\ &= \frac{1}{\pi} \int_0^{\pi} e^{j(n\theta - x \sin \theta)} \, d\theta \end{aligned}$$

## 21. SERIES

**a. Exponential:**

$$(1) e^x = 1 + x + \frac{x^2}{2} + \frac{x^3}{3} + \dots$$

$$(2) a^x = 1 + x \log a + \frac{(x \log a)^2}{2} + \frac{(x \log a)^3}{3} + \dots$$

**b. Trigonometric:**

$$(1) \sin x = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \dots$$

$$(2) \cos x = 1 - \frac{x^2}{2} + \frac{x^4}{4} - \frac{x^6}{6} + \dots$$

$$(3) \tan x = x + \frac{x^3}{3} + \frac{2x^5}{15} + \frac{17x^7}{315} + \dots$$

**c. Hyperbolic:**

$$(1) \sinh x = x + \frac{x^3}{3} + \frac{x^5}{5} + \frac{x^7}{7} + \dots$$

$$(2) \cosh x = 1 + \frac{x^2}{2} + \frac{x^4}{4} + \frac{x^6}{6} + \dots$$

$$(3) \tanh x = x - \frac{x^3}{3} + \frac{2x^5}{15} - \frac{17x^7}{315} + \dots$$

**d. Logarithmic:**

$$\ln(1+x) = x - \frac{1}{2}x^2 + \frac{1}{3}x^3 - \frac{1}{4}x^4 + \dots$$

**e. Sine and cosine integral:**

$$\text{Si}(x) = \int_0^x \frac{\sin x}{x} dx = x - \frac{x^3}{3 \cdot 3} + \frac{x^5}{5 \cdot 5} - \dots$$

$$\text{Ci}(x) = \int_{-\infty}^x \frac{\cos x}{x} dx = \gamma + \ln x - \frac{x^2}{2 \cdot 2} + \frac{x^4}{4 \cdot 4} - \frac{x^6}{6 \cdot 6} + \dots$$

**f. Bessel's:**

$$(1) J_0(x) = 1 - \frac{x^2}{2} + \frac{x^4}{2^2 \cdot 4^2} - \frac{x^6}{2^2 \cdot 4^2 \cdot 6^2} + \dots$$

$$(2) J_n(x) = \frac{x^n}{2^n n!} \left[ 1 - \frac{x^2}{2(2n+2)} + \frac{x^4}{2 \cdot 4(2n+2)(2n+4)} - \frac{x^6}{2 \cdot 4 \cdot 6(2n+2)(2n+4)(2n+6)} + \dots \right]$$

$$= \sum_{k=0}^{k=\infty} \frac{(-1)^k}{k! (n+k)!} \left( \frac{x}{2} \right)^{n+2k} \quad (n \text{ an integer})$$

**g. Binomial:**

$$(1 \pm x)^n = 1 \pm nx + \frac{n(n-1)}{2} x^2 \pm \frac{n(n-1)(n-2)}{3} x^3 + \dots$$

**h. Power:**

$$f(x) = a_0 + a_1x + a_2x^2 + a_3x^3 + \dots$$

i. Maclaurin's:

$$f(x) = f(0) + xf'(0) + \frac{x^2}{2}f''(0) + \frac{x^3}{3}f'''(0) + \dots$$

j. Taylor's:

$$(1) f(x) = f(a) + (x-a)f'(a) + \frac{(x-a)^2}{2}f''(a) + \frac{(x-a)^3}{3}f'''(a) + \dots$$

$$(2) f(x+h) = f(x) + hf'(x) + \frac{h^2}{2}f''(x) + \frac{h^3}{3}f'''(x) + \dots$$

k. Fourier's:

$$(1) f(x) = \frac{A_0}{2} + A_1 \sin x + A_2 \cos 2x + A_3 \cos 3x + \dots$$

$$+ B_1 \cos x + B_2 \cos 2x + B_3 \cos 3x + \dots$$

$$= \frac{A_0}{2} + \sum_{n=1}^{\infty} (A_n \cos nx + B_n \sin nx)$$

$$\text{where } A_0 = \frac{1}{\pi} \int_0^{2\pi} f(x) dx$$

$$A_n = \frac{1}{\pi} \int_0^{2\pi} f(x) \cos nx dx$$

$$B_n = \frac{1}{\pi} \int_0^{2\pi} f(x) \sin nx dx$$

$$(2) f(x) = M_0 + M_1 \sin(\omega t + \psi_1) + M_2 \sin(\omega t + \psi_2) + \dots$$

$$= \sum_{n=0}^{\infty} M_n \sin(\omega t + \psi_n)$$

where  $n = 0$

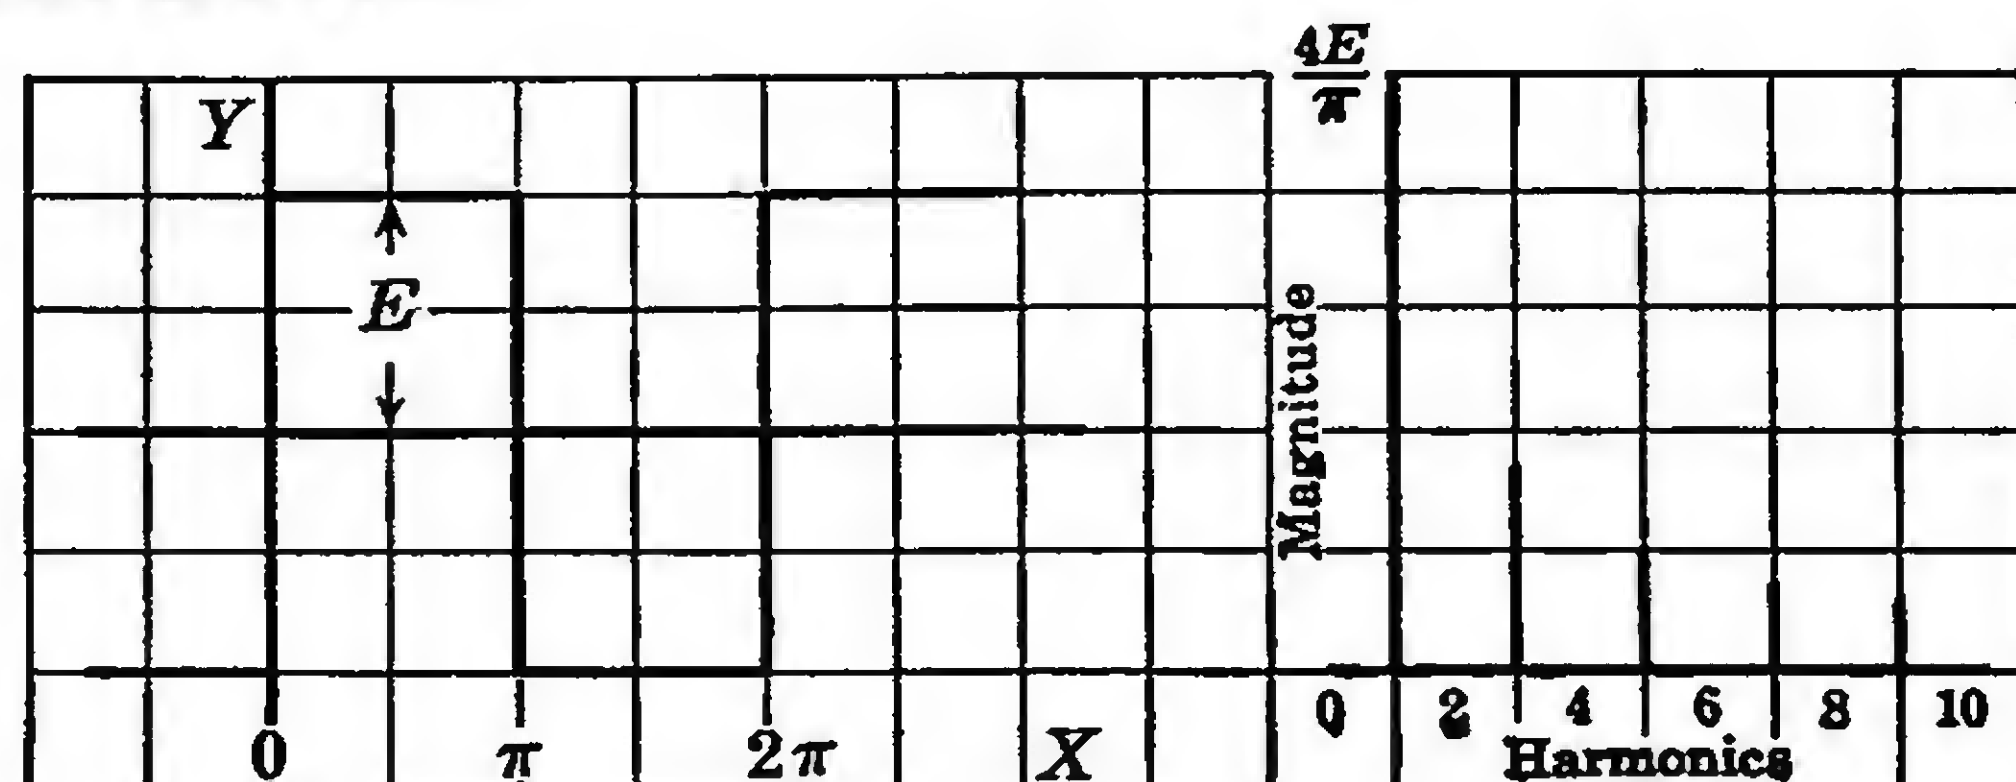

$$M_0 = \frac{1}{2\pi} \int_0^{2\pi} f(x) dx$$

and for  $n = 1, 2, 3, \dots$

$$M_n \angle \psi_n = \frac{j}{\pi} \int_0^{2\pi} f(x) e^{-in x} dx$$

## 22. WAVEFORMS

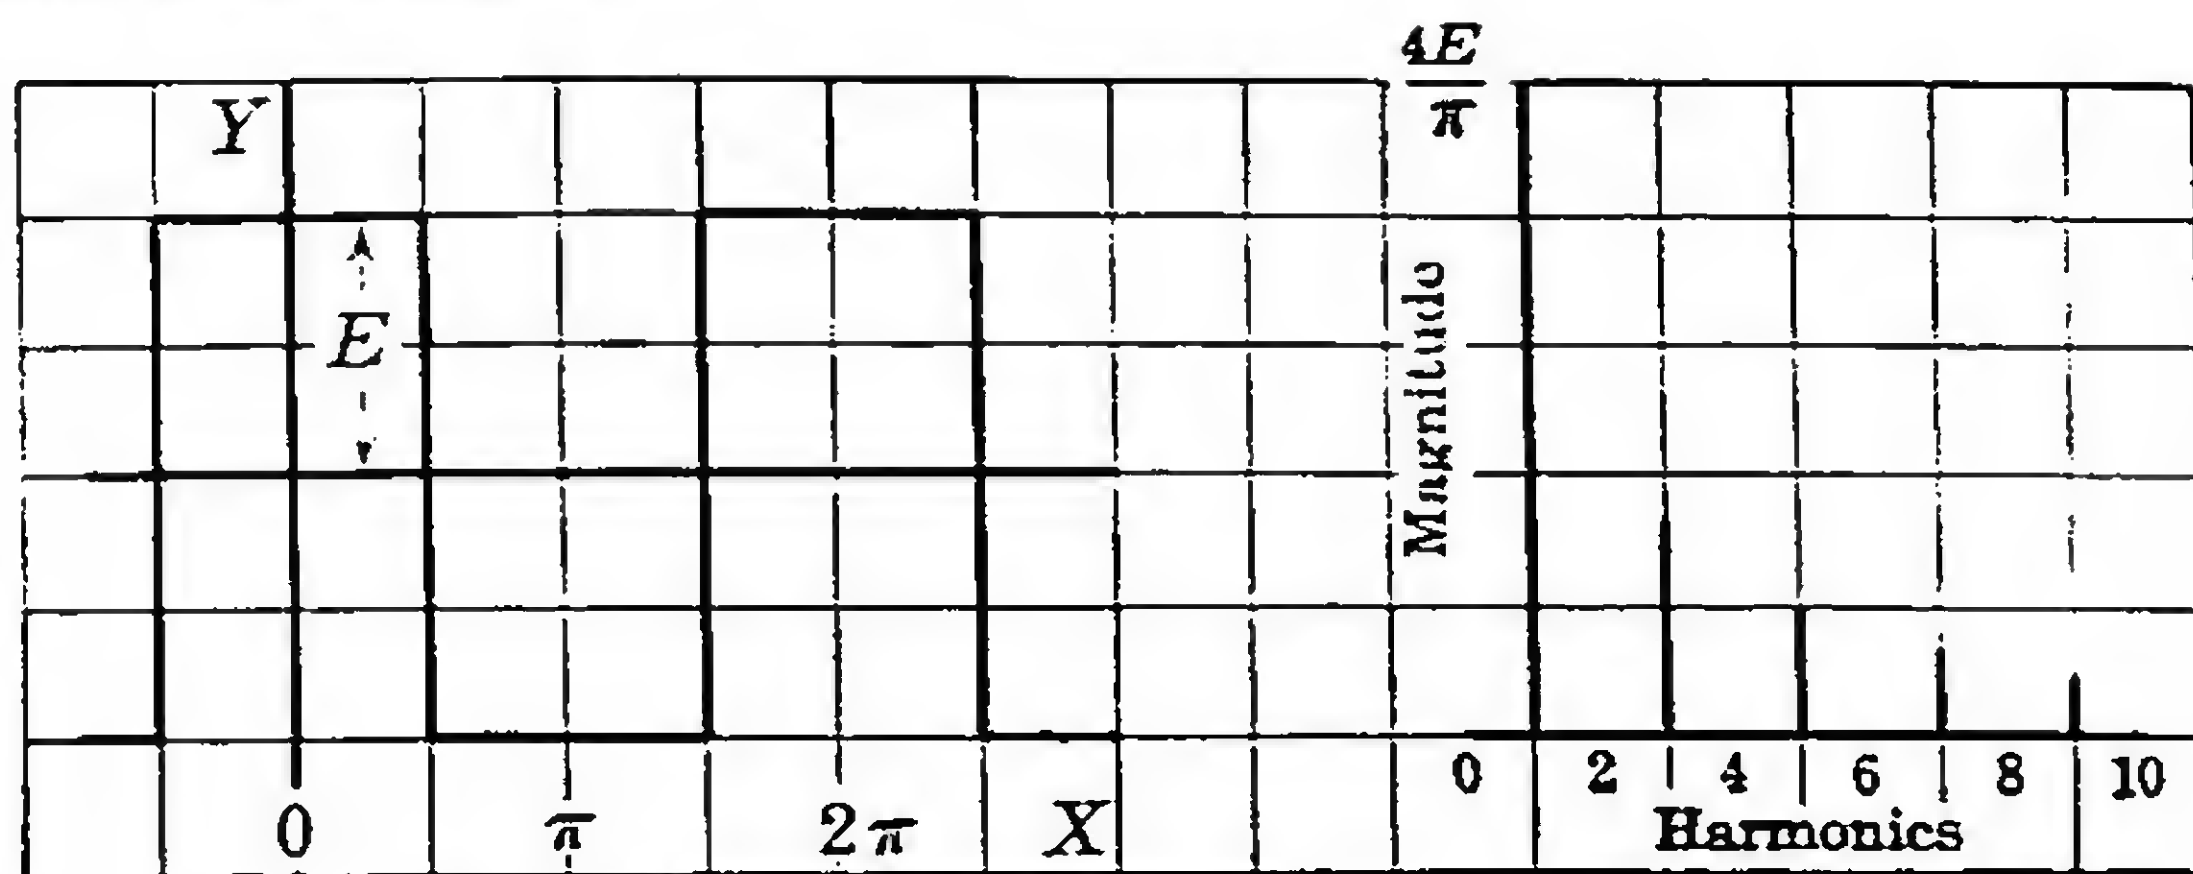

a. Square sine wave:

$$y = \frac{4E}{\pi} \sum_{n=1}^{\infty} \frac{1}{2n-1} \sin(2n-1)x$$

$$= \frac{4E}{\pi} \left[ \sin x + \frac{1}{3} \sin 3x + \frac{1}{5} \sin 5x + \dots \right]$$

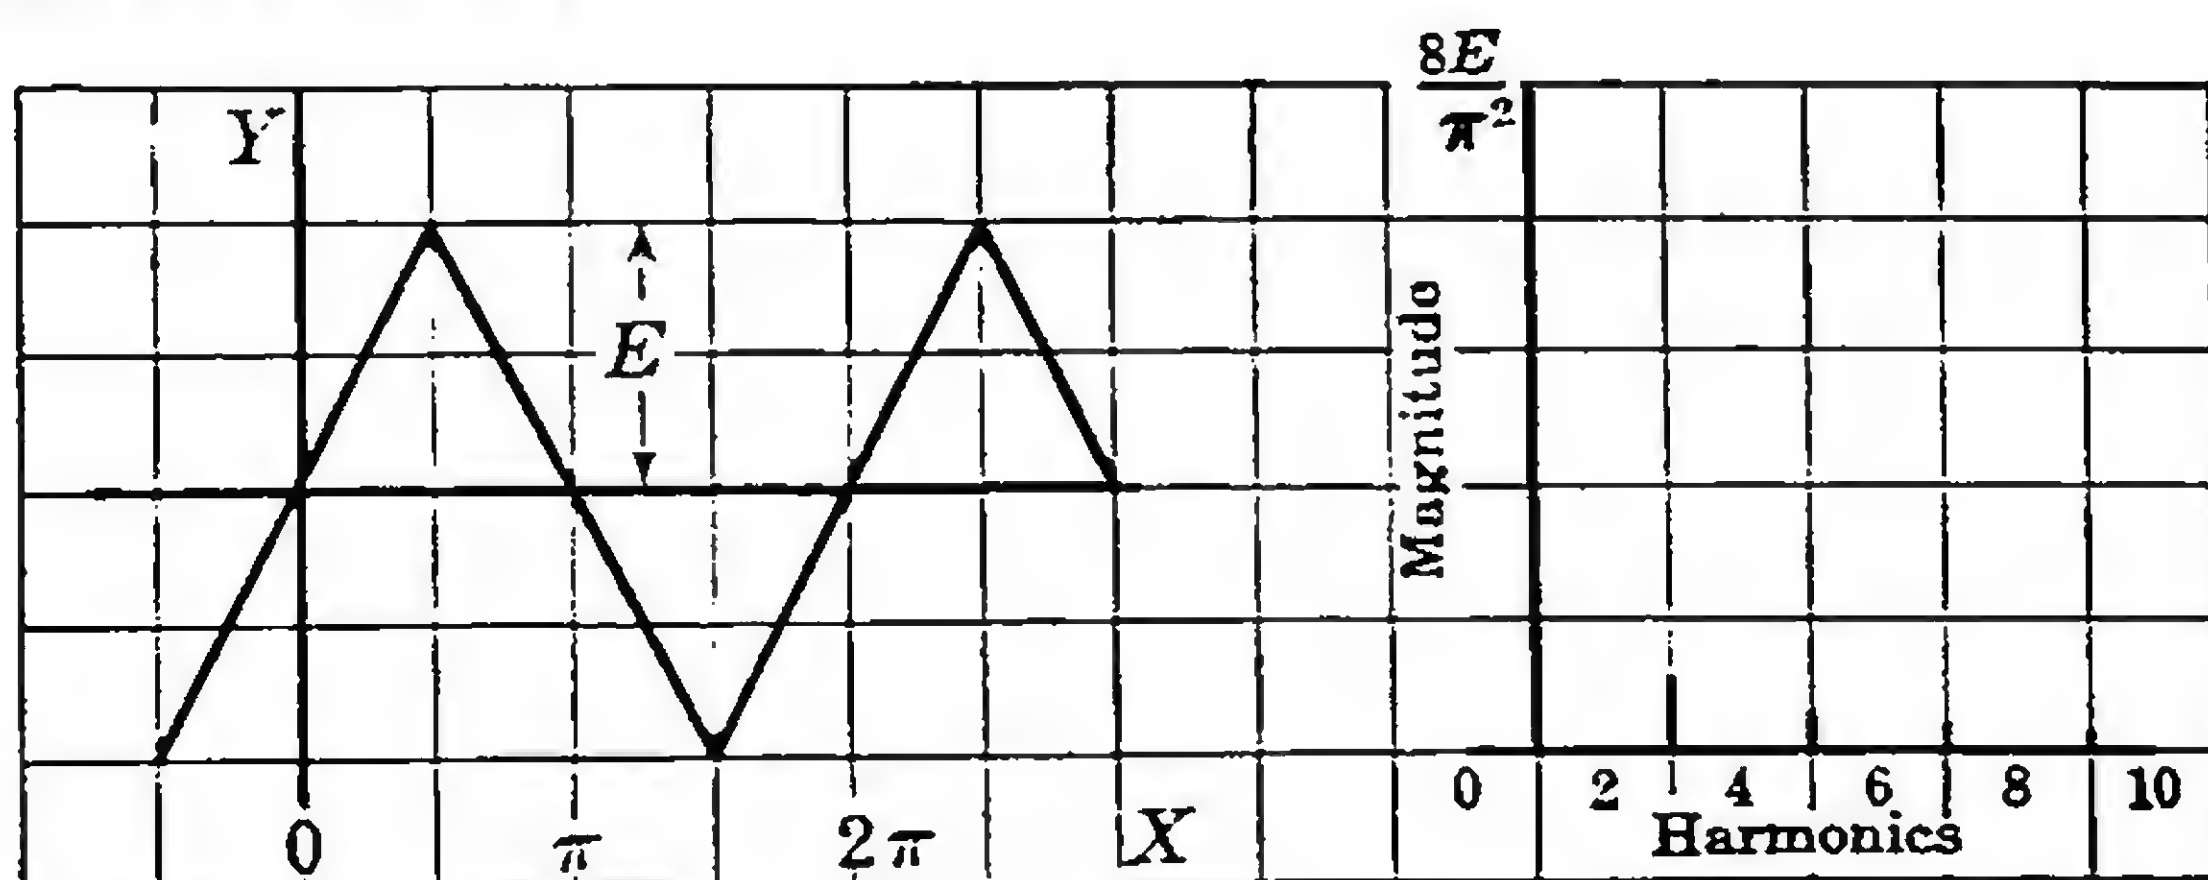

c. Square cosine wave:

$$y = \frac{4E}{\pi} \sum_{n=1}^{\infty} \frac{1}{2n-1} \sin(2n-1)x$$

$$= \frac{4E}{\pi} \left[ \cos x - \frac{1}{3} \cos 3x + \frac{1}{5} \cos 5x - \dots \right]$$

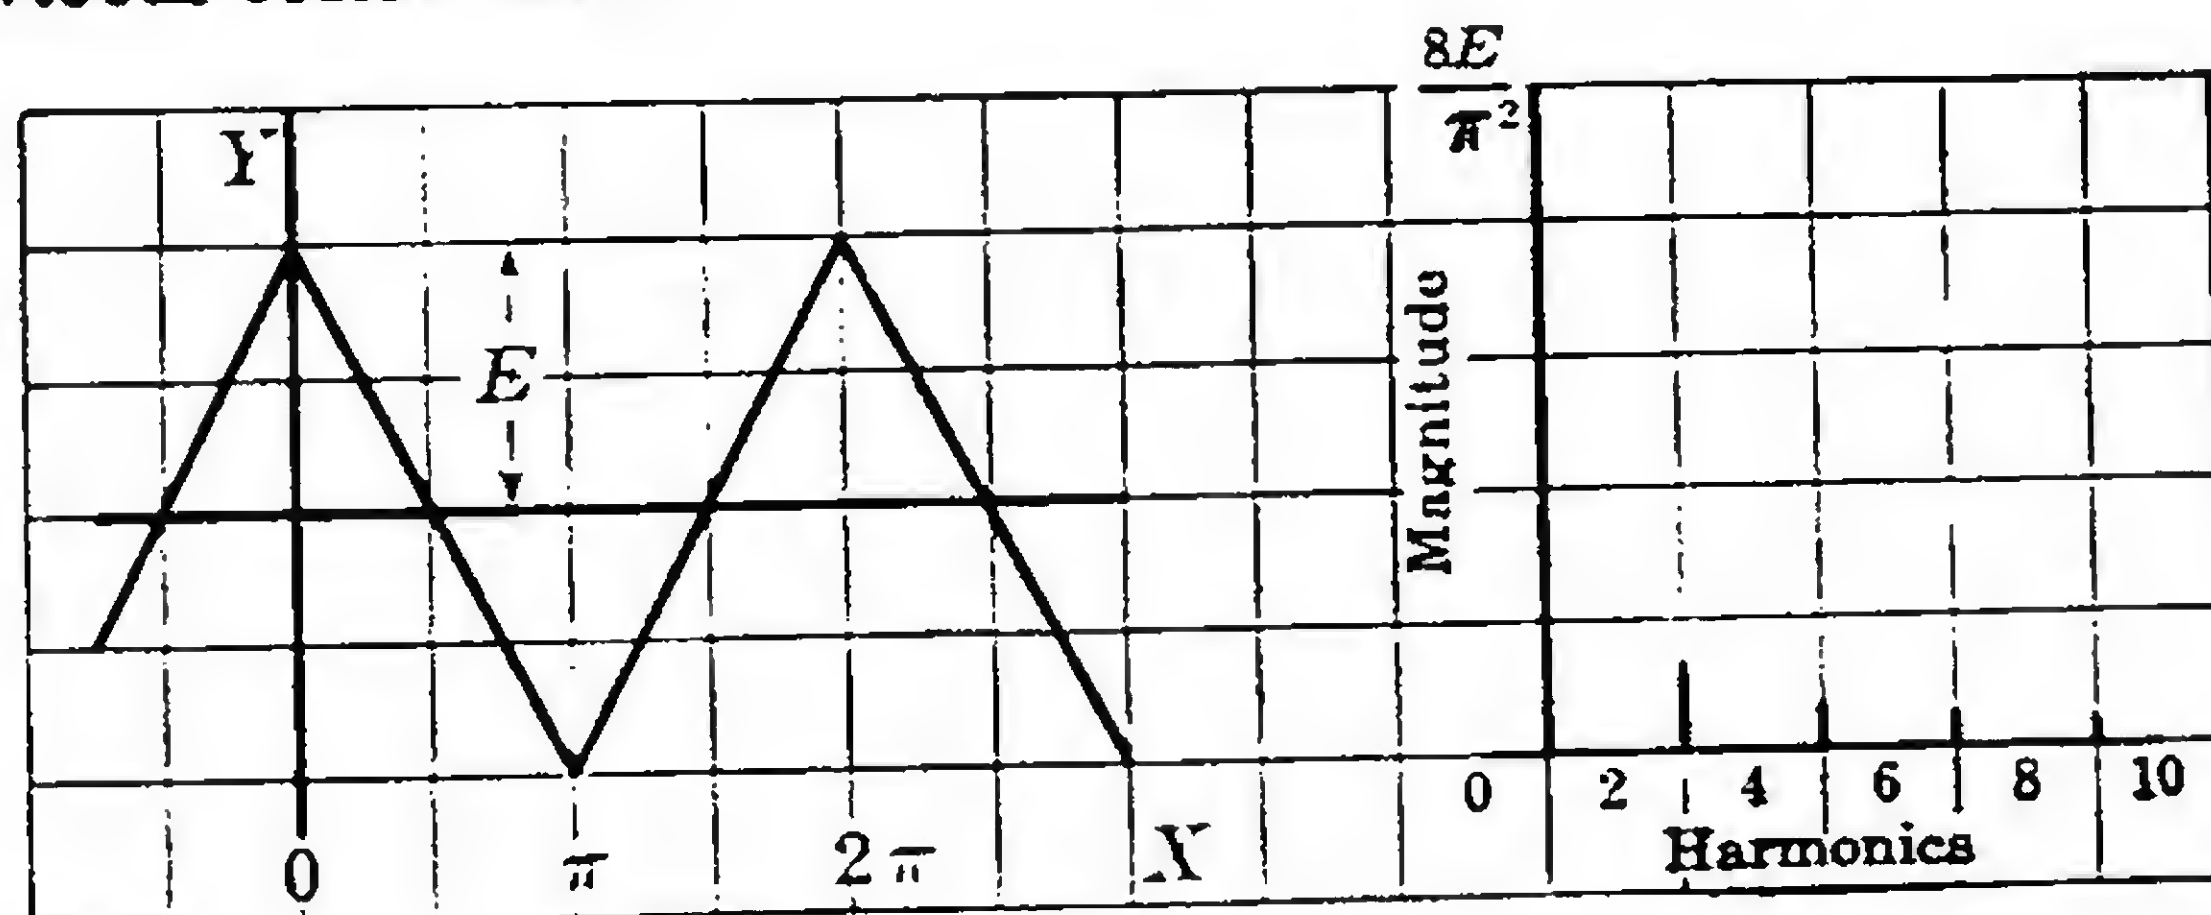

d. Sawtooth sine wave:

$$y = \frac{8E}{\pi^2} \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{(2n-1)^2} \sin(2n-1)x$$

$$= \frac{8E}{\pi^2} \left[ \sin x - \frac{1}{9} \sin 3x + \frac{1}{25} \sin 5x - \dots \right]$$

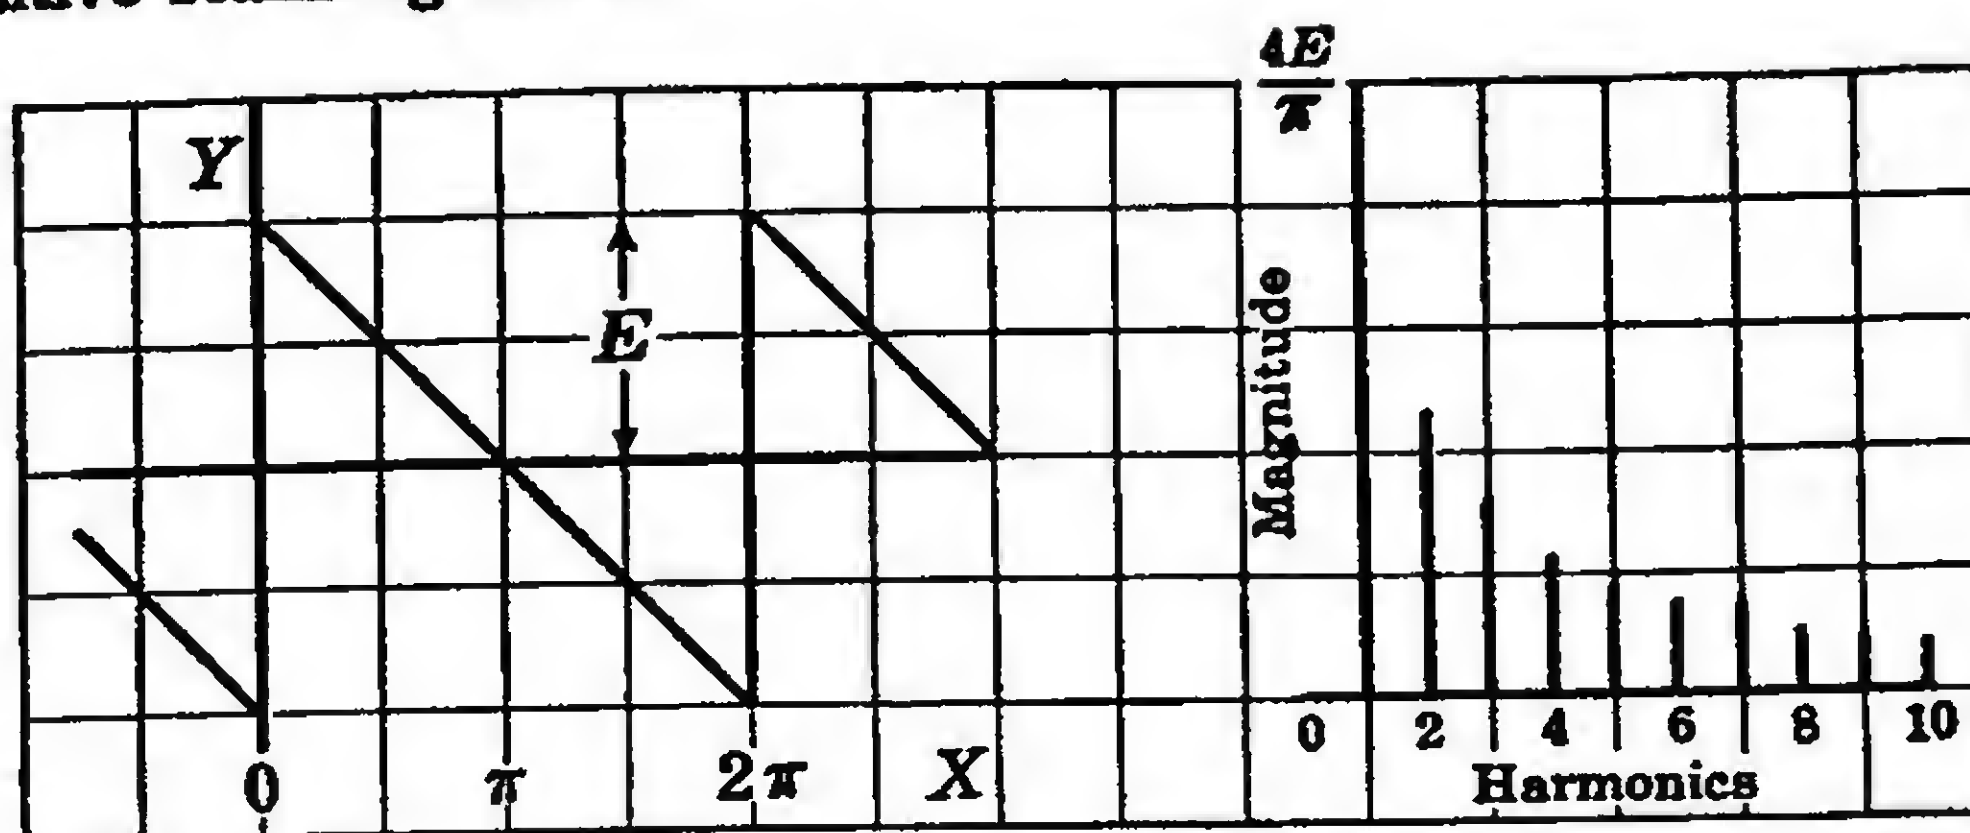

d. Sawtooth cosine wave:

$$y = \frac{8E}{\pi^2} \sum_{n=1}^{\infty} \frac{1}{(2n-1)^2} \cos(2n-1)x$$

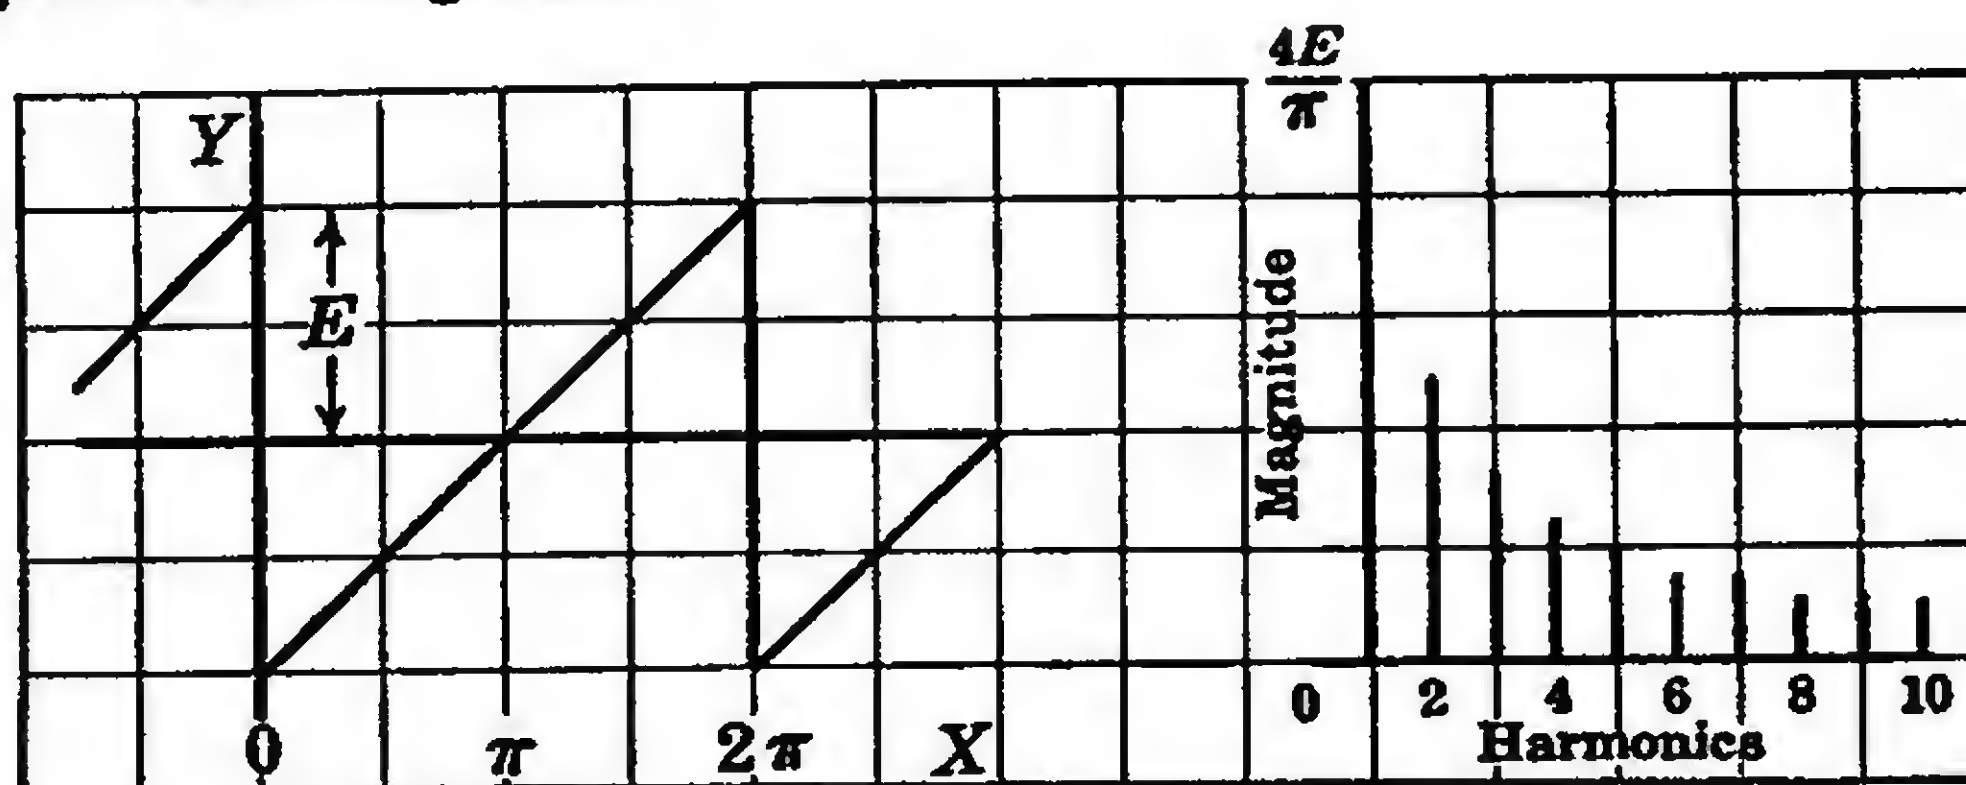

$$= \frac{8E}{\pi^2} \left[ \cos x + \frac{1}{9} \cos 3x + \frac{1}{25} \cos 5x + \dots \right]$$

e. Positive scanning wave:

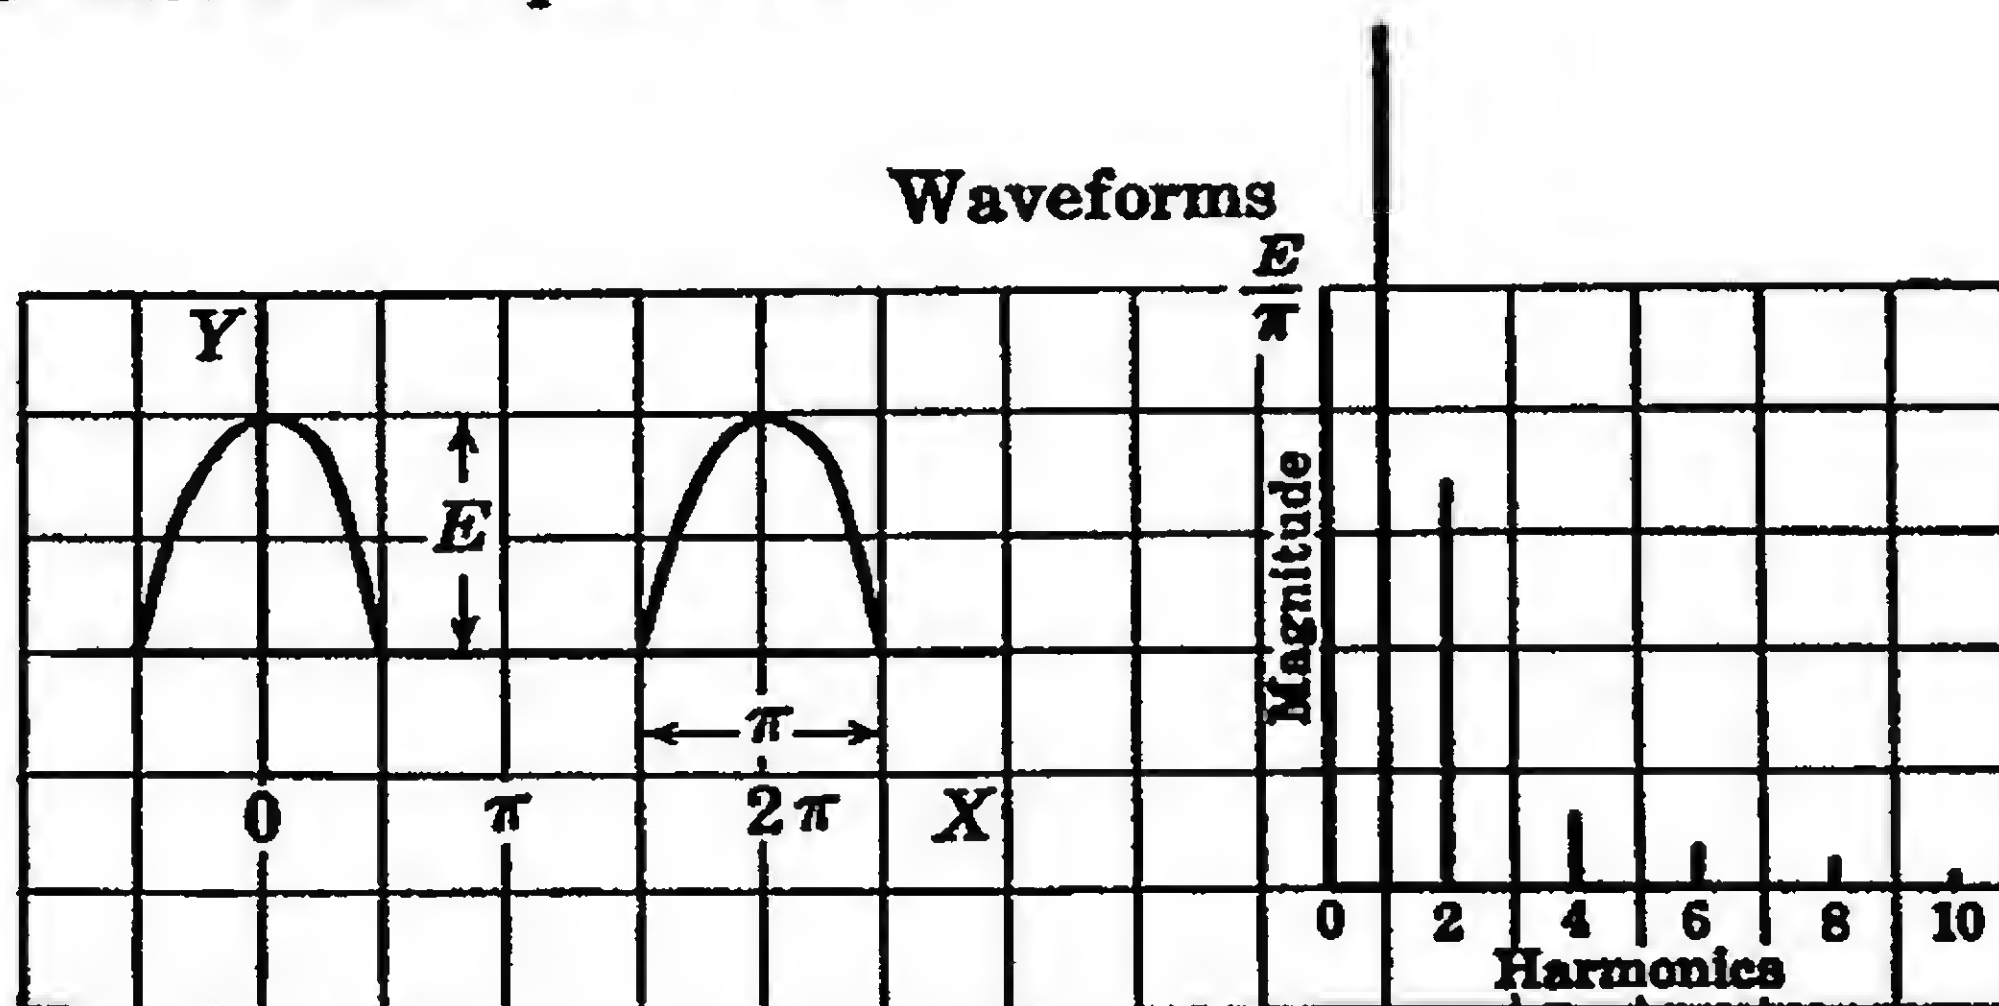

$$y = \frac{2E}{\pi} \sum_{n=1}^{\infty} \frac{\sin nx}{n} = \frac{2E}{\pi} \left[ \sin x + \frac{1}{2} \sin 2x + \frac{1}{3} \sin 3x + \dots \right]$$

f. Negative scanning wave:

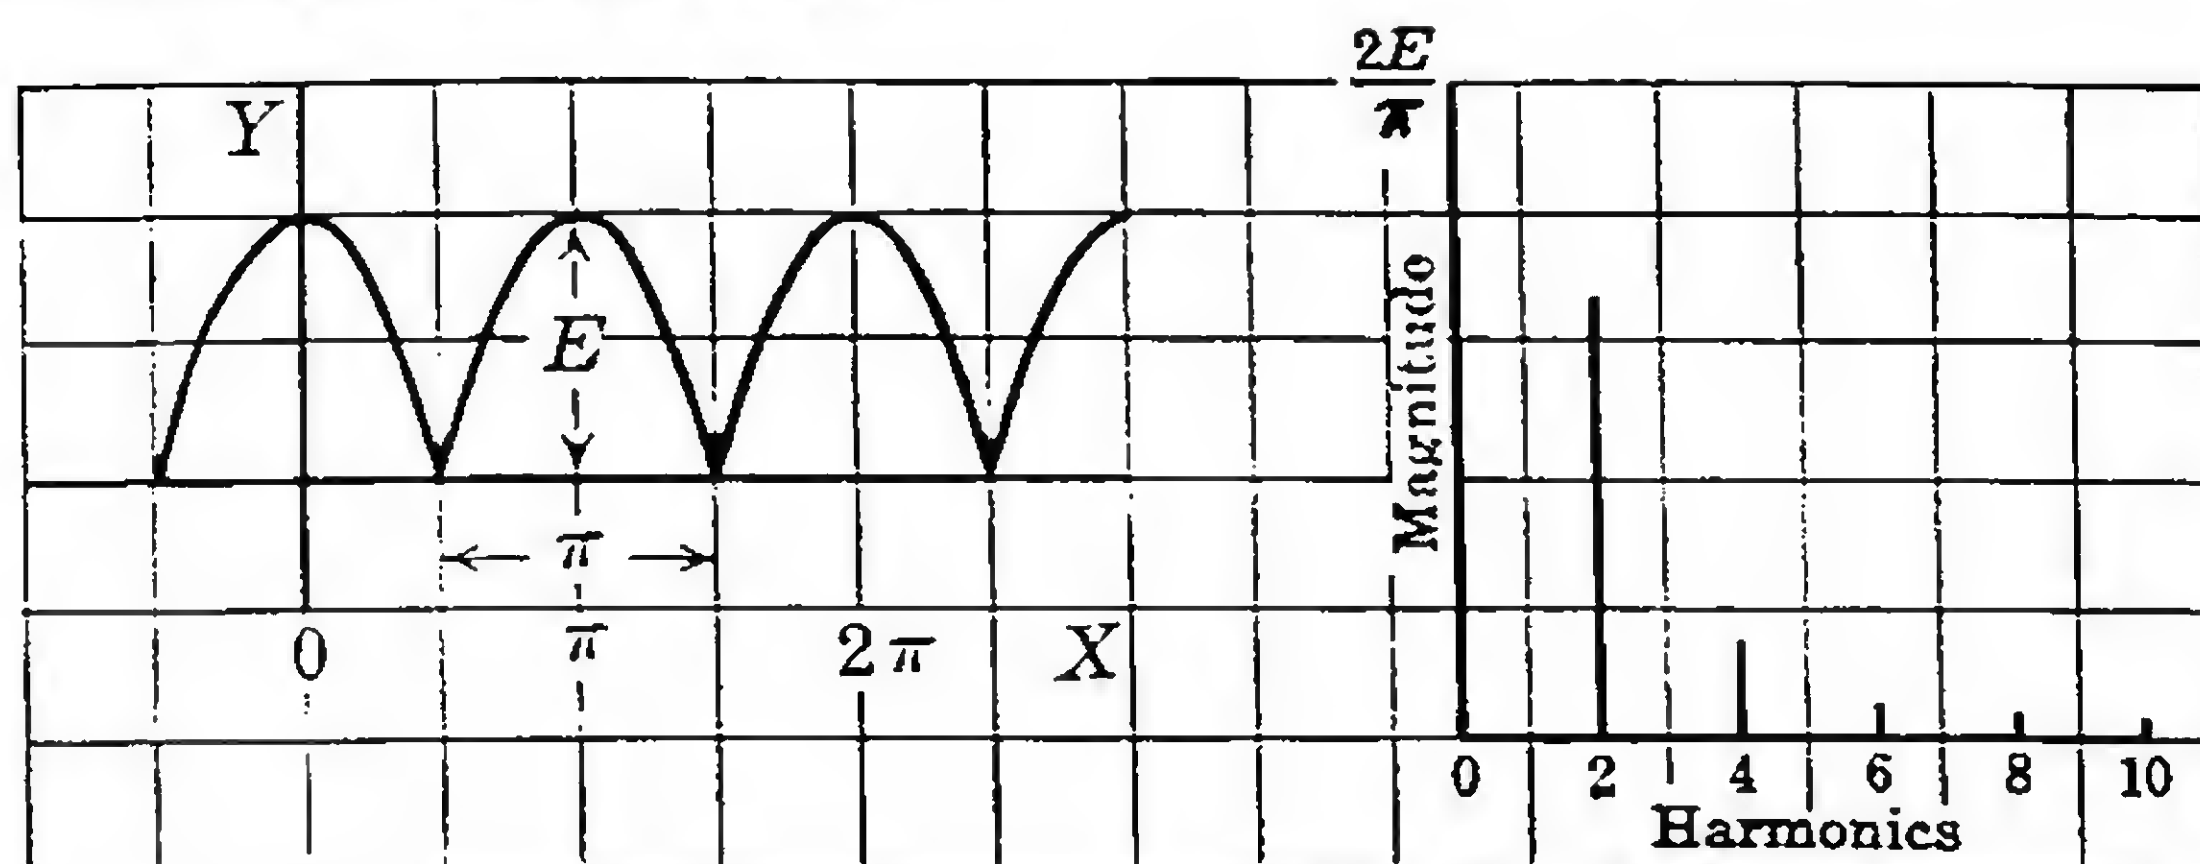

$$y = -\frac{2E}{\pi} \sum_{n=1}^{\infty} \frac{\sin nx}{n} = \frac{2E}{\pi} \left[ -\sin x - \frac{1}{2} \sin 2x - \frac{1}{3} \sin 3x - \dots \right]$$

g. Half-wave rectifier pulse wave:

$$\begin{aligned} y &= \frac{E}{\pi} + \frac{E}{2} \cos x + \frac{2E}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{4n^2 - 1} \cos 2nx \\ &= \frac{E}{\pi} \left[ 1 + \frac{\pi}{2} \cos x + \frac{2}{3} \cos 2x - \frac{2}{15} \cos 4x + \dots \right] \end{aligned}$$

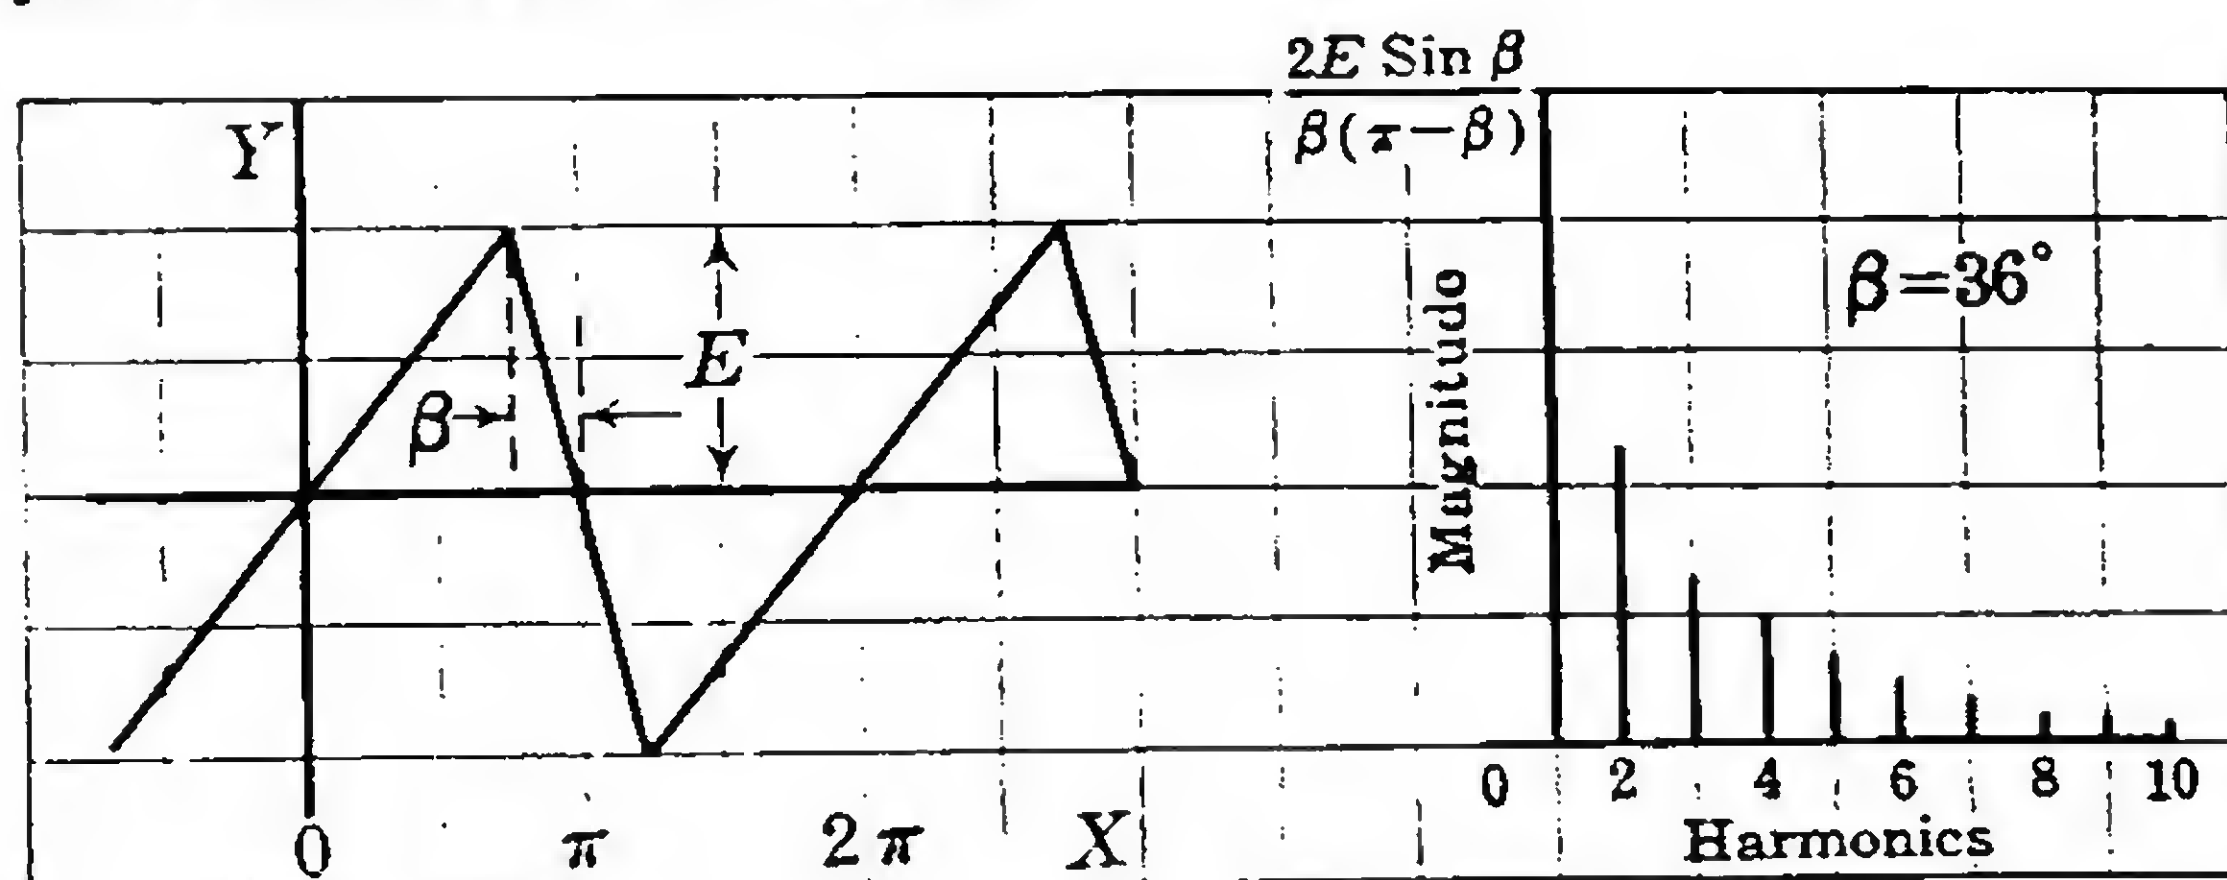

h. Full-wave rectifier pulse wave:

$$y = \frac{2E}{\pi} + \frac{4E}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{4n^2 - 1} \cos 2nx$$

$$= \frac{2E}{\pi} \left[ 1 + \frac{2}{3} \cos 2x - \frac{2}{15} \cos 4x + \frac{2}{35} \cos 6x - \dots \right]$$

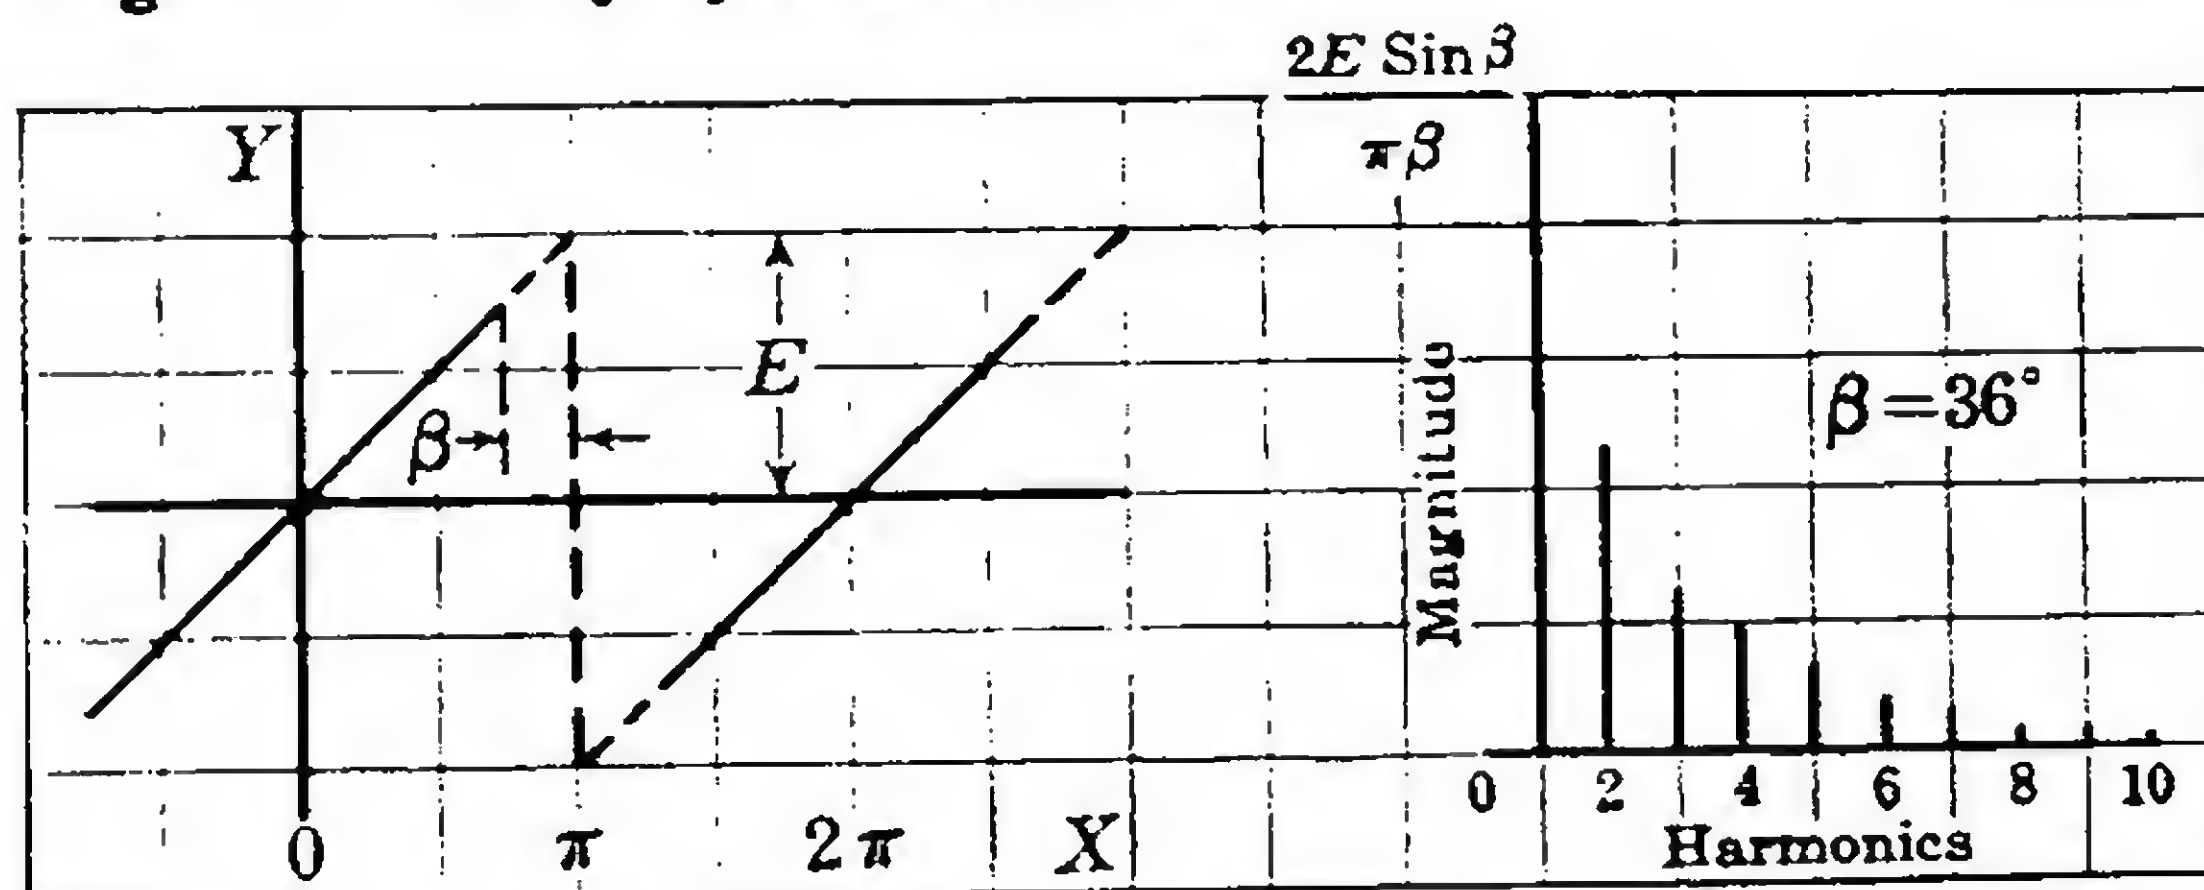

i. Unsymmetrical sawtooth wave:

$$y = \frac{2E}{\beta(\pi - \beta)} \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n^2} \sin n\beta \sin nx$$

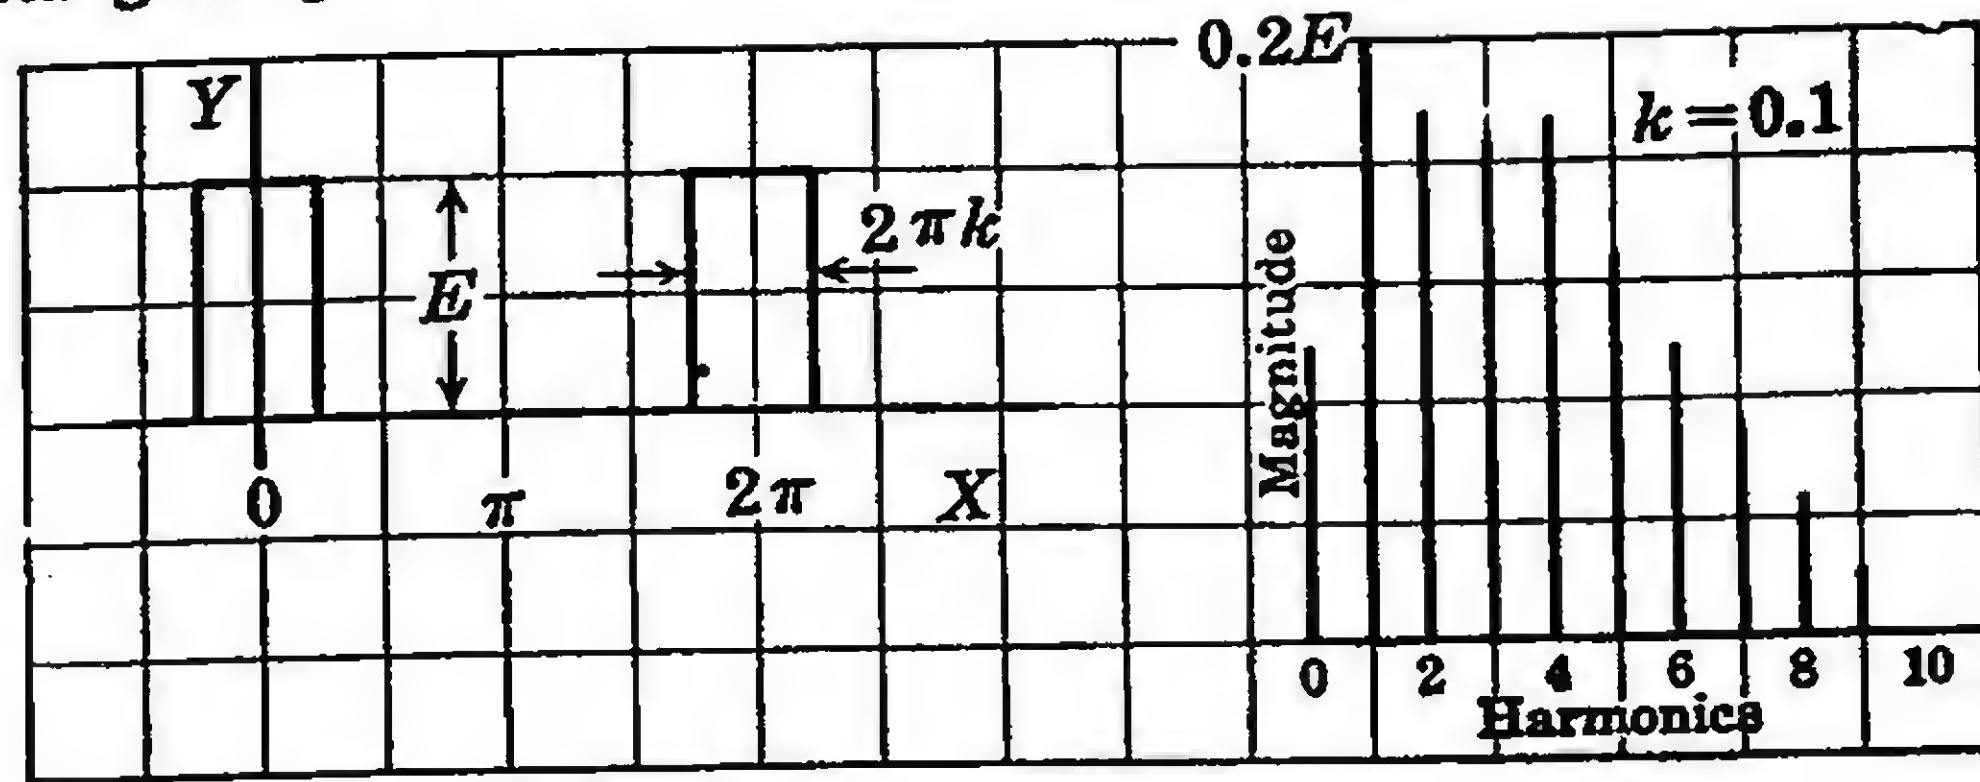

$$= \frac{2E}{\beta(\pi - \beta)} \left[ \sin \beta \sin x - \frac{1}{4} \sin 2\beta \sin 2x + \frac{1}{9} \sin 3\beta \sin 3x - \dots \right]$$

Scanning wave with 3 flyback time:

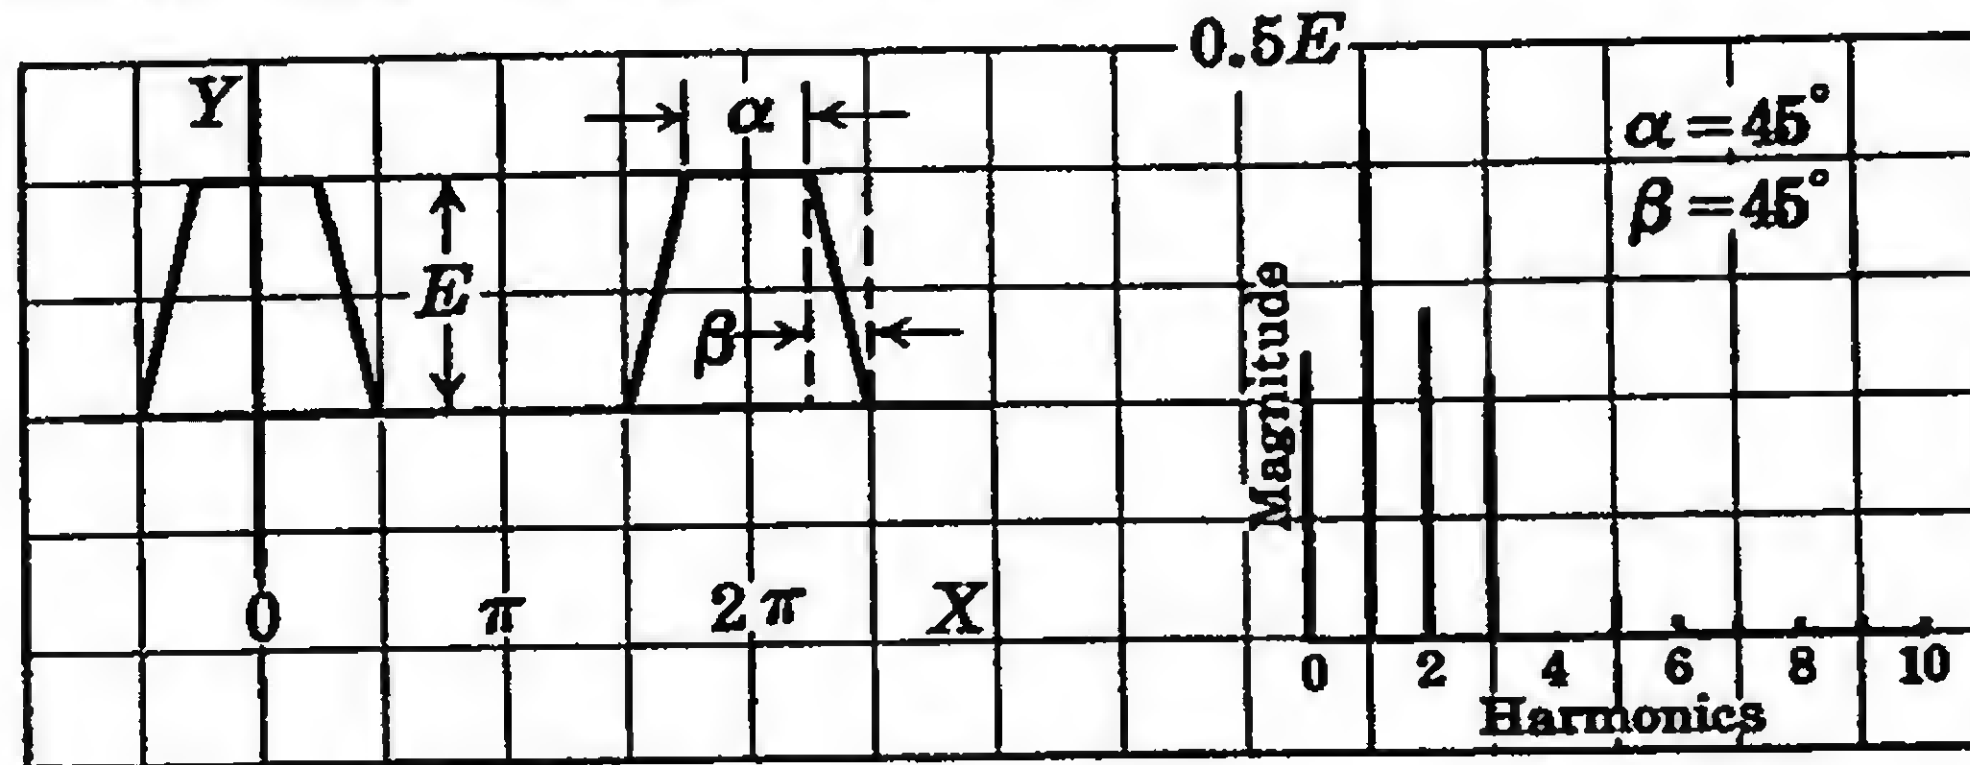

$$y = \frac{2E}{\pi \beta} \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n^2} \sin n\beta \sin nx$$

$$= \frac{2E}{\pi \beta} \left[ \sin \beta \sin x - \frac{1}{4} \sin 2\beta \sin 2x + \frac{1}{9} \sin 3\beta \sin 3x - \dots \right]$$

**k. Rectangular pulse wave:**

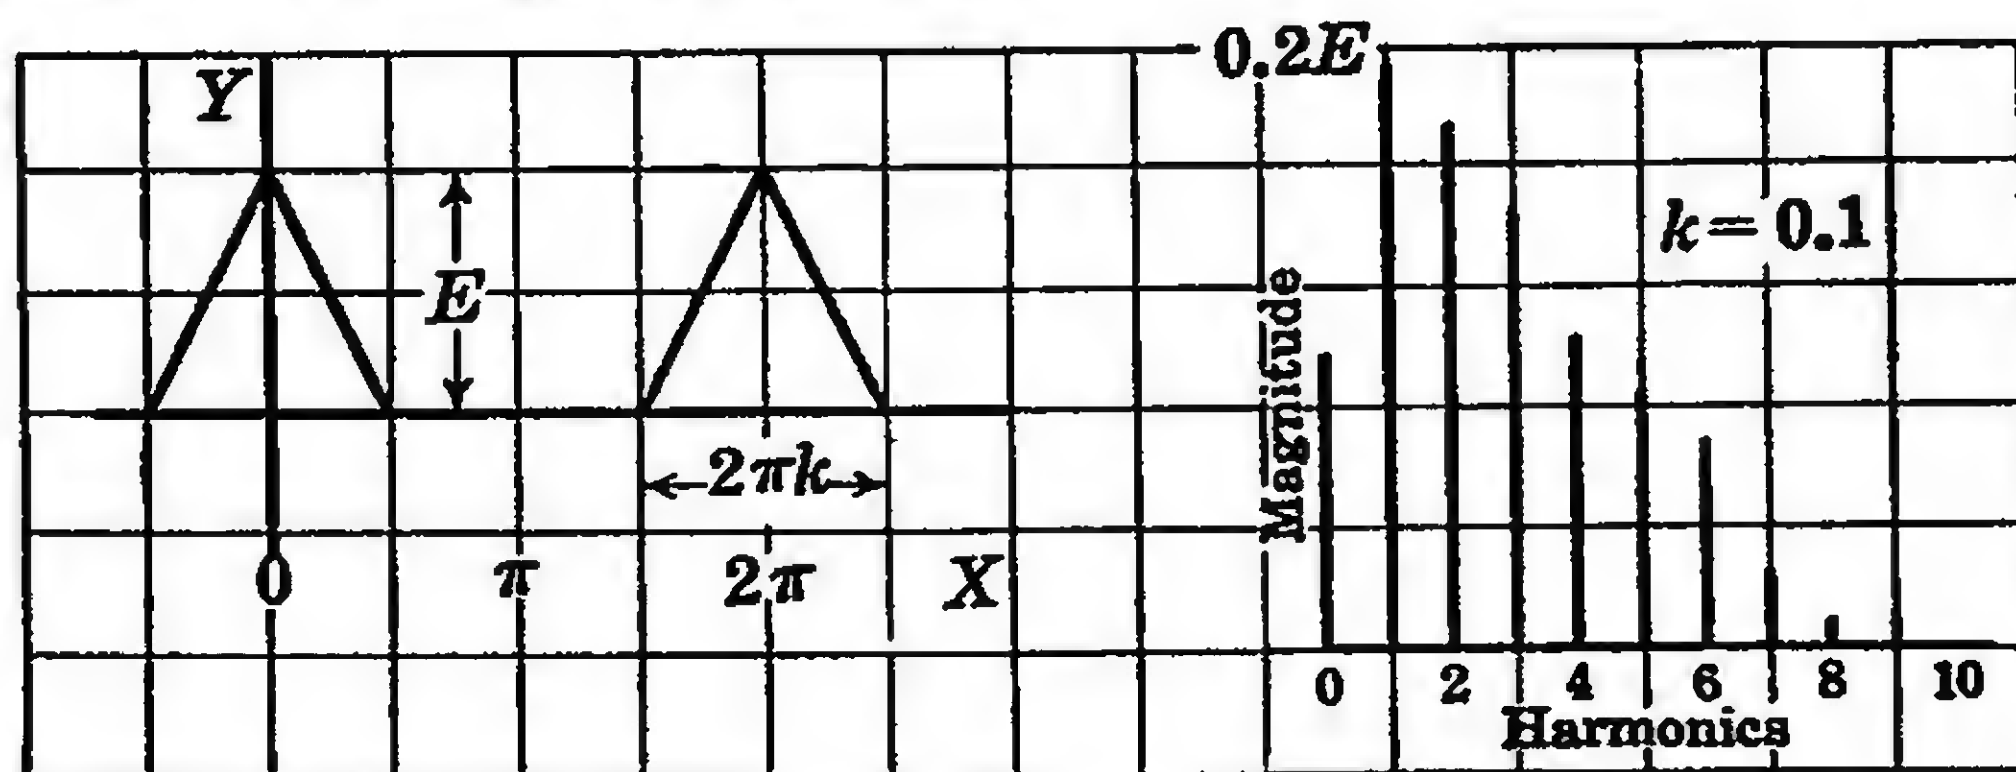

$$y = kE + \frac{2E}{\pi} \sum_{n=1}^{\infty} \frac{1}{n} \sin nk\pi \cos nx$$

$$= kE + \frac{2E}{\pi} \left[ \sin k\pi \cos(x) + \frac{1}{2} \sin 2k\pi \cos 2(x) + \dots \right]$$

**l. Symmetrical trapezoidal pulse wave:**

$$y = \frac{E}{2\pi} (\alpha + \beta) + \frac{8}{\beta} \sum_{n=1}^{\infty} \frac{1}{n^2} \sin \frac{n\beta}{2} \sin \frac{n}{2} (\alpha + \beta) \cos nx$$

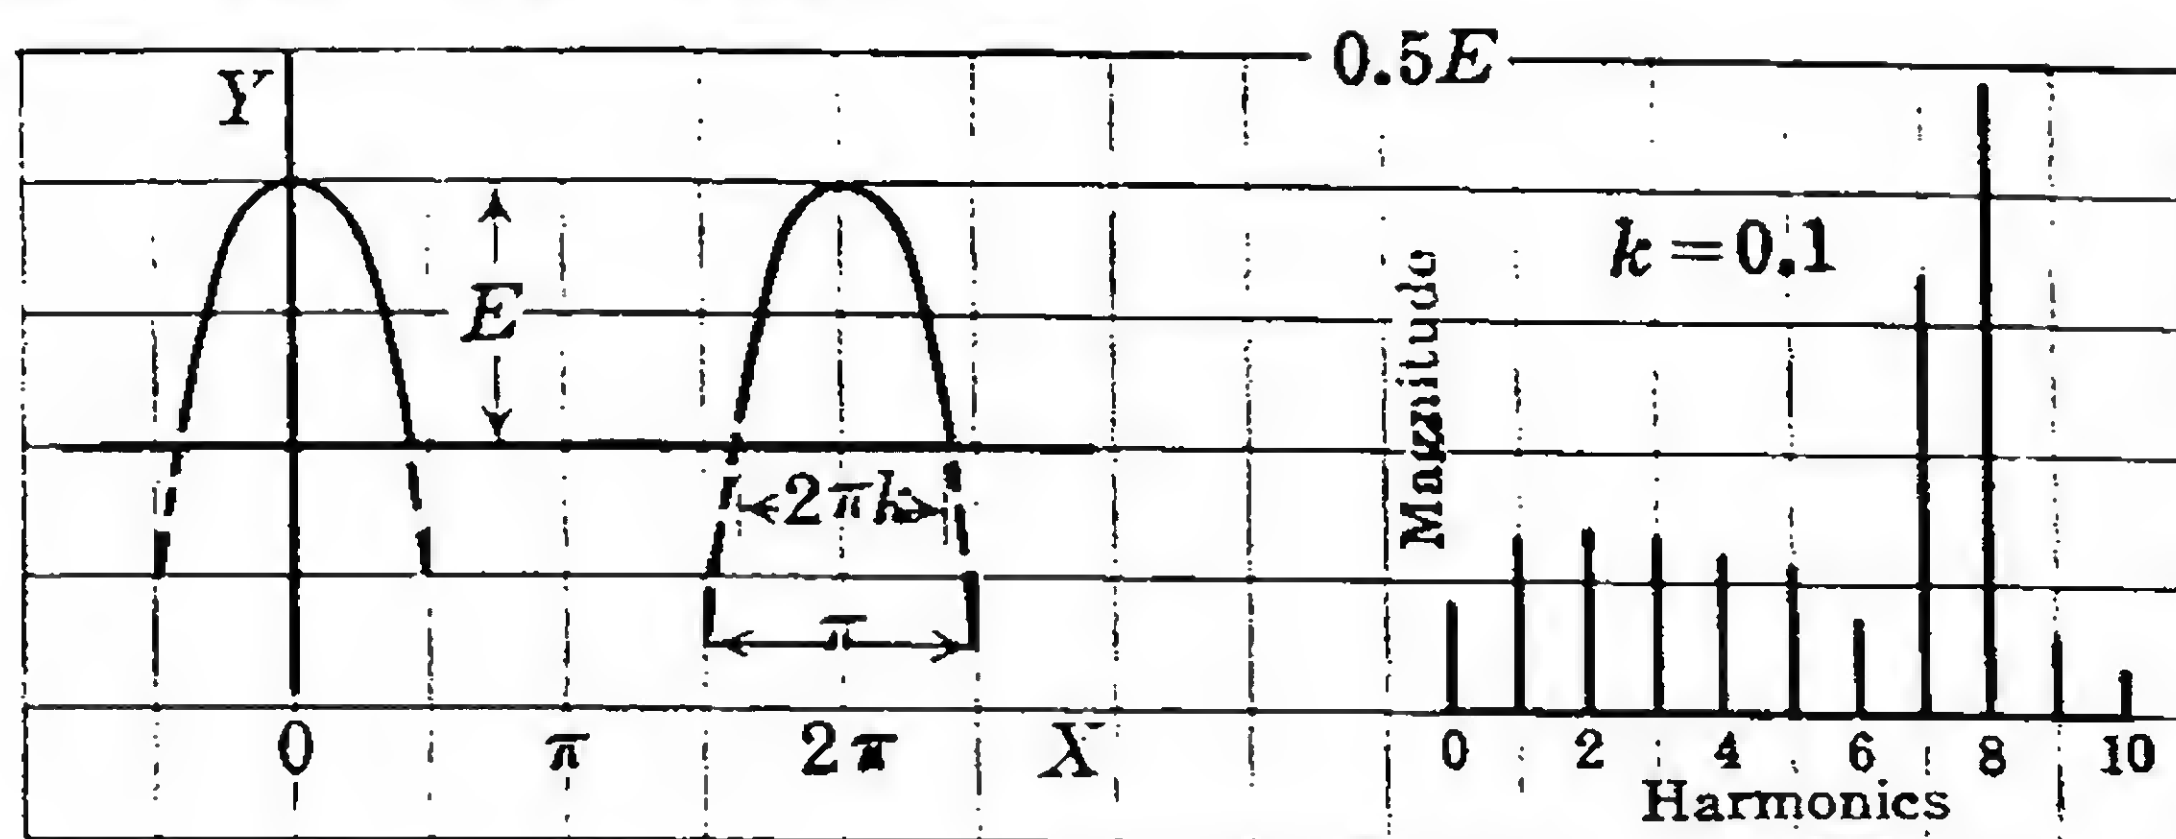

$$= \frac{E(\alpha + \beta)}{2\pi} + \frac{4E}{\pi\beta} \left[ \sin \frac{\beta}{2} \sin \left( \frac{\alpha + \beta}{2} \right) \cos x \right. \\ \left. + \frac{1}{4} \sin \beta \sin (\alpha + \beta) \cos 2x + \dots \right]$$

**m. Symmetrical triangular pulse wave:**

$$y = kE + \frac{2E}{k\pi^2} \sum_{n=1}^{\infty} \frac{1}{n^2} (\sin nk\pi)^2 \cos nx$$

$$= kE + \frac{2E}{k\pi^2} \left[ \sin^2 k\pi \cos x + \frac{1}{4} \sin^2 2k\pi \cos 2x + \dots \right]$$

n. Fractional cosine pulse wave:

$$\begin{aligned}
 y &= \frac{E}{\pi(1 - \cos k\pi)} \left[ \sin k\pi - k\pi \cos k\pi + (k\pi - \sin k\pi \cos k\pi) \cos x \right. \\
 &\quad \left. + \sum_{n=2}^{n=\infty} \left\{ \frac{\sin (n+1)k\pi}{n+1} + \frac{\sin (n-1)k\pi}{n-1} - \frac{2 \sin nk\pi \cos k\pi}{n} \right\} \cos nx \right] \\
 &= \frac{E}{\pi(1 - \cos k\pi)} \left[ \sin k\pi - k\pi \cos \pi k + (k\pi - \sin k\pi \cos k\pi) \cos x \right. \\
 &\quad \left. + \left( \frac{1}{3} \sin 3k\pi + \sin k\pi - \sin 2k\pi \cos k\pi \right) \cos 2x \right. \\
 &\quad \left. + \left( \frac{1}{4} \sin 4k\pi + \frac{1}{2} \sin 2k\pi - \frac{2}{3} \sin 3k\pi \cos k\pi \right) \cos 3x + \dots \right]
 \end{aligned}$$

# INDEX

---

## A

Abbreviations, list of, 234–243  
    engineering, 239  
    mathematical, 236  
Acceleration, 165  
Accuracy in interpolation, 23  
Addition, algebraic, 37, 54  
    arithmetic, 4, 54  
    of complex numbers, 92  
    of exponents, 10  
    of fractions, 7  
    geometric, 54–56  
    of like terms, 37  
    of mixed terms, 6  
    of negative terms, 3  
    of positive terms, 1  
    of real numbers, 2  
    rules, 4  
    of unlike terms, 37  
    of vectors, 54, 58, 76, 92  
Adjacent side of right triangle, 68  
Algebra, 35–53, 110–138  
    addition, 37, 55  
    cancellation, 42  
    division, 42  
    exponents, 40  
    integrals, 198  
    multiplication, 38  
    substitution, 39, 44  
    subtraction, 37  
Algebraic formulas, binomial theorem, 302  
    miscellaneous, 300  
    quadratic equations, 127–138, 302  
    Simpson's rule, 193, 302  
    simultaneous equations, 110–126, 301  
    trapezoidal rule, 192, 302  
Algebraic functions, defined, 149  
Alternating current, 50

Altitude, of right triangle, 56  
Angles, azimuth, 108  
    complimentary, 74  
    interior, 74  
    measurement of, 57  
    negative, 108  
    notation of, 234  
    positive, 108  
    sign of, 234  
    of vector, 79  
Answers to exercises, 327  
Antilogarithm, 21  
Approximations, using Maclaurin's series, 213  
    using Taylor's series, 215  
Arabic numerals, 1, 234  
Area, integration, 195, 205  
    by Simpson's rule, 193  
    by trapezoidal rule, 192  
Arithmetic, 1–16  
    rules, 4, 5  
Arithmetic addition, 54, 55  
Attenuation networks, 139

## B

Base, of logarithms, 17, 97, 180  
    of right triangle, 56  
Bessel functions, 217, 310  
    curves, 255–258  
    tables, 259–293  
Binomial theorem, 302  
Binomials, 212  
Braces, 235  
Brackets, 235

## C

Calculus, defined, 149  
    formulas, 172, 189, 308  
    integral, 191–206

Calculus, symbols, 150  
 Cancellation, 5  
 Capacity, 12, 23, 239  
     reactance, 35, 240  
 Characteristics, diode vacuum tube,  
     105, 157  
 Circle equation, 139, 140  
 Circuit, parallel, 127  
 Circular angle, 70, 139, 140  
 Circular angle construction, 70, 141  
 Circular function, 144  
     identities, 147, 306  
 Circular radian, 140, 143  
 Circumference, 238  
 Common logarithms, 17, 180  
 Communication systems, 1  
 Comparison test, for convergence or  
     divergence, 208  
 Complex fractions, 8  
 Complex notation, 92  
 Complex quantities, 90–99, 303  
     defined, 90  
     notation, 90  
 Components of vector, 59  
 Compound interest, 175  
 Conjugate, complex numbers, 98  
 Constant, integral of, 199  
     of integration, 197  
     table of useful, 299  
 Convergent series, 207  
 Conversion, between natural and  
     common logarithms, 180, 189  
     table, 243  
     of units, 12  
 Coordinates, polar, 90, 96, 106, 108  
     rectangular, 59, 90, 100  
     signs used for, 239  
 Cosecant, defined, 69  
 Cosine, defined, 69  
     integral of, 204  
     series, 96, 211, 310  
 Cotangent, defined, 69  
 Covered sine, 237  
 Cross-section paper, 100, 101, 107  
 Cube, 10  
 Curve, 100, 102  
     defined, 100  
     labeling, 106

Curve, plotting, 105  
     of sine and cosine integrals, 294  
     square law, 157  
     variable slope, 156  
 Curves and graphs, 100–109

## D

Decimal fractions, 8  
 Decimal point, 9  
 Decimal slide rule, 29  
 Denominator, 6  
     least common, 7  
 Dependent equations, defined, 124  
 Dependent variable, 157  
 Derivative, basic method, 159  
     of constant, 157  
     of  $\cos \theta$ , 183  
     of  $\cosh \theta$ , 186  
     of curve, 155  
     of exponential functions, 178, 179  
     of natural logarithm, 181  
     partial, 187, 188, 190  
     of product, 163  
     of quotient, 163  
     of  $\sin \theta$ , 181  
     of  $\sinh \theta$ , 185  
     successive, 165, 184  
     of sum, 162  
     of  $\tan \theta$ , 184  
     of  $\tanh \theta$ , 187  
     total, 188  
     the variable, 158  
         with constant exponent, 159  
         multiplied by constant, 158  
     of  $x^n$ , 161  
 Determinant, 111  
     elements, 117  
     of higher order, 123  
     of principal diagonal, 117  
     of second order, 116  
     of third order, 120  
 Differential calculus, 149–190  
     treating algebraic functions, 149–  
         173  
     treating transcendental functions,  
         174–190  
 Differential sign, defined, 150

Differentiation, partial, 204  
 Direction, vector, 54  
 Discriminant, 133  
 Divergent series, 208  
 Dividend, 2  
 Division, 2, 5  
     complex numbers, 93  
     fractions, 8, 42  
     law of exponents, 11  
     rules, 5  
     using logarithms, 22  
     using slide rule, 26  
     of vectors, 93  
 Divisor, 2  
 Double integrals, 205

## E

Electric wave filters, 139  
 Equal roots, 133  
 Equality, 36  
 Equations, addition, 36  
     canceling terms, 45  
     changing signs, 45  
     containing decimals or fractions, 42-43  
     dependent, 115  
     division, 42  
     exponentials, 46, 96  
     fractional, 35  
     illustration of rules, 47  
     inconsistent, 115, 124  
     independent, 115  
     linear, 1, 110, 115, 118  
         defined, 123  
         sets of three, 118  
         sets of two, 110  
     multiplication, 36  
     quadratic, 127-138  
         completing the square, 129  
         defined, 127, 137  
         factoring method, 128  
         formula, 130, 131  
         general form, 132  
         graphical method, 128, 129  
         higher powered, 136  
         pure quadratic, 127  
         simplest form, 127

Equations, rules for solving, 45  
     simultaneous, 110-126  
         classification, 115  
         defined, 123  
         dependent, 115, 116  
         determinant method, 116, 117, 120, 122  
         graphical method, 111, 125  
         inconsistent, 115, 116  
         independent, 115, 116  
         multiplication-addition method, 112, 119, 125  
         substitution method, 113, 119, 125  
     solution, 45  
     subtraction, 36  
 Euler's constant, 216  
 Evaluation, 46  
 Exercise answers, 327  
 Exponential, applied to circular function, 146  
     applied to hyperbolic function, 146  
     geometrical interpretation, 145  
 Exponential formulas, 307  
 Exponential series, 96, 176, 310  
 Exponents, 10, 17  
     addition, 10  
     defined, 10  
     fractional, 13  
     inverted, 13  
     law of, 10  
     multiplication, 11  
     negative, 10  
     positive, 10  
     power, 11  
     subtraction, 11  
     zero, 10  
 Expression, algebraic, 35, 137  
     defined, 137

## F

Factorial, defined, 97, 235  
     table, 299  
 Factoring, 44  
 Farad, 12-13, 239  
 Figures, significant, 23  
 Finite increment, 151

Finite series, 207  
 Formulas, algebraic, 300  
     miscellaneous, 300  
     calculus, 172, 189, 308  
     exponential, 307  
     hyperbolic, 307  
     logarithmic, 303  
     trigonometric, 306  
 Fourier series (*see* Series, Fourier)  
 Fractions, 6  
     addition and subtraction, 7  
     complex, 8  
     decimal, 8–9  
     defined, 6  
     denominator, 6  
     division, 7  
     equivalent, 6  
     improper, 6  
     inverted, 8  
     mixed numbers, 6  
     multiplication, 7  
     numerator, 6  
     proper, 6  
     reduction to L.C.D., 7  
     sign of, 8  
 Frequency, resonant, 39  
 Functions, 157  
     Bessel, 217, 255–258, 310  
         first kind  $n$  order, 217  
         first kind zero order, 217  
         table of, 259–293  
     circular, 144  
     cosine, 69, 219  
     cosine integral, 216  
         curve, 294  
         tables, 295–298  
     exponential, series, 176, 211, 310  
         table in terms of decibels, 252  
         table in terms of nepers, 249  
     hyperbolic, 144  
         table, 249, 252  
     logarithmic, 18, 180  
         table, 244, 245  
     periodic, 218  
     sine, 69, 218  
     sine integral, 216  
         curve, 294  
         tables, 295–298

Functions, transcendental, defined, 149  
     trigonometric, of angles, 66, 70, 71  
         complex numbers, 94  
         computation, 73  
         cosecant, 69  
         cosine, 69  
         cotangent, 69  
         inverse, 75  
         secant, 69  
         sine, 69  
         table of, 244  
         tangent, 69  
     of  $x$ , 236

## G

Geometric addition, 54, 55  
 Geometry, 54–65  
 Graph paper (*see* Paper)  
 Graphical numbers, 3  
 Graphical representation, 3, 90  
 Graphs, 100–109  
     defined, 100  
     labeling, 106  
     linear equations, 111  
     plotting, 100–108  
     scale selection, 104  
     slope, 104  
     solving problems by, 111, 128  
 Greek alphabet, 233

## H

Henry, 13, 239  
 Higher powers, by logarithms, 22  
 Horizontal components of vector, 59  
 Hyperbola, curve, 140, 141  
     equation, 139, 140  
 Hyperbolic angle, 139, 140  
     construction of, 141  
 Hyperbolic cosine, 142  
 Hyperbolic formulas, 307  
 Hyperbolic functions, 144  
     identities, 146, 147, 307  
     table in terms of decibels, 252–254  
     table in terms of nepers, 249–251  
 Hyperbolic radian, 140, 143

Hyperbolic sine, 142  
 Hyperbolic tangent, 142  
 Hyperbolic trigonometry, 139–148  
 Hypotenuse of right triangle, 56  
 Hysteresis (or *B-H* curve), 102, 103, 322

I

Identities, circular and hyperbolic, 306, 307  
     circular function, 147, 306  
     hyperbolic function, 147, 307  
     trigonometric, 305, 306  
 Imaginary numbers, 235  
     representation of, 90  
 Impedance, 38  
 Impedance vector, 92  
 Improper fraction, 6  
 Inconsistent equations, 115, 124  
 Incremental sign, 151  
 Independent equation, defined, 124  
 Independent variable, 157  
 Infinite series, 207, 310  
 Infinitesimal increment, 151  
 Infinitesimals, 151, 196  
 Index, initial, on slide rule, 30  
 Inductance, 13  
 Inductive reactance, 35, 92  
 Inflection point, 170  
 Integrals, 308, 309  
     algebraic, 198, 308  
     of algebraic sum, 202  
     calculus, 191–206  
         defined, 191  
     of constant, 199  
     of cosine, 204  
     multiple, 204  
     of natural logarithm, 203  
     of one, 198  
     sign, 191, 236  
         defined, 150  
     of sine, 203  
     of tangent, 204  
     transcendental, 203, 308  
     triple, 205  
     of variable, 201  
     of zero, 198

Integration, partial, 204  
     by parts, 202  
     volume, 205  
 Interest, simple, 174  
 Interior angle, of triangle, 74  
 Interpolation, 23  
 Inverse trigonometric functions, 75  
 Irrational numbers, 2

J

*j*, operator, 90

K

Kilohm, 13, 240  
 Kilovolt, 13, 240  
 Kilowatt, 13, 240

L

Law, of natural decay, 178  
     of natural growth, 174  
 Least common denominator, 7, 237  
 Less than, sign, 234  
 Limits, 150  
 Linear equation, 1, 110  
     any number of, 122  
     defined, 123  
     sets of three, 118  
     sets of two, 110  
 Logarithm, 17–34  
     base of, 17, 97, 180, 236  
     characteristics for, 18  
         rules for, 19  
     cologarithm, 236  
     common system, 17  
     defined, 17  
     division by, 22  
     extracting roots by, 23  
     fractional exponents, 19  
     graphical, paper, 103, 109, 322  
         slide rule, 25  
     interpolation, 23  
     mantissa, defined, 18  
         rules, 19  
     multiplication by, 20  
     napierian, 236  
     natural, 97, 180, 236  
         table of, 245–248  
     of numbers from 1 to 100, 244

Logarithm, raising to power by, 22  
 table, 20, 244  
 use of, 20  
 of trigonometric function, 75  
*See also* Antilogarithm, 21, 236  
 Logarithmic formulas, 303  
 Logarithmic graph paper, 103, 322  
 Logarithmic rate, 174

## M

Maclaurin's series, 212, 311  
 Magnitude, 54, 79  
   signless numbers, 1  
   of vector, 79  
 Mantissa, of logarithms, 18  
   rules, 19  
 Mathematical polar form, 96  
 Maxima, 167  
 Maximum load power, 168  
 Mega, units, 13, 243  
 Megohm, 13, 240  
 Mho, conductance, 238  
 Microfarad, 12, 239  
 Microhenry, 13, 239  
 Micromicrofarad, 12, 239  
 Micromicrohenry, 13, 239  
 Micromicro units, 12-13, 243  
 Micro units, 12, 243  
 Milli units, 12-13, 243  
 Minima, 167  
 Minuend, 4  
 Mixed number, 6  
 Multiple integrals, 204  
 Multiplication, 5  
   complex numbers, 93, 97  
   of exponents, 11  
   of fractions, 7  
   law of exponents, 10  
   by logarithms, 20-21  
   rules, 5  
   of vectors, 93

## N

Napierian, logarithms, 236  
 Natural logarithms, 180, 236  
   integral of, 203

Natural number  $e$ , 176  
 Negative angle symbol, 84, 234  
 Negative exponents, 10  
 Networks, attenuation, 139  
 Notation, polar coordinates, 108  
   rectangular coordinates, 100-102

 Numerator, 6

## O

Ohm's law, 1, 35, 46, 47  
 Operator  $j$  (or  $i$ ), 90, 91, 235  
 Origin, 101

## P

Paper, cross section, 100, 101, 107  
   linear graph, 107  
   logarithmic, 322  
   polar graph, 106  
   semilogarithmic graph, 103  
 Parallel circuit, 127  
 Parallelogram law, 57  
 Parenthesis, 235  
   removal of, 43  
 Partial derivatives, 187  
 Partial differentiation, 204  
 Partial integration, 204  
 Plot, 100  
 Polar coordinates, 106, 108

Polar coordinates, engineering form,  
80, 90  
mathematical form, 96  
paper, 106  
reference line, 106, 108  
reference point, 108  
systems, 106, 108  
vector, 90  
Polar form, 90, 95  
of vector, 93  
Positive exponents, 10  
Power, decimal, 17  
exponent, 10  
of fraction, 11  
higher, 22  
of product, 11  
series, 211, 310  
Product, 5  
algebra, 38  
Proportional parts, 24, 67  
Protractor, 57  
Pulse, short rectangular, 229, 315  
thin line, 230

Q

Quadrants, 62  
of circle, 61, 62  
Quadratic equation, 127-138  
completing the square, 129  
defined, 127, 137  
discriminant, 133  
factoring method, 128  
formula, 130, 131  
general form, 132  
graphic method, 128  
graphical solution, 129  
higher powered, 136  
pure quadratic, 127  
simplest form, 127  
Quantity, 40  
defined, 137  
Quotient, 2

R

Radian, 234  
circular, 140, 143  
hyperbolic, 140, 143  
Radical, 13, 235

Radical, extracting square root, 1  
simplification, 14  
Radicand, 13, 235  
Rates, 153  
Ratio, test for convergence or  
vergence, 210  
trigonometric, 67  
Rational numbers, 2  
Rationalized complex numbers,  
303  
Reactance, capacitive, 35, 92  
inductive, 35, 92  
Real numbers, 2, 3  
Reciprocal, 8, 43  
Rectangular coordinates, 59, 90,  
origin, 101  
signs, 102  
 $x$ -axis, 101  
 $y$ -axis, 101  
Rectangular forms, 95  
Reference line, 108  
Reference point, 108

Triple integrals, 205

## U

Unequal sign, 44, 234

## V

Variable, 36

Variable-slope curve, 156

Vector, 54

addition of, 58, 76-89

analysis, 76-89

complex notation, 90

components of, 59

defined, 54

diagram, 83-87

direction, 54

division, 93, 98

in polar form, 93

in rectangular form, 98

Vector, expressed in complex notation, 92  
 horizontal component of, 59  
 magnitude, 54  
 multiplication of, 93, 97  
   in polar form, 93  
   in rectangular form, 97  
 notation, 81  
 quadrants, 61, 92  
 resolution, 59  
 sense of, 54  
 vertical component of, 59  
 Vectorial addition, 76-89  
 Vectorial component of vector, 59  
 Velocity, 165  
 Vinculum, 235  
 Volume integration, 205

## W

Wave forms, 207  
   fractional cosine pulse wave, 316  
   full-wave rectified pulse wave, 314  
   half-wave rectified pulse wave, 313  
   negative scanning wave, 313  
   positive scanning wave, 313  
   rectangular pulse wave, 229, 315  
   sawtooth cosine wave, 312  
   sawtooth sine wave, 312

Wave forms, scanning wave with  $\beta$  flyback time, 314  
   square cosine wave, 221, 224, 312  
   square sine wave, 221, 224, 311  
   symmetrical triangular pulse wave, 315  
   unsymmetrical sawtooth wave, 314  
 Waves, square cosine, 221  
   square sine, 221  
   traveling, 139  
 Whole numbers, 2

## X

X-axis or  $x$ -axis, 59, 91, 101, 239

## Y

Y-axis or  $y$ -axis, 59, 91, 101, 239

## Z

Z-axis or  $z$ -axis, 239  
 Zero, 2  
   as exponent, 10  
   figure, 3  
   integral of, 198  
 Zero power, 10

# ANSWERS TO EXERCISES

## Chapter 1

## Chapter 3

- |   |   |
|---|---|
| 1. $y = a - b - z$<br>$b = a - x - y$                                     | 8. $T = \frac{X(R - S)}{O + P}$<br>$S = \frac{RX - T(O + P)}{X}$                |
| 2. $b = \frac{R - ax + cz}{y}$<br>$z = \frac{-R + ax + by}{c}$            | 9. $T = \sqrt[3]{(X + Y)(R - SP)}$<br>$P = \frac{R(X + Y) - T^3}{S(X + Y)}$     |
| 3. $S = \frac{XY - JQ}{RT}$<br>$Q = \frac{XY - RST}{J}$                   | 10. $a = -b + x^2y^4 + 2xy^2z + z^3$<br>$y = \sqrt{\frac{\sqrt{a + b} - z}{x}}$ |
| 4. $z = \frac{xy}{ab}$<br>$y = \frac{abz}{x}$                             | 11. $R = \frac{E - IJX}{I}$   |
| 5. $x = z(a + bz) - y$<br>$b = \frac{x + y - az}{z^2}$                    | 12. $C = \frac{C_1C_2}{C_1 + C_2}$<br>$C_1 = \frac{CC_2}{C_2 - C}$              |
| 6. $y = \frac{axz + cx - z}{az + c}$<br>$a = \frac{cx - cy - z}{yz - xz}$ | 13. $a = \frac{a^2n^2 - 10bL}{9L}$<br>$n = \sqrt{\frac{L(9a + 10b)}{a^3}}$      |
| 7. $M = \frac{NPQ + X + Y}{PQ}$<br>$Y = PQ(M - N) - X$                    | 14. $t = \frac{N}{e \times 10^8}$   |

$$I = \sqrt{\frac{4.187W}{Rt}}$$

$$r = \frac{2\pi m}{F}$$

$$H = \frac{4\pi^2 I}{T^2 m}$$

$$18. L_1 = \frac{M^2}{K^2 L_2}$$

$$19. t = \frac{R_i - R_o}{a R_o}$$

$$20. C = \frac{\lambda^2}{(1,884)^2 L}$$

#### Chapter 4

(a) 50

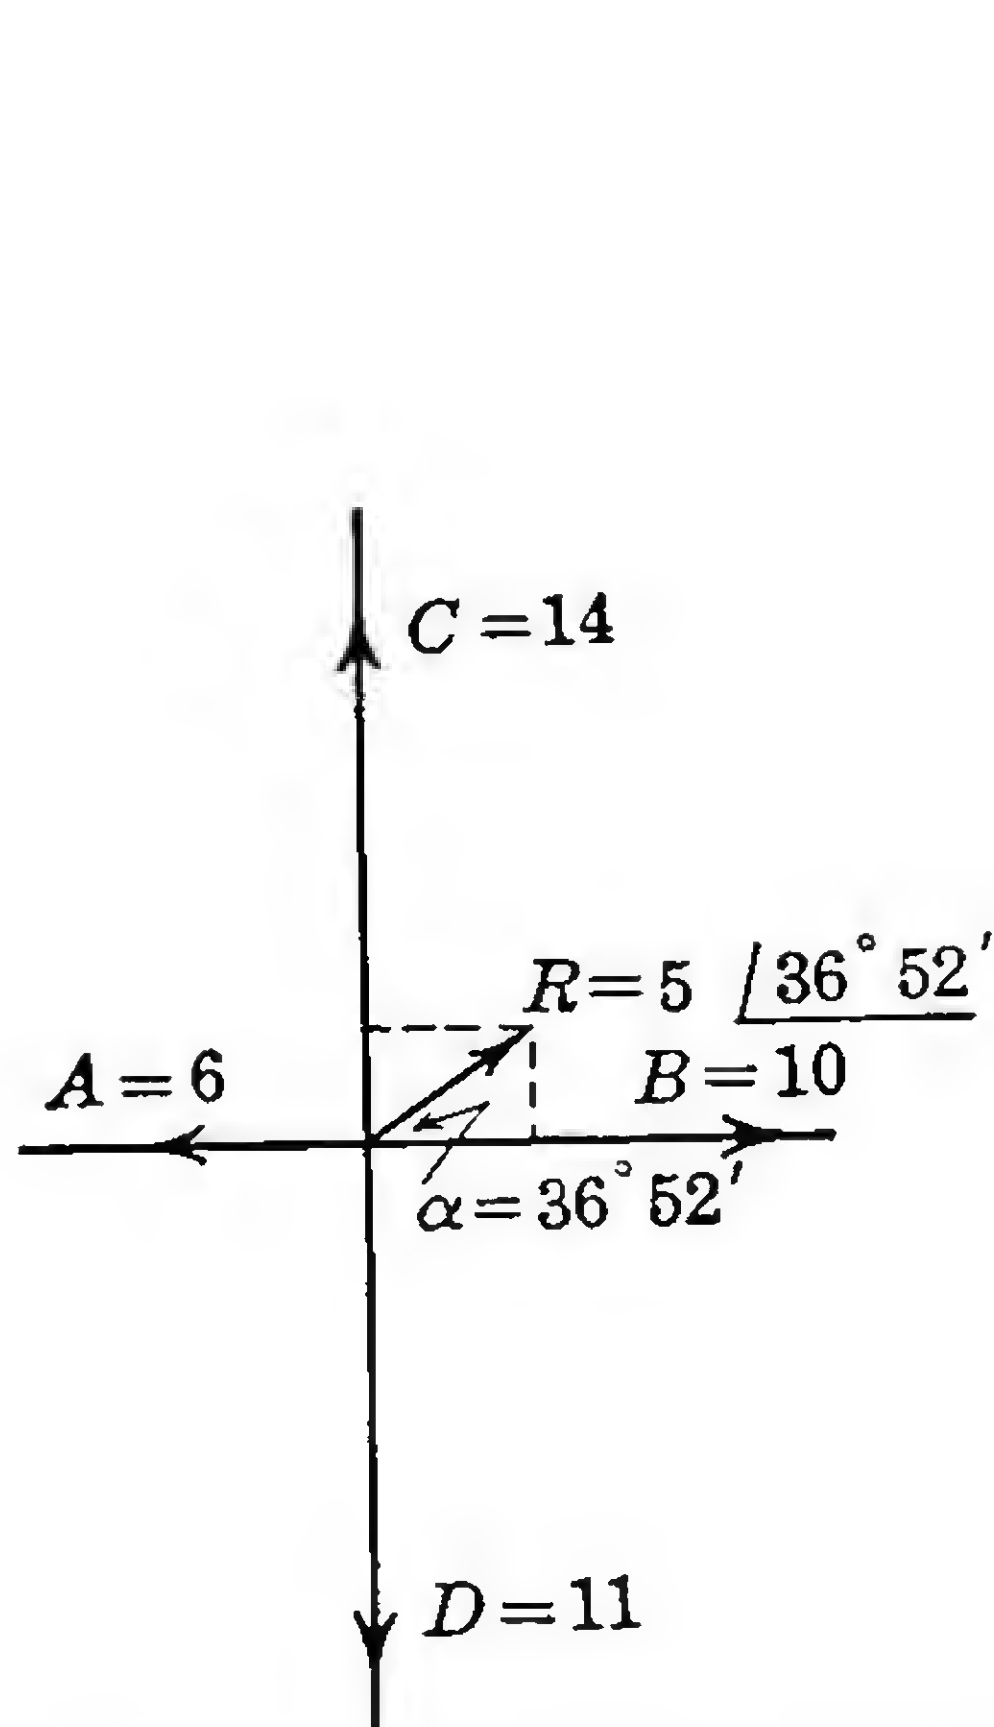

(b) 10

(c) 5

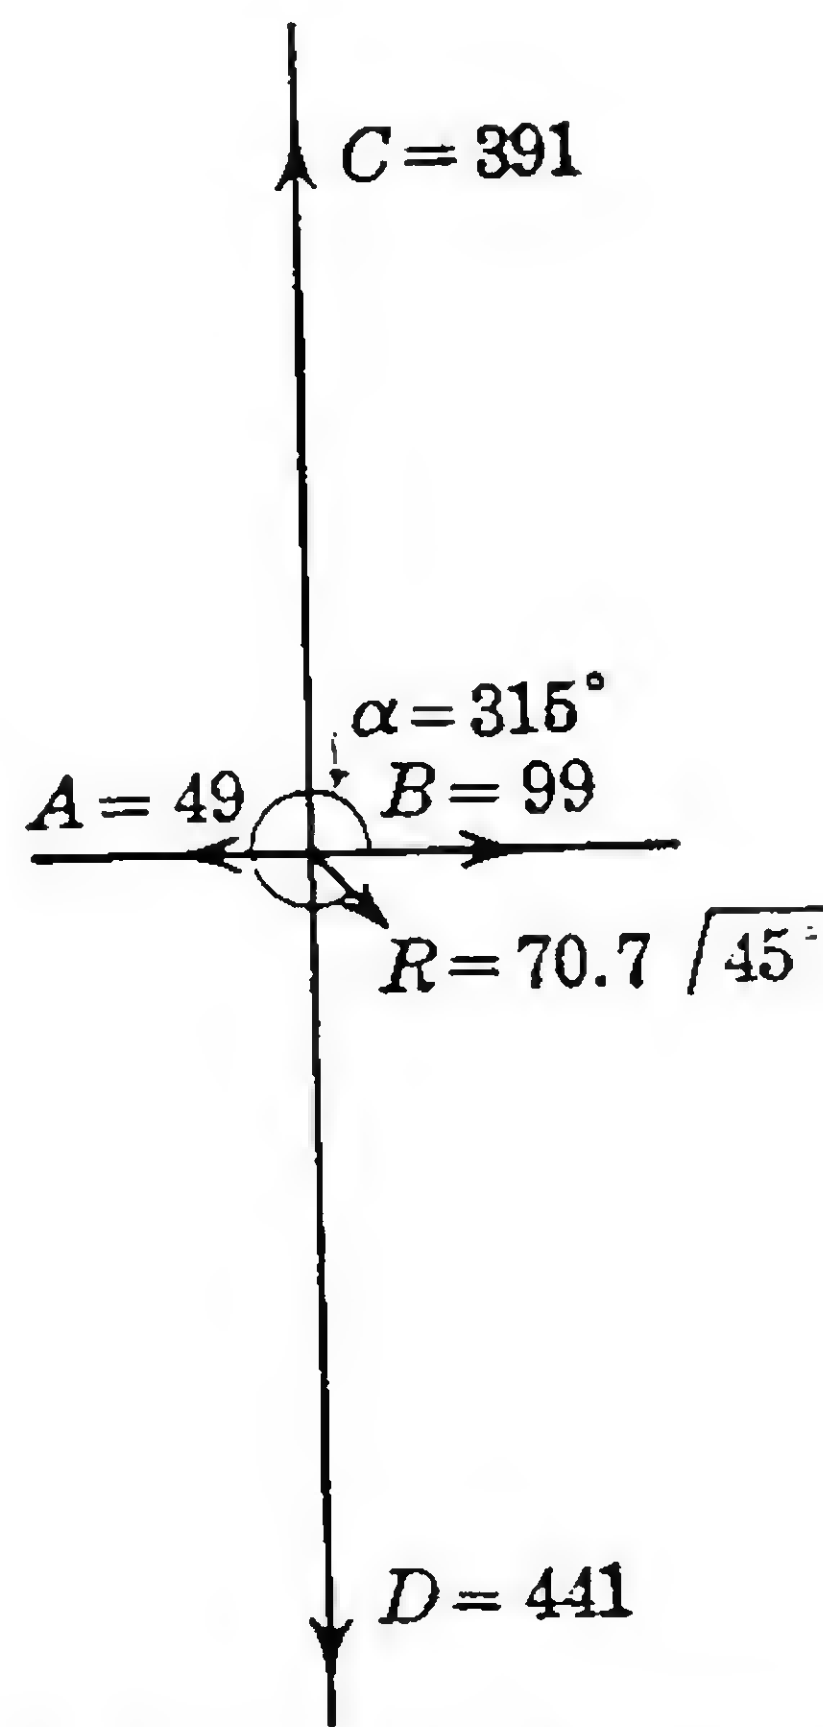

(d) 24

(e) 1.0955

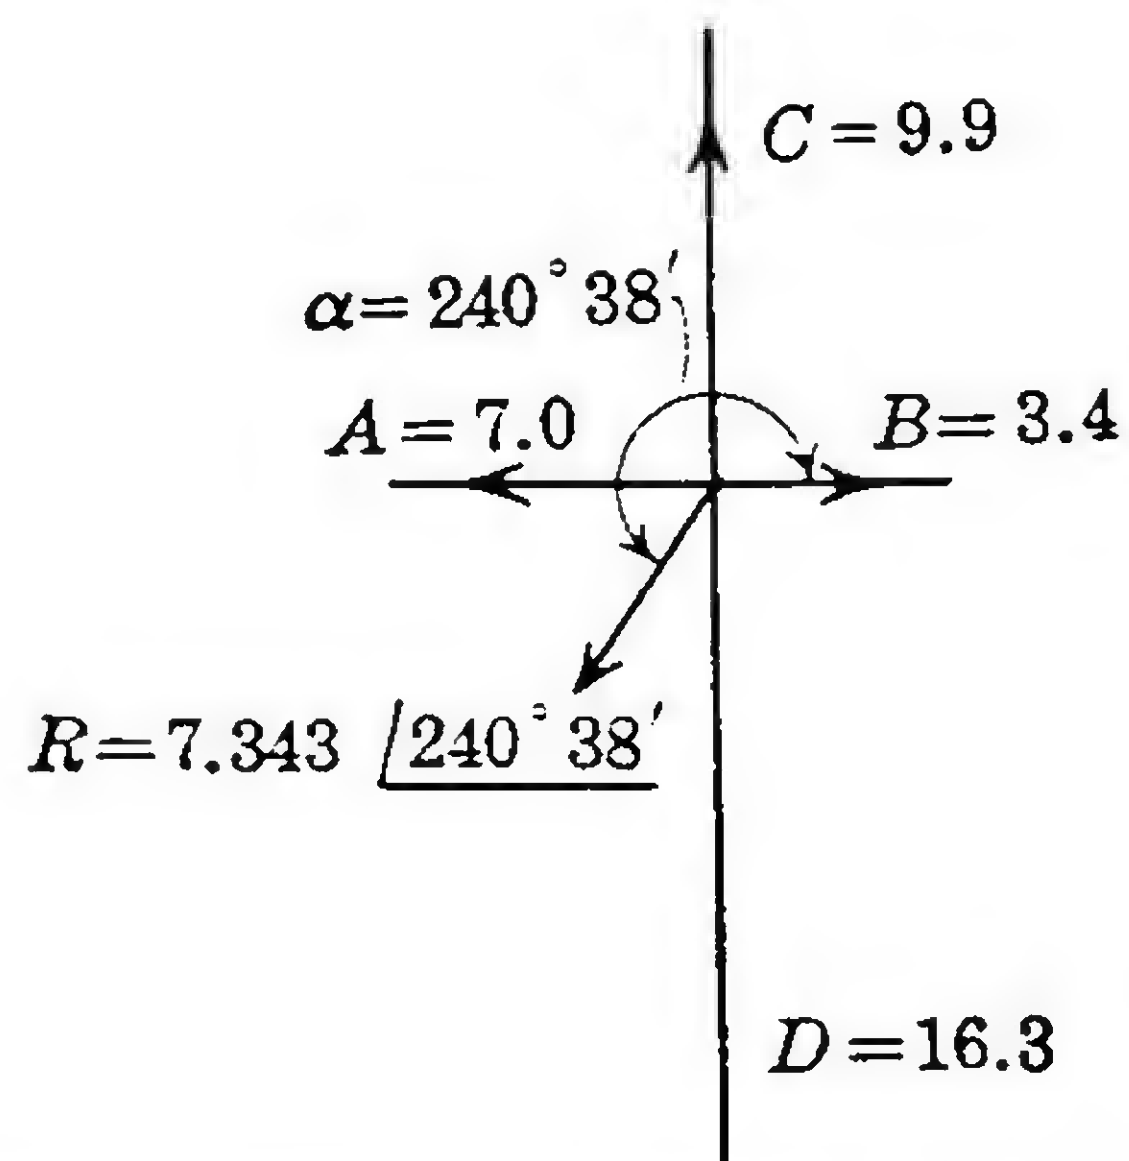

(f) 500

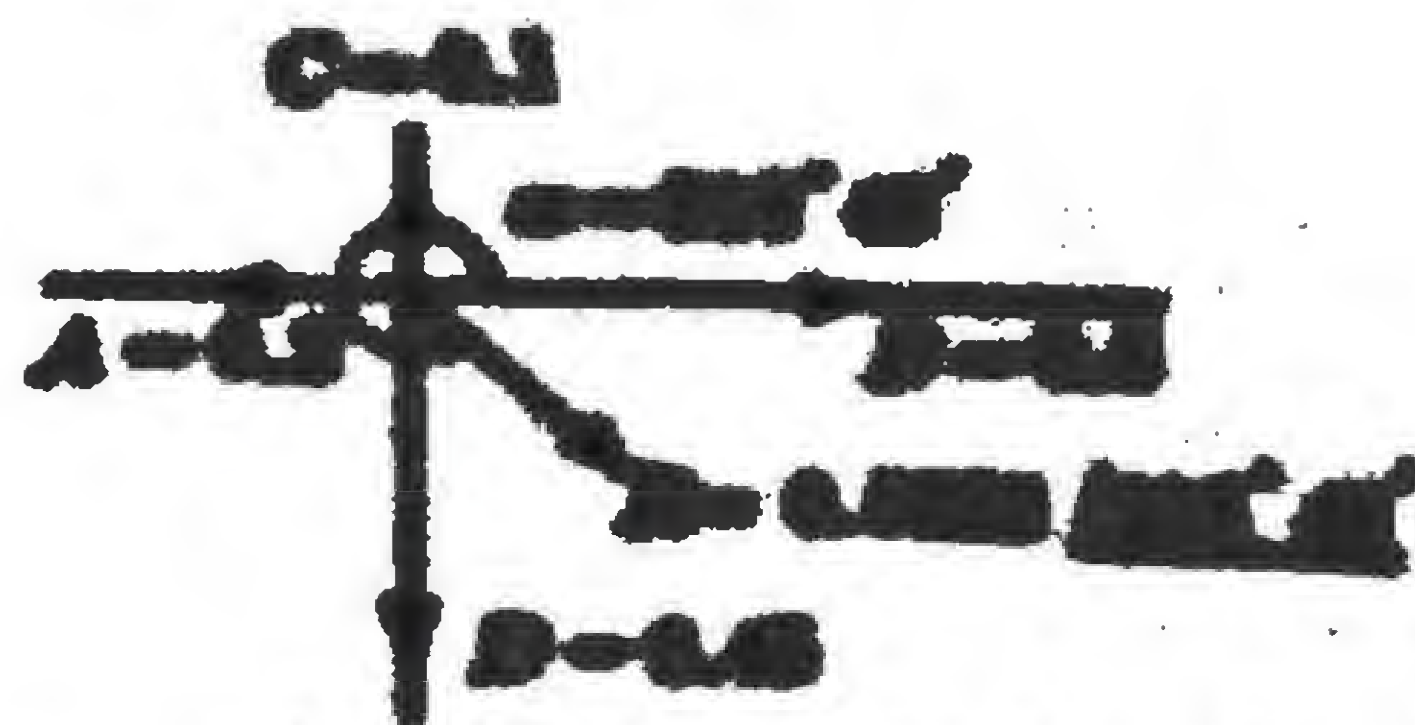

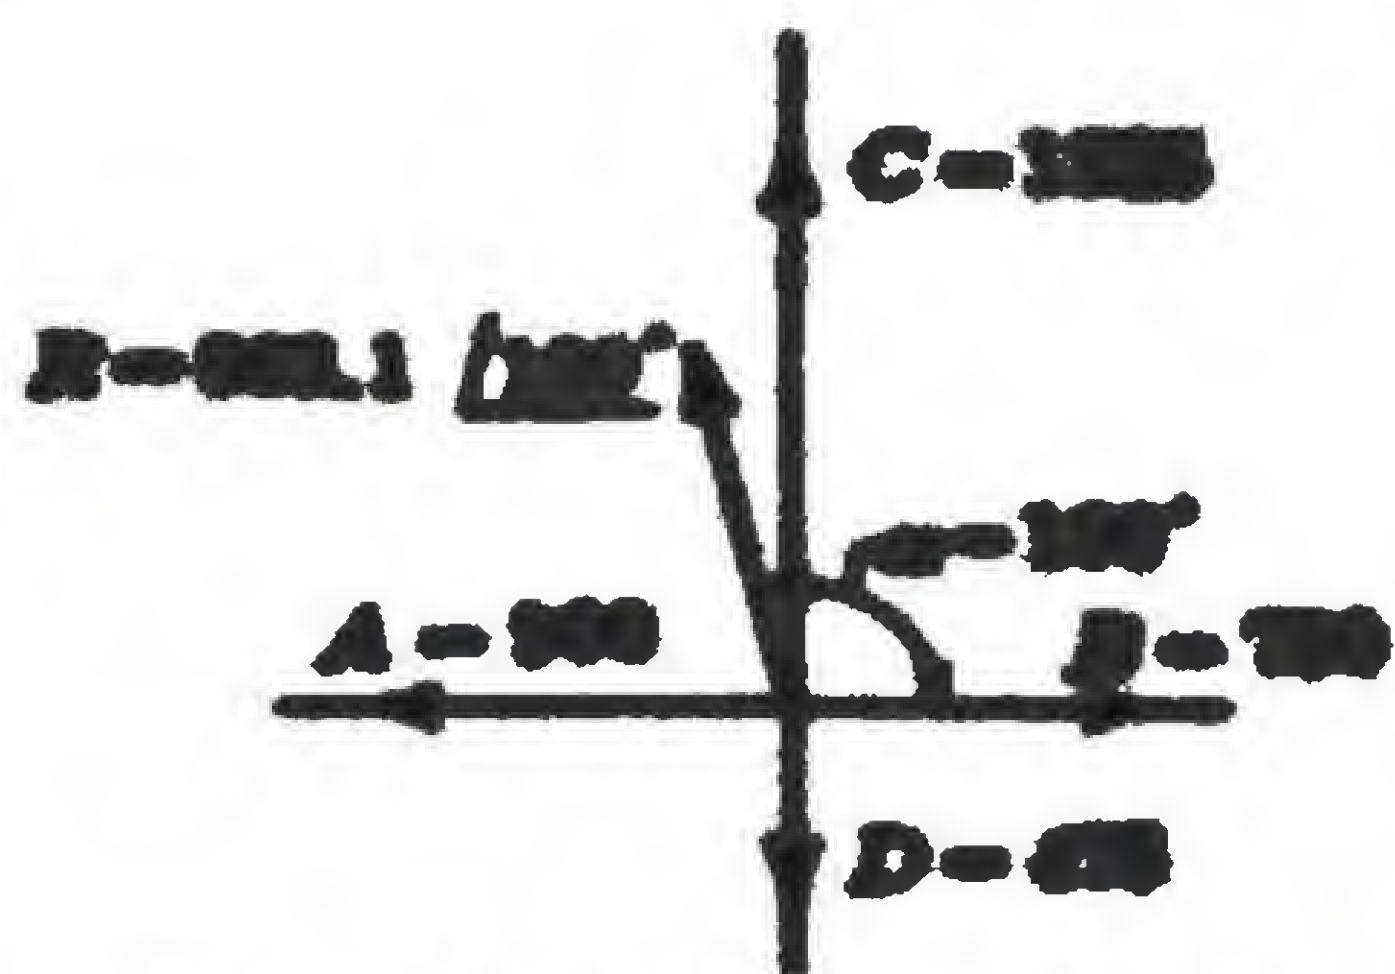

(a) Resultant in first quadrant  
( $\alpha = 36^\circ 52' = 36^\circ.87$ )

2. (b) Resultant in fourth quadrant

2. (c) Resultant in third quadrant ( $\alpha = 240^\circ 38' = 240^\circ.64$ )

2. (d) Resultant in second quadrant

2. (e) Resultant in fourth quadrant  
( $\theta = 360^\circ - 100^\circ = 260^\circ$ )

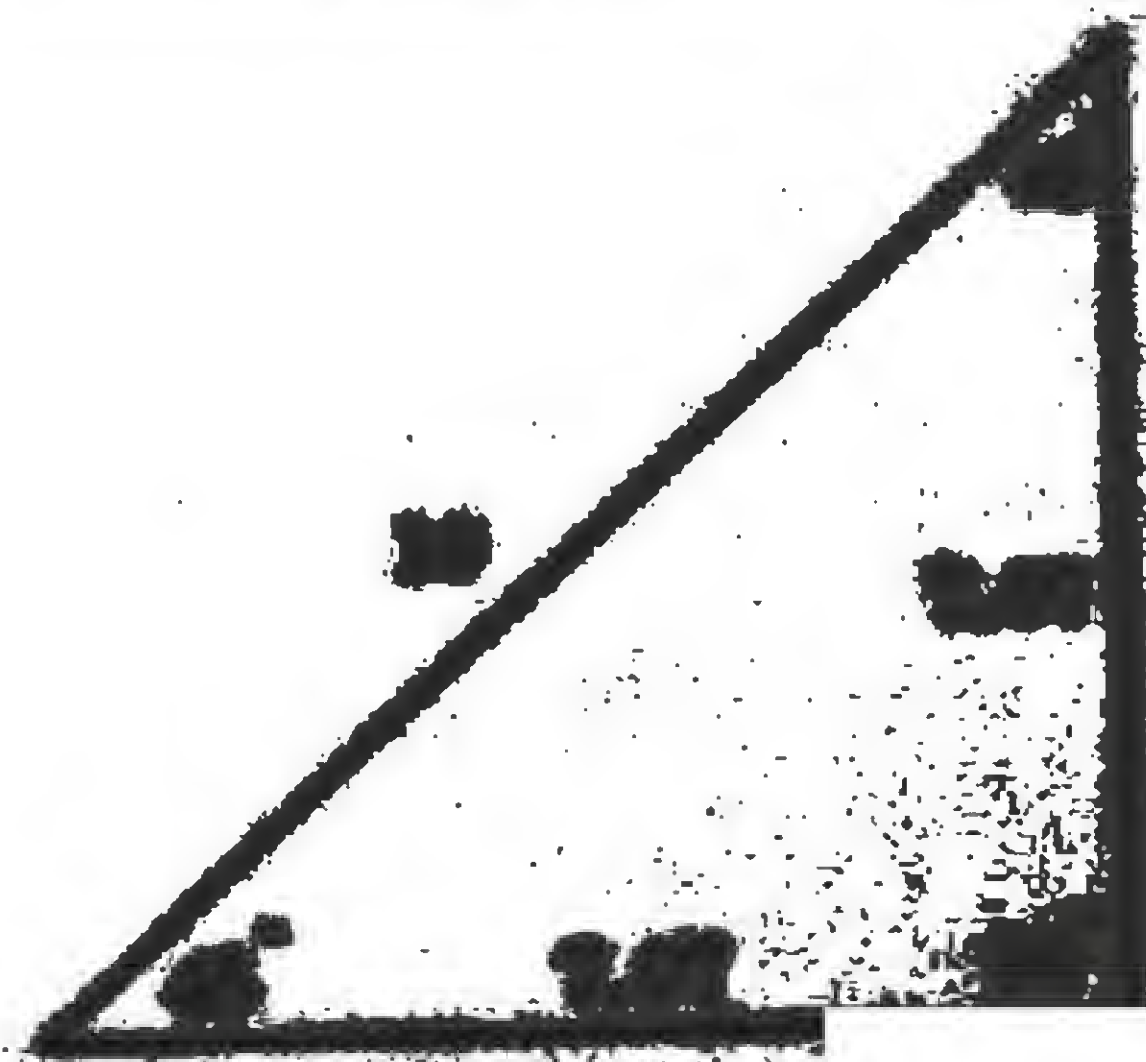

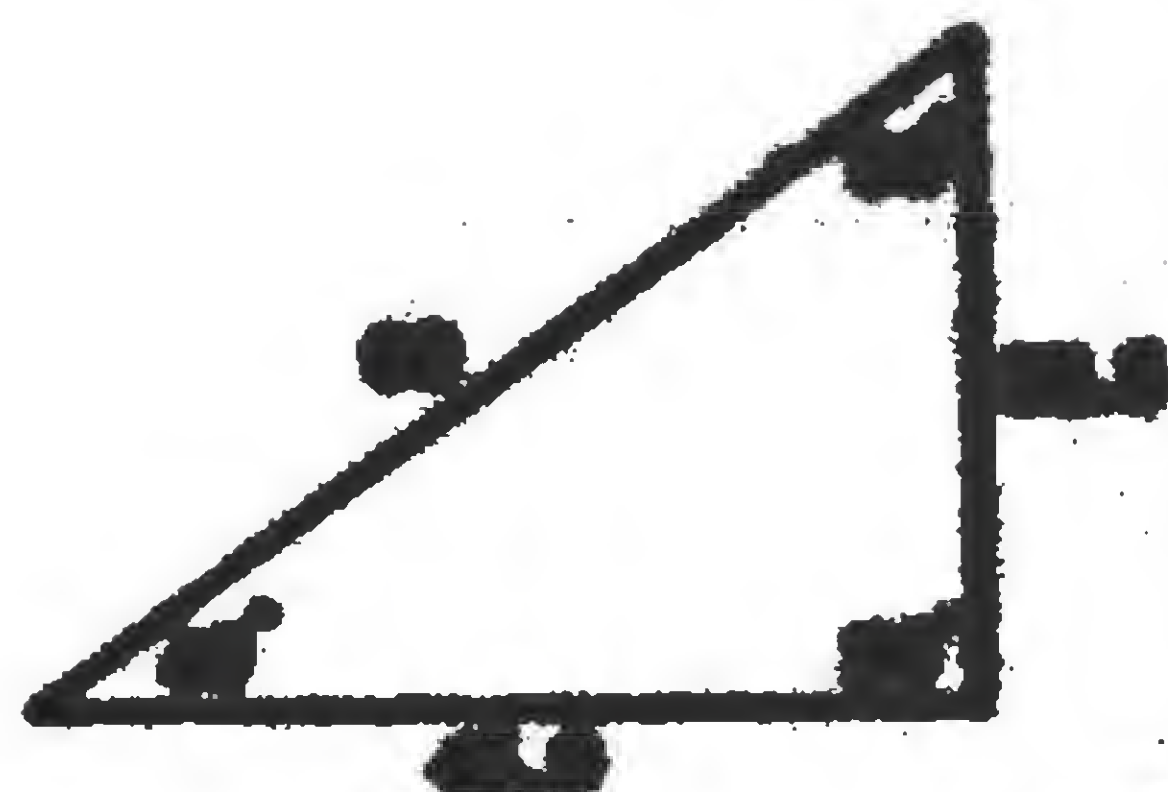

2. a. Resultant vector length = 100.1
- b. Resultant vector length = 100.1
- c. Resultant vector length = 4.38
- d. Resultant vector length = 5
- e. Resultant vector length = 200.2
- f. Resultant vector length = 200.2

### Chapter 8

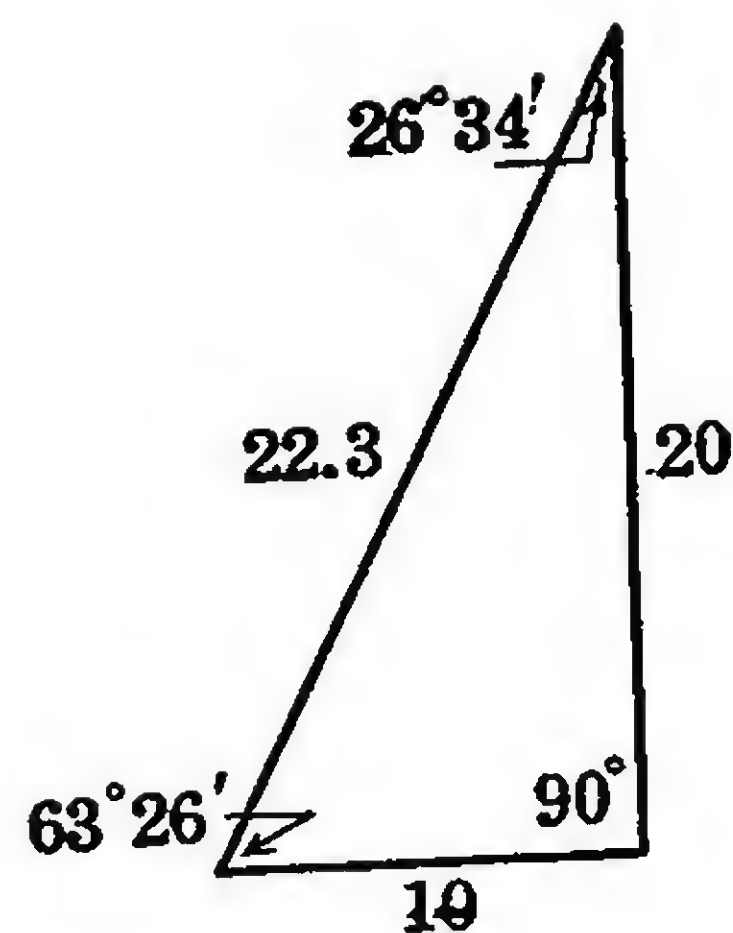

$$\begin{aligned}
 1. \sin 40^\circ &= Y/R \\
 0.64279 &= Y/60 \\
 Y &= 60 \times 0.64279 = 38.57 \\
 \cos 40^\circ &= X/R \\
 0.76604 &= X/60 \\
 X &= 60 \times 0.76604 \\
 X &= 45.96
 \end{aligned}$$

$$\begin{aligned}
 2. \sin 25^\circ &= Y/R \\
 0.42262 &= 35/R \\
 R &= 35/0.42262 = 82.8 \\
 \cos 25^\circ &= X/R \\
 0.90631 &= X/82.8 \\
 X &= (82.8)(0.90631) \\
 X &= 75
 \end{aligned}$$

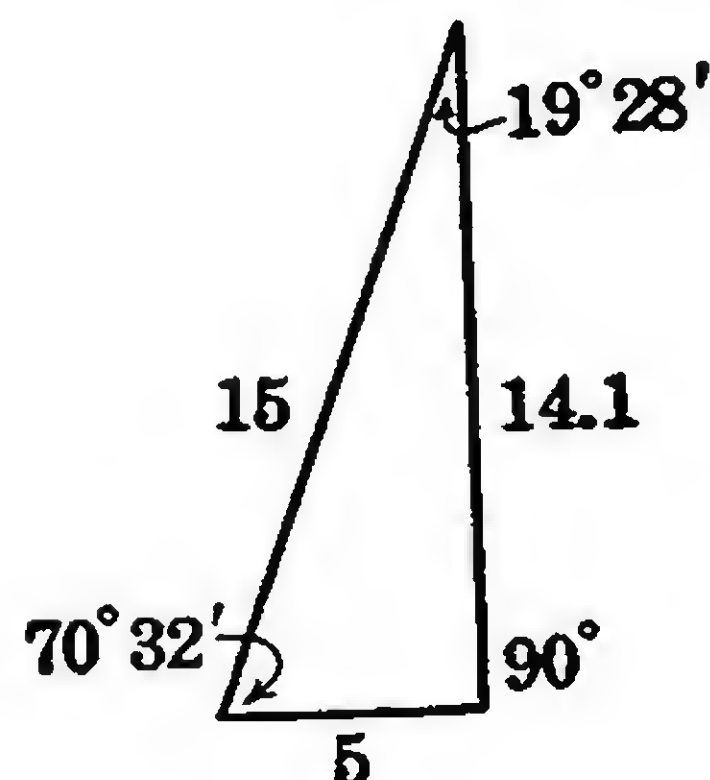

$$\begin{aligned}
 3. \sin 45^\circ &= Y/R \\
 0.70711 &= 7.07/R \\
 0.70711R &= 7.07 \\
 R &= 10 \\
 \cos 45^\circ &= X/R \\
 R &= 10 \\
 \sin 45^\circ &= Y/R \\
 0.70711 &= Y/10 \\
 7.0711 &= Y
 \end{aligned}$$

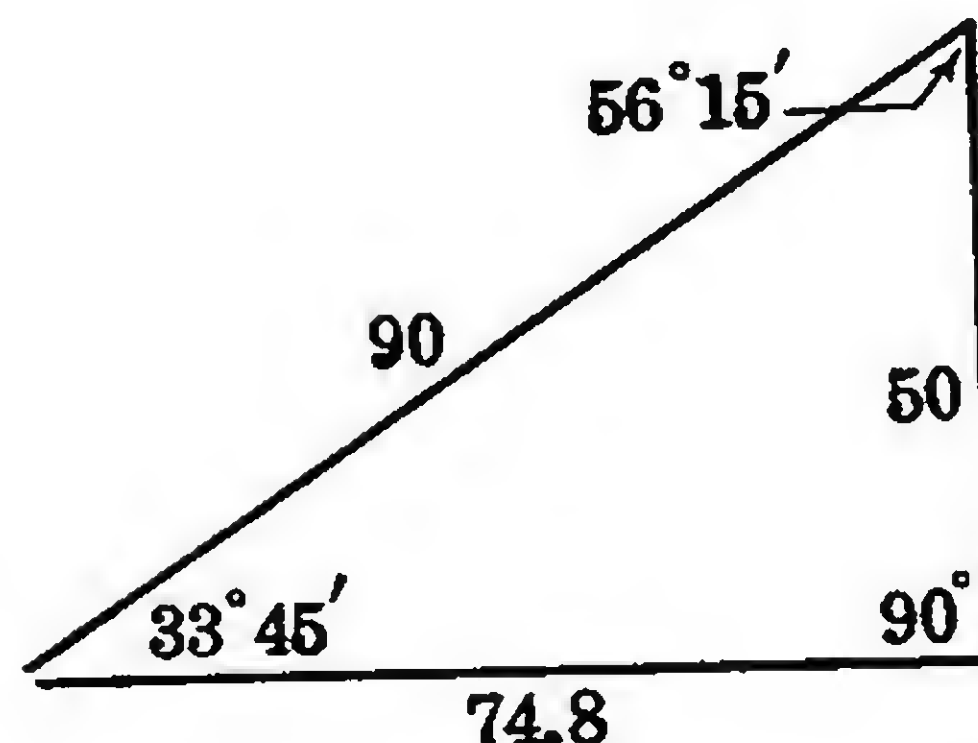

$$\begin{aligned}
 \tan \theta &= Y/X \\
 \tan \theta &= 20/10 = 2 \\
 \theta &= 63^\circ 26' = 63.43 \\
 \sin 63^\circ 26' &= Y/R \\
 0.89441 &= 20/R \\
 0.89441R &= 20 \\
 R &= 22.3 \\
 26^\circ 34' &= 26.57
 \end{aligned}$$

$$\begin{aligned}
 5. \cos \theta &= X/R \\
 \cos \theta &= 5/15 \\
 \cos \theta &= 0.33333 \\
 \theta &= 70^\circ 32' = 70.53 = Y/R \\
 0.94284 &= Y/15 \\
 Y &= 14.1 \\
 19^\circ 34' &= 19.47
 \end{aligned}$$

$$\begin{aligned}
 6. \sin \theta &= Y/R \\
 \sin \theta &= 50/90 \\
 \theta &= 33^\circ 45' = 33.75 \\
 \cos 33^\circ 45' &= X/R \\
 0.83147 &= X/90 \\
 X &= 74.8 \\
 56^\circ 15' &= 56.25
 \end{aligned}$$

## Chapter 6

The student should draw the vector diagrams, which have been omitted here.

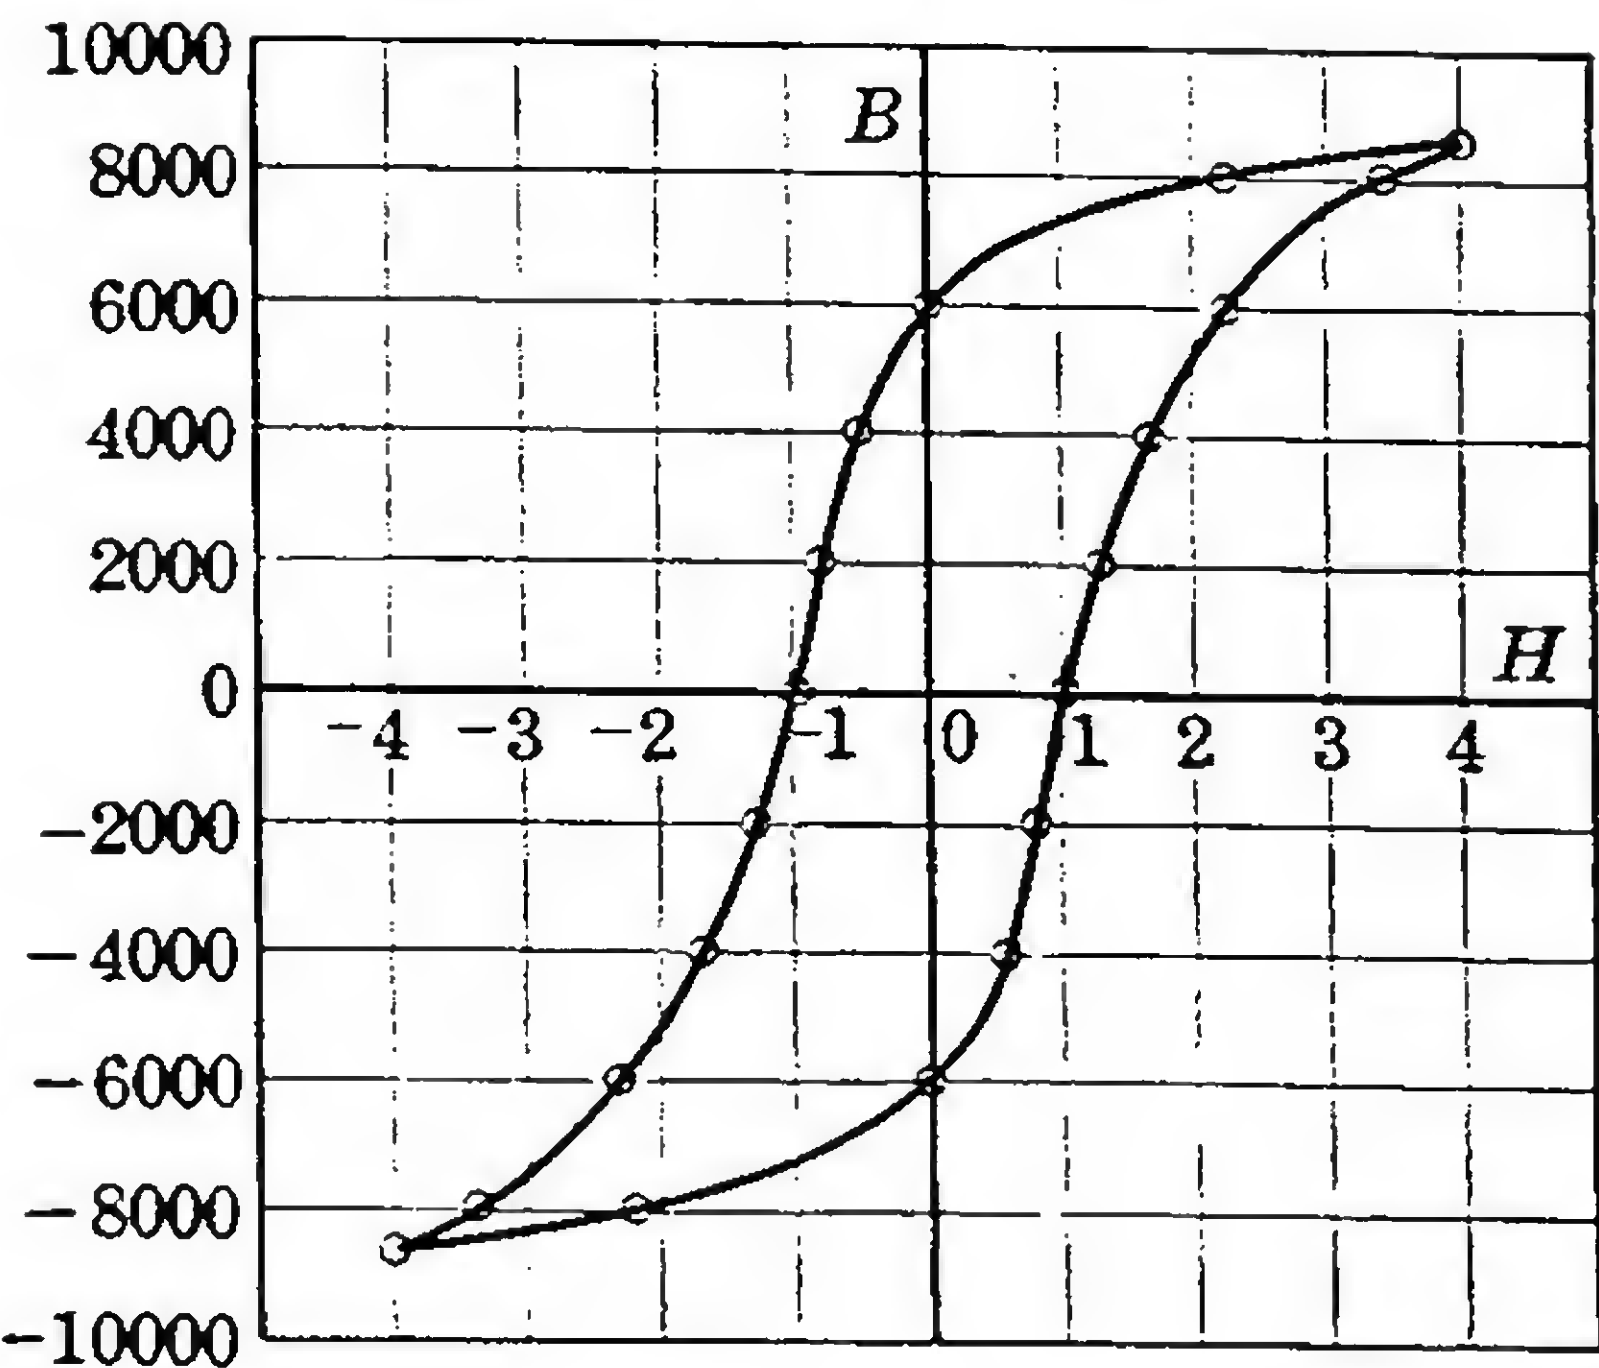

1.  $V_R = 178.4/38.47$
2.  $Z_R = 134.9/22.35$
3.  $I_R = 5.205/264.95$
4.  $V_R = 86.6/90^\circ$
5.  $F_R = 6.229/132.40$

6.  $c = 5$
7.  $c = 7.07$
8.  $c = 17.8$
9.  $c = 78.8$
10.  $c = 1.57$

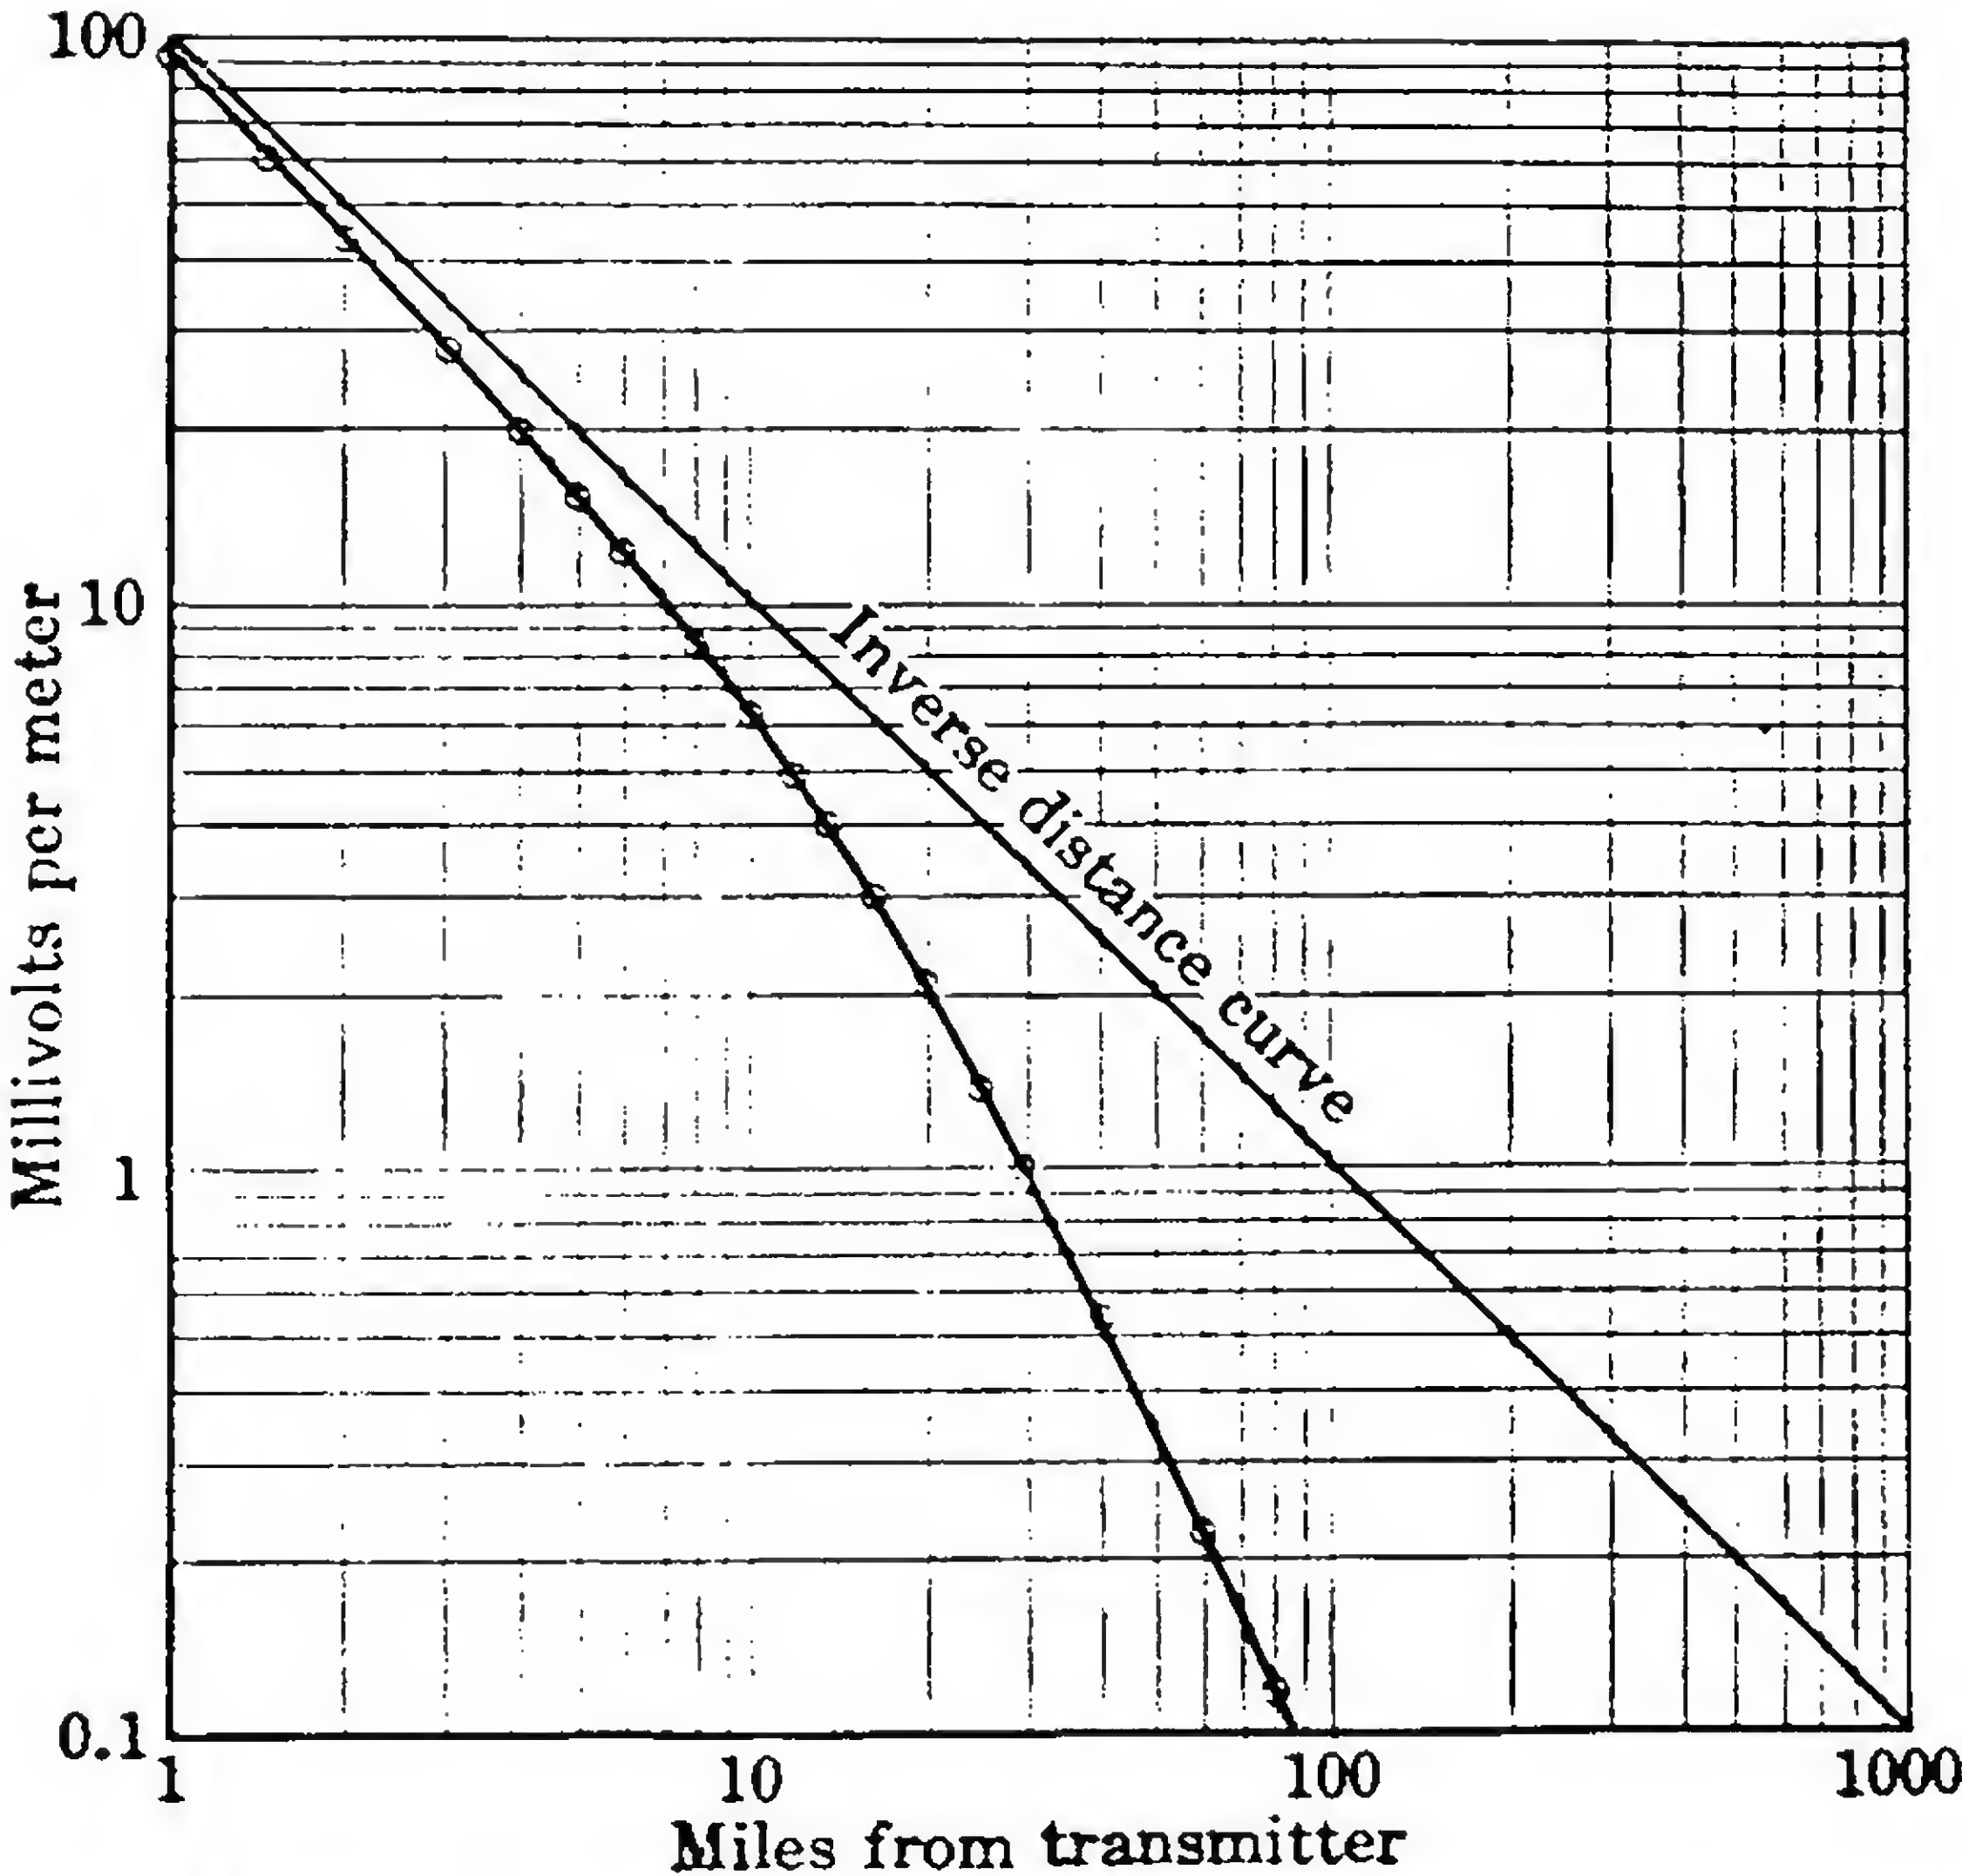

## Chapter 7

1.  $c = 43.3015 + j25.000$
2.  $c = 5.0000 - j8.6603$
3.  $c = 36.05/123.68$
4.  $A \times B = -130.74 + j1494.285$
5.  $A/B = 0.1758 - j0.3770$

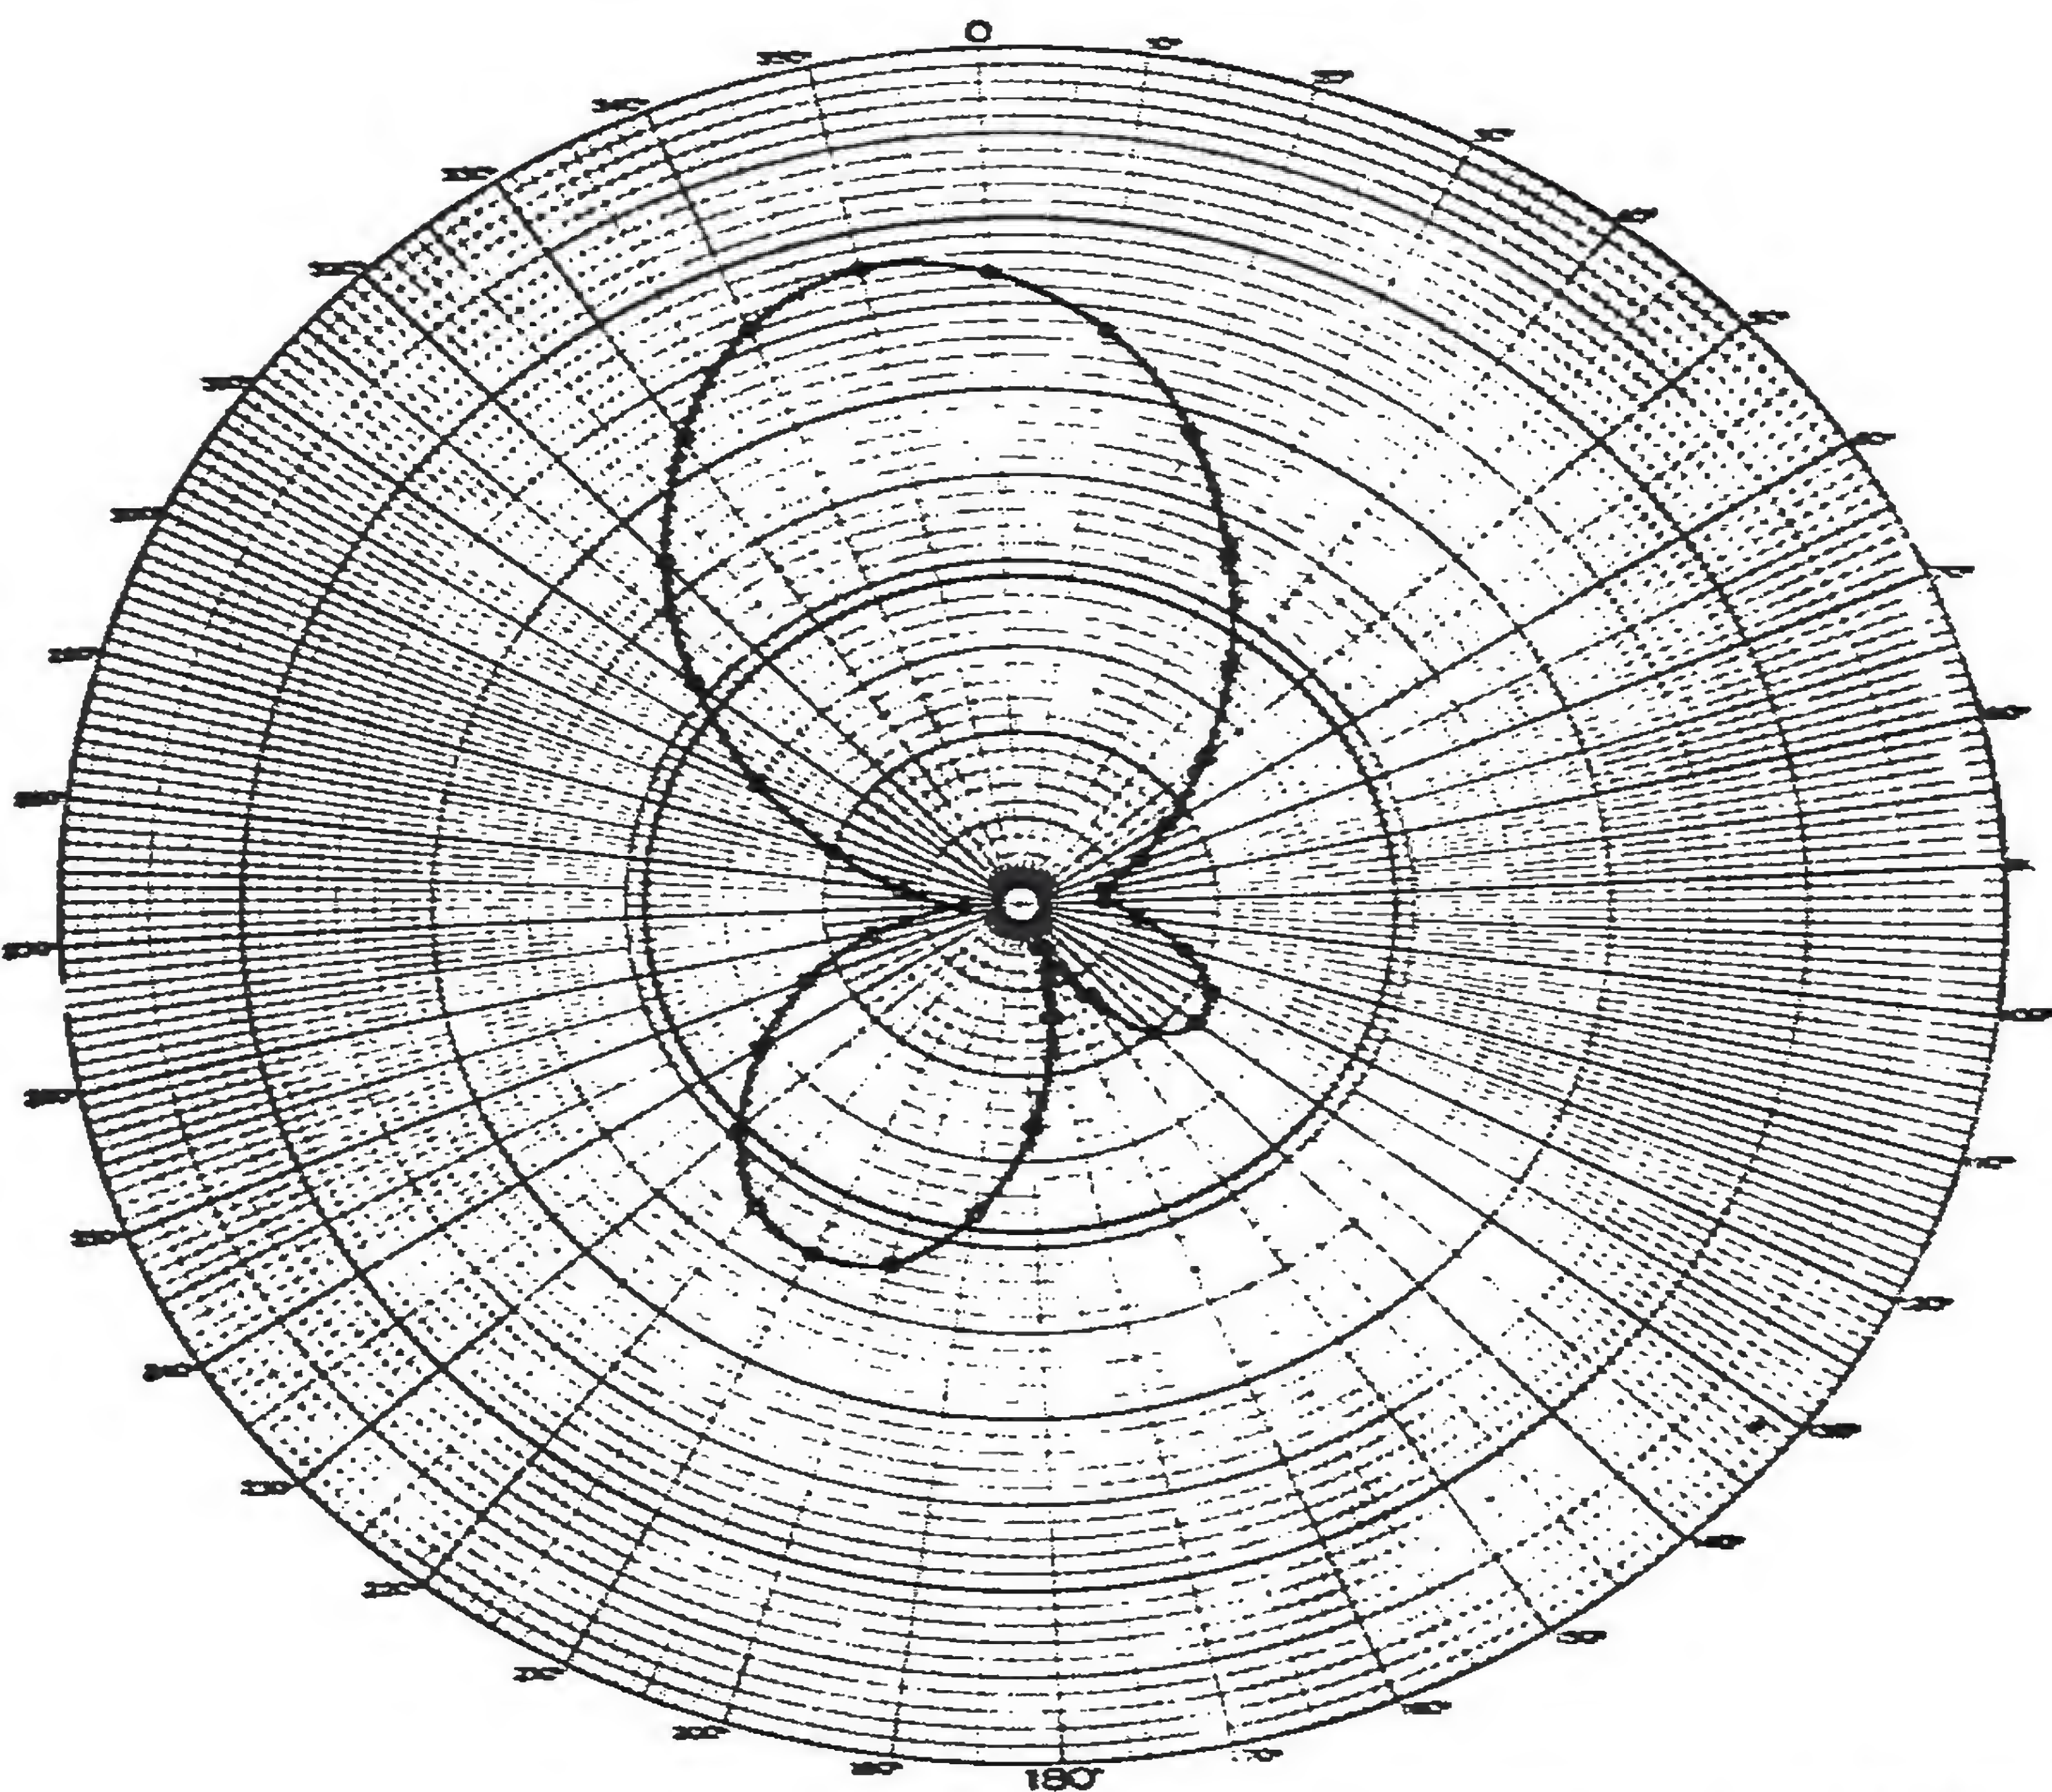

Chapter 8

1. Plot of  $B$ - $H$  curve

2. Plot of field intensity measurements, along a radial

3. Plot of field intensity polar pattern for a three-tower directional antenna

### Chapter 9

1. Dependent
2.  $x = 3$        $y = 5$
3. Inconsistent
4. Dependent
5. Inconsistent
6.  $x = 1$        $y = 2$        $z = 10$
7.  $x = 2$        $y = \frac{2}{5}$
8.  $x = b$        $y = a$
9.  $x = 8.65$        $y = 1.4$
10.  $R_1 = 10$        $R_2 = 20$

### Chapter 10

- |                                     |                                       |                    |
|-------------------------------------|---------------------------------------|--------------------|
| 1. $x = 7$ or $-1$                  | 5. $x = \frac{2}{3}$ or $\frac{3}{2}$ | 8. $k = 4$ or $0$  |
| 2. $x = -14$ or $2$                 | 6. $x = \sqrt{r/2}$ or $\sqrt{s/2}$   | 9. $k = 2$ or $-6$ |
| 3. $x = 3 \pm \sqrt{13}$            | 7. $x = r/s$ or $s/r$                 | 10. $f = 6$ or $8$ |
| 4. $x = \frac{3 \pm \sqrt{89}}{10}$ |                                       |                    |

## Chapter 11

1.  $\beta = 4$  circular radians.
2.  $\alpha = 6$  hyperbolic radians.  
 $e^\alpha = 403.4$
3.  $y = \pm 0.707$
4.  $y = \pm 1.732$
5.  $\cosh \alpha$  varies from 1 to  $\infty$  as  $\alpha$  is increased from 0 to  $\infty$  while  $\sinh \alpha$  varies from 0 to  $\infty$  as  $\alpha$  is increased from 0 to  $\infty$ .
6.  $\sin \beta$  and  $\cos \beta$  vary between the limits of  $\pm 1$ . The limits of  $\tan \beta$  are  $\pm \infty$ .
7.  $e^{j\beta}$  multiplied by a vector will rotate the vector  $\beta$  radians.  $e^\alpha$  multiplied by a vector will change only its magnitude.
8.  $\tanh \alpha = 0.76159$   
 $\sinh \alpha = 1.17520$   
 $\cosh \alpha = 1.54308$   
 $\coth \alpha = 1.313$   
 $\alpha = 1$  radian.

## Chapter 12

1.  $\frac{dy}{dx} = 2ax + b$
2.  $\frac{dy}{dx} = 3\sqrt{\frac{x}{2}}$
3.  $\frac{dy}{dx} = 2(a + x)$
4.  $\frac{dy}{dx} = \frac{bx}{2\sqrt{a + bx}} + \sqrt{a + bx}$
5.  $\frac{dy}{dx} = \frac{-2a}{(a + x)^2}$
6.  $\frac{d^2y}{dx^2} = -\frac{1}{4}x^{-3/2}$
7.  $\frac{dI}{dt} = b + 2ct$
8.  $v = 16; a = 8$
9. For  $x = 1, y = 2$ , a minimum  
 $x = -1, y = 6$ , a maximum
10.  $t = 16$  sec

## Chapter 13

1.  $e^2 = 7.38905$
2.  $dy/dx = (\alpha + \beta)e^{(\alpha+\beta)x}$
3.  $dy/dx = 2/x$
4.  $d(\sin x)/dx = \cos x$
5.  $\log 8 = 0.9031$
6.  $E = LI\omega \cos \omega t$
7.  $dy/d\theta = -2 \cos \theta \sin \theta$
8.  $dy/d\theta = -\csc^2 \theta$
9.  $d^2y/dx^2 = \alpha^2 \cosh \alpha x$
10.  $F = -1/2$ , a minimum

## Chapter 14

1.  $I_{av} = \frac{A}{\text{total } x} = \frac{10^\circ(5.7149)}{90^\circ} = 0.6349$
2.  $I_{av} = \frac{A}{\text{total } x} = \frac{\frac{15^\circ}{3}(11.4592)}{90^\circ} = 0.6366$
3.  $I_{av} = \frac{A}{\text{total } x} = \frac{1}{\pi/2} = \frac{2}{\pi} = 0.6366$

The trapezoidal rule using nine strips gives an accuracy to two decimal places. Simpson's rule using only six strips gives an accuracy to four decimal places. The integral gives the exact answer  $\frac{2}{\pi}$

4.  $S_n = 0.6345$
5.  $\int \frac{dx}{x^5} = \frac{x^{-4}}{-4} + C$   
 $\int ax^9 dx = \frac{a}{10} x^{10} + C$
6.  $\int 2(x+1) dx = x^2 + 2x + C$   
 $\int 4(x^2+2)(x-1) dx = x^4 - \frac{4}{3}x^3 + 4x^2 - 8x + C$
7.  $\int a^2 \frac{dx}{x} = a^2 \ln x + C$
8.  $\int x^2 e^x dx = x^2 e^x - 2x e^x + 2e^x + C$
9.  $\int \cos 6\omega t d(\omega t) = \frac{1}{6} \sin 6\omega t + C$   
 $\int 16^{2x} dx = \frac{16^{2x}}{2 \ln 16} + C$
10.  $\int a \ln 10x dx = ax(\ln 10x - x) + C$

## Chapter 15

1. The  $n^{\text{th}}$  term is  $\frac{nx^n}{n}$  or  $\frac{x^n}{n-1}$

The given series is

$$S_n = 0 + x + \frac{x^2}{1} + \frac{x^3}{2} + \cdots + \frac{x^n}{n-1}$$

while the convergent test series is

$$S_n = 1 + x + x^2 + x^3 + \cdots + x^n$$

Comparing term by term, the given series is equal or less than corresponding terms of the test series; hence the series is convergent.

2. Given series  $S_n = 1 + \frac{1}{2\frac{2}{3}} + \frac{1}{3\frac{2}{3}} + \cdots + \frac{1}{n\frac{2}{3}}$

$$\text{Test series } S_n = 1 + \frac{1}{2^p} + \frac{1}{3^p} + \cdots + \frac{1}{n^p}$$

Comparing terms, the exponent  $p$  is less than 1; hence the series is convergent and the  $n^{\text{th}}$  term is given by the first equation.

3. Ratio test  $\frac{\frac{1}{n}}{\frac{1}{n-1}} = \frac{1}{n} < 1$ ; hence the series is convergent.

4.  $\sqrt{37} = (1 + 6^2)^{\frac{1}{2}} = 6 \left(1 + \frac{1}{6^2}\right)^{\frac{1}{2}} = 6 + \frac{1}{12} - \frac{1}{1728} + \cdots$   
 $= 6.082754$  accurate to four decimal places  
 $= 6.082763$ . Check by extracting the square root.

5.  $f(x) = \sin x$                        $f(0) = 0$   
 $f'(x) = \cos x$                        $f'(0) = 1$   
 $f''(x) = -\sin x$                        $f''(0) = 0$   
 $f'''(x) = -\cos x$                        $f'''(0) = -1$

From these values

$$\begin{aligned}\sin x &= 0 + x + 0 - \frac{x^3}{\underline{3}} + 0 + \frac{x^5}{\underline{5}} + \dots \\ &= x - \frac{x^3}{\underline{3}} + \frac{x^5}{\underline{5}} - \dots\end{aligned}$$

6. Dividing the series of  $\sin x$  by  $1 - x$  gives

$$\frac{\sin x}{1 - x} = x + x^2 + \frac{5}{6}x^3 + \dots$$

$$\begin{aligned}7. \epsilon^{2.1} &= \epsilon^2 + (2.1 - 2)\epsilon^2 + \frac{(2.1 - 2)^2}{\underline{2}}\epsilon^2 \\ &= 7.3891(1 + \frac{1}{10} + \frac{1}{200}) = 7.3891(1.105) = 8.1670\end{aligned}$$

The tables give  $\epsilon^{2.1} = 8.1660$ , or an error of 0.0008.

$$8. M_3/\underline{\psi_3} = \frac{j}{\pi} \int_0^{\pi} \epsilon^{-j3x} dx + \frac{j}{\pi} \int_{\pi}^{2\pi} -E\epsilon^{-j3x} dx = \frac{4E}{3\pi} \underline{/0^\circ}$$

$$M_3 \sin (3\omega t + \psi_3) = \frac{4E}{\pi} \left( \frac{1}{3} \sin 3\omega t \right)$$

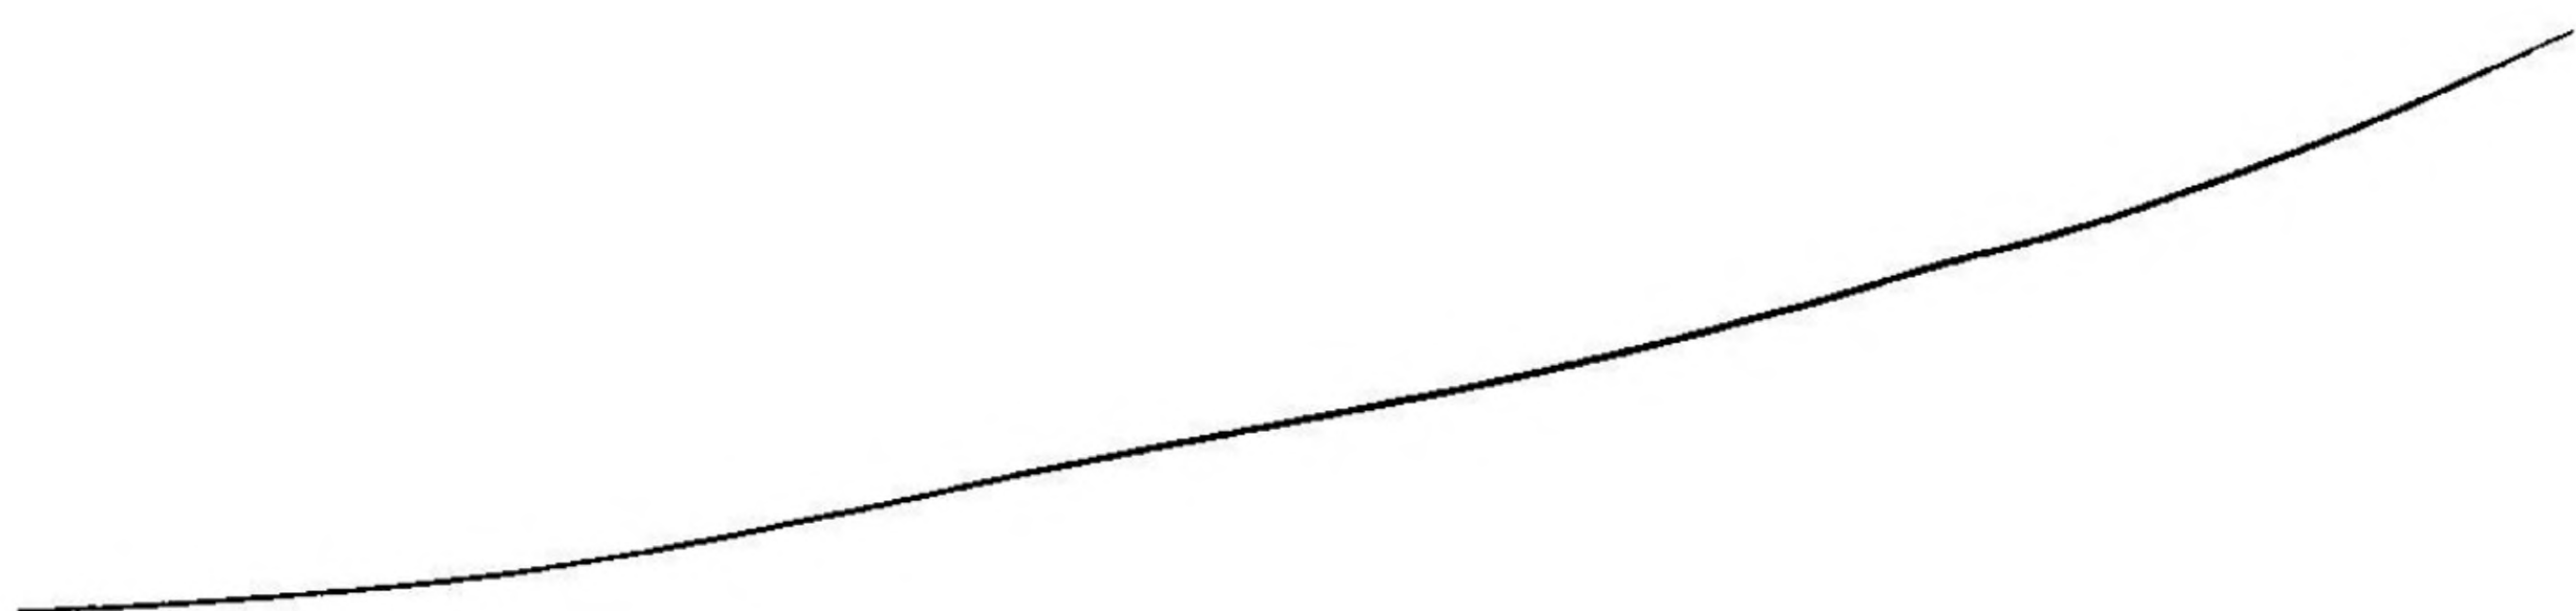

$$9. M_2/\underline{\psi_2} = \frac{j}{\pi} \int_{-\pi}^{+\pi} \frac{E}{\pi} x\epsilon^{-j2x} dx = \frac{-E}{2\pi} \underline{/0^\circ}$$

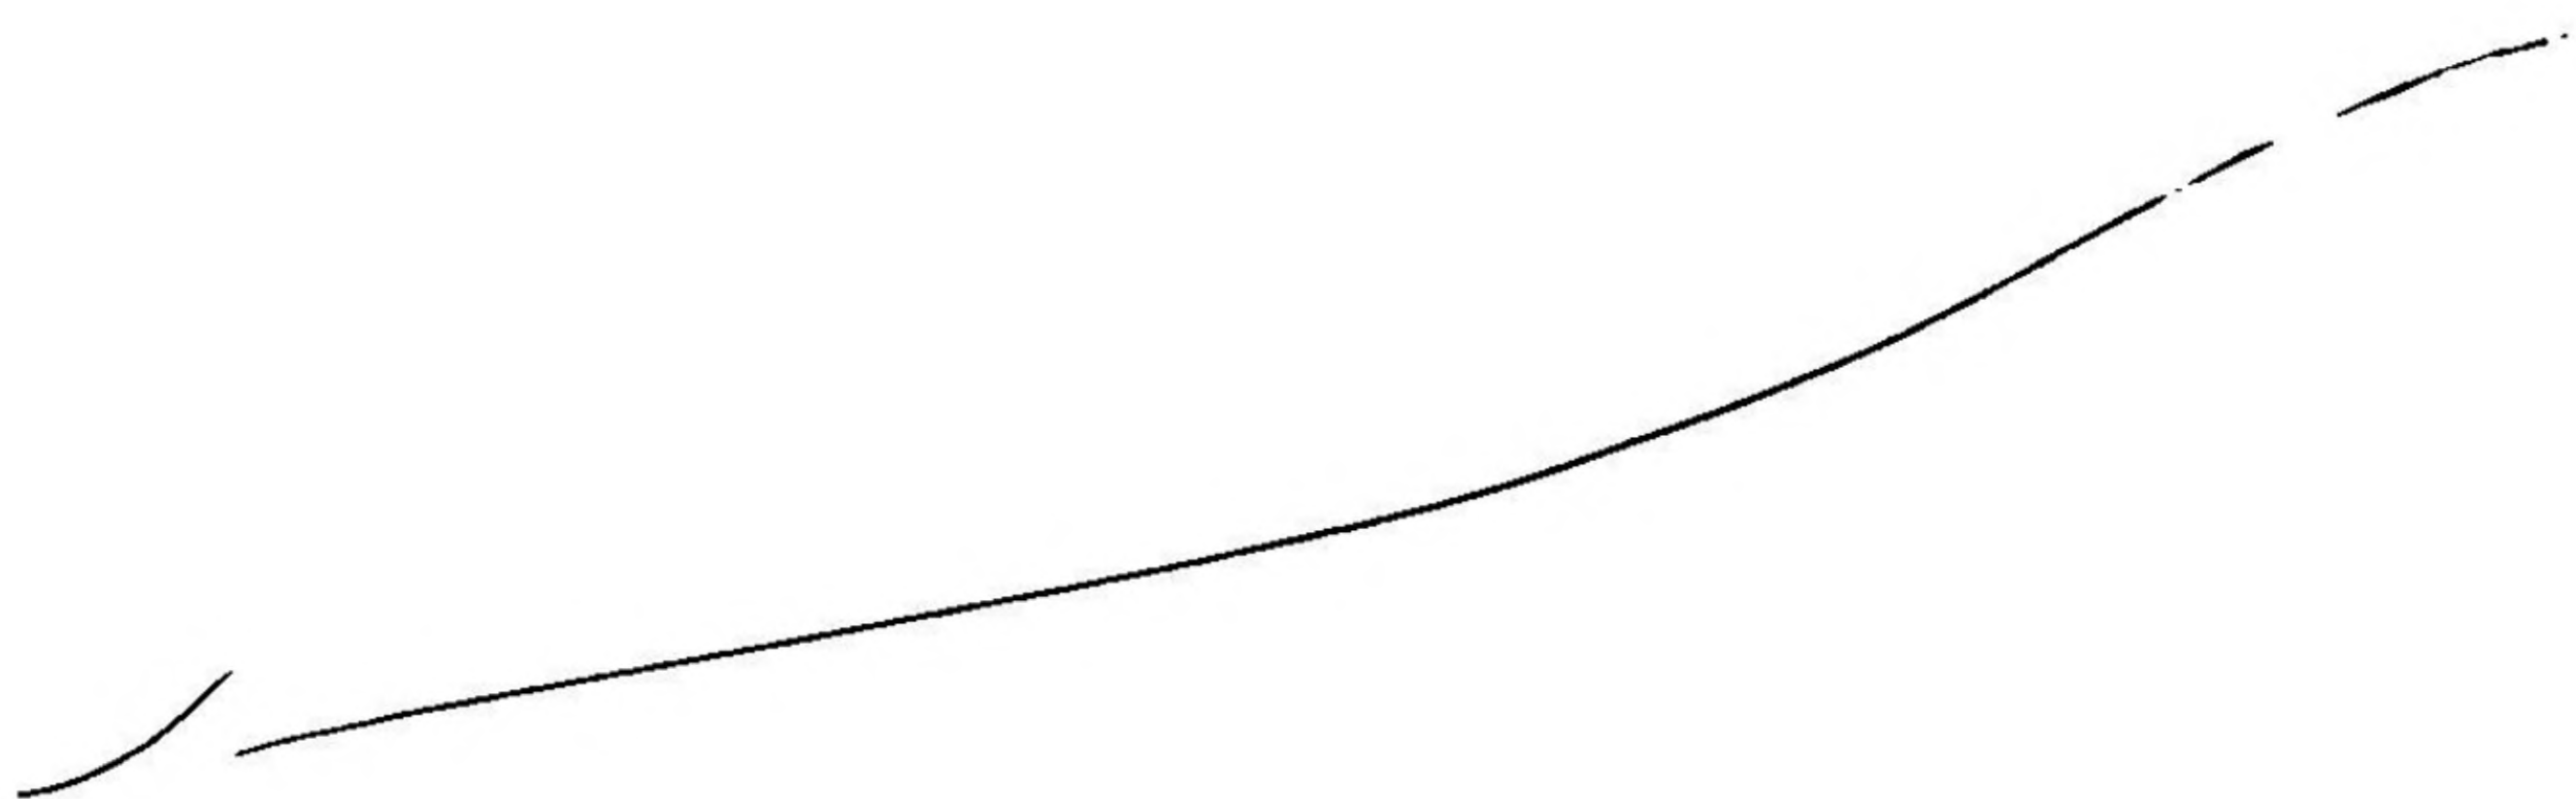

$$M_2 \sin (2\omega t + \psi_2) = \frac{-E}{\pi} \sin 2\omega t$$

$$\begin{aligned}10. M_1/\underline{\psi_1} &= \frac{j}{\pi} \int_{-\frac{\pi}{2}}^{+\frac{\pi}{2}} \frac{2E}{\pi} x\epsilon^{-jx} dx + \frac{j}{\pi} \int_{\frac{\pi}{2}}^{\frac{3\pi}{2}} \left( 2E - \frac{2E}{\pi} x \right) \epsilon^{-jx} dx \\ &= \frac{8E}{\pi^2}\end{aligned}$$

$$m_1 \sin (\omega t + \psi_1) = \frac{8E}{\pi^2} \sin \omega t$$

## **SOME DOVER SCIENCE BOOKS**

## SOME DOVER SCIENCE BOOKS

### WHAT IS SCIENCE?, *Norman Campbell*

This excellent introduction explains scientific method, role of mathematics, types of scientific laws. Contents: 2 aspects of science, science & nature, laws of science, discovery of laws, explanation of laws, measurement & numerical laws, applications of science. 192pp. 5 $\frac{3}{8}$  x 8. Paperbound \$1.25

### FADS AND FALLACIES IN THE NAME OF SCIENCE, *Martin Gardner*

Examines various cults, quack systems, frauds, delusions which at various times have masqueraded as science. Accounts of hollow-earth fanatics like Symmes; Velikovsky and wandering planets; Hoerbiger; Bellamy and the theory of multiple moons; Charles Fort; dowsing, pseudoscientific methods for finding water, ores, oil. Sections on naturopathy, iridagnosis, zone therapy, food fads, etc. Analytical accounts of Wilhelm Reich and orgone sex energy; L. Ron Hubbard and Dianetics; A. Korzybski and General Semantics; many others. Brought up to date to include Bridey Murphy, others. Not just a collection of anecdotes, but a fair, reasoned appraisal of eccentric theory. Formerly titled *In the Name of Science*. Preface. Index. x + 384pp. 5 $\frac{3}{8}$  x 8. Paperbound \$1.85

### PHYSICS, THE PIONEER SCIENCE, *L. W. Taylor*

First thorough text to place all important physical phenomena in cultural-historical framework; remains best work of its kind. Exposition of physical laws, theories developed chronologically, with great historical, illustrative experiments diagrammed, described, worked out mathematically. Excellent physics text for self-study as well as class work. Vol. 1: Heat, Sound: motion, acceleration, gravitation, conservation of energy, heat engines, rotation, heat, mechanical energy, etc. 211 illus. 407pp. 5 $\frac{3}{8}$  x 8. Vol. 2: Light, Electricity: images, lenses, prisms, magnetism, Ohm's law, dynamos, telegraph, quantum theory, decline of mechanical view of nature, etc. Bibliography. 13 table appendix. Index. 551 illus. 2 color plates. 508pp. 5 $\frac{3}{8}$  x 8.

Vol. 1 Paperbound \$2.25, Vol. 2 Paperbound \$2.25,  
The set \$4.50

### THE EVOLUTION OF SCIENTIFIC THOUGHT FROM NEWTON TO EINSTEIN, *A. d'Abro*

Einstein's special and general theories of relativity, with their historical implications, are analyzed in non-technical terms. Excellent accounts of the contributions of Newton, Riemann, Weyl, Planck, Eddington, Maxwell, Lorentz and others are treated in terms of space and time, equations of electromagnetics, finiteness of the universe, methodology of science. 21 diagrams. 482pp. 5 $\frac{3}{8}$  x 8. Paperbound \$2.50

## CATALOGUE OF DOVER BOOKS

### CHANCE, LUCK AND STATISTICS: THE SCIENCE OF CHANCE, *Horace C. Levinson*

Theory of probability and science of statistics in simple, non-technical language. Part I deals with theory of probability, covering odd superstitions in regard to "luck," the meaning of betting odds, the law of mathematical expectation, gambling, and applications in poker, roulette, lotteries, dice, bridge, and other games of chance. Part II discusses the misuse of statistics, the concept of statistical probabilities, normal and skew frequency distributions, and statistics applied to various fields—birth rates, stock speculation, insurance rates, advertising, etc. "Presented in an easy humorous style which I consider the best kind of expository writing," Prof. A. C. Cohen, Industry Quality Control. Enlarged revised edition. Formerly titled *The Science of Chance*. Preface and two new appendices by the author. Index. xiv + 365pp. 5 $\frac{3}{8}$  x 8. Paperbound \$2.00

### BASIC ELECTRONICS,

*prepared by the U.S. Navy Training Publications Center*

A thorough and comprehensive manual on the fundamentals of electronics. Written clearly, it is equally useful for self-study or course work for those with a knowledge of the principles of basic electricity. Partial contents: Operating Principles of the Electron Tube; Introduction to Transistors; Power Supplies for Electronic Equipment; Tuned Circuits; Electron-Tube Amplifiers; Audio Power Amplifiers; Oscillators; Transmitters; Transmission Lines; Antennas and Propagation; Introduction to Computers; and related topics. Appendix. Index. Hundreds of illustrations and diagrams. vi + 471pp. 6 $\frac{1}{2}$  x 9 $\frac{1}{4}$ .

Paperbound \$2.75

### BASIC THEORY AND APPLICATION OF TRANSISTORS,

*prepared by the U.S. Department of the Army*

An introductory manual prepared for an army training program. One of the finest available surveys of theory and application of transistor design and operation. Minimal knowledge of physics and theory of electron tubes required. Suitable for textbook use, course supplement, or home study. Chapters: Introduction; fundamental theory of transistors; transistor amplifier fundamentals; parameters, equivalent circuits, and characteristic curves; bias stabilization; transistor analysis and comparison using characteristic curves and charts; audio amplifiers; tuned amplifiers; wide-band amplifiers; oscillators; pulse and switching circuits; modulation, mixing, and demodulation; and additional semiconductor devices. Unabridged, corrected edition. 240 schematic drawings, photographs, wiring diagrams, etc. 2 Appendices. Glossary. Index. 263pp. 6 $\frac{1}{2}$  x 9 $\frac{1}{4}$ .

Paperbound \$1.25

### GUIDE TO THE LITERATURE OF MATHEMATICS AND PHYSICS,

*N. G. Parke III*

Over 5000 entries included under approximately 120 major subject headings of selected most important books, monographs, periodicals, articles in English, plus important works in German, French, Italian, Spanish, Russian (many recently available works). Covers every branch of physics, math, related engineering. Includes author, title, edition, publisher, place, date, number of volumes, number of pages. A 40-page introduction on the basic problems of research and study provides useful information on the organization and use of libraries, the psychology of learning, etc. This reference work will save you hours of time. 2nd revised edition. Indices of authors, subjects. 464pp. 5 $\frac{3}{8}$  x 8.

Paperbound \$2.75

## CATALOGUE OF DOVER BOOKS

### THE RISE OF THE NEW PHYSICS (formerly THE DECLINE OF MECHANISM), *A. d'Abro*

This authoritative and comprehensive 2-volume exposition is unique in scientific publishing. Written for intelligent readers not familiar with higher mathematics, it is the only thorough explanation in non-technical language of modern mathematical-physical theory. Combining both history and exposition, it ranges from classical Newtonian concepts up through the electronic theories of Dirac and Heisenberg, the statistical mechanics of Fermi, and Einstein's relativity theories. "A must for anyone doing serious study in the physical sciences," *J. of Franklin Inst.* 97 illustrations. 991pp. 2 volumes.

Vol. 1 Paperbound \$2.25, Vol. 2 Paperbound \$2.25,  
The set \$4.50

### THE STRANGE STORY OF THE QUANTUM, AN ACCOUNT FOR THE GENERAL READER OF THE GROWTH OF IDEAS UNDERLYING OUR PRESENT ATOMIC KNOWLEDGE, *B. Hoffmann*

Presents lucidly and expertly, with barest amount of mathematics, the problems and theories which led to modern quantum physics. Dr. Hoffmann begins with the closing years of the 19th century, when certain trifling discrepancies were noticed, and with illuminating analogies and examples takes you through the brilliant concepts of Planck, Einstein, Pauli, de Broglie, Bohr, Schroedinger, Heisenberg, Dirac, Sommerfeld, Feynman, etc. This edition includes a new, long postscript carrying the story through 1958. "Of the books attempting an account of the history and contents of our modern atomic physics which have come to my attention, this is the best," H. Margenau, Yale University, in *American Journal of Physics*. 32 tables and line illustrations. Index. 275pp.  $5\frac{3}{8} \times 8$ .

Paperbound \$1.75

### GREAT IDEAS AND THEORIES OF MODERN COSMOLOGY, *Jagjit Singh*

The theories of Jeans, Eddington, Milne, Kant, Bondi, Gold, Newton, Einstein, Gamow, Hoyle, Dirac, Kuiper, Hubble, Weizsäcker and many others on such cosmological questions as the origin of the universe, space and time, planet formation, "continuous creation," the birth, life, and death of the stars, the origin of the galaxies, etc. By the author of the popular *Great Ideas of Modern Mathematics*. A gifted popularizer of science, he makes the most difficult abstractions crystal-clear even to the most non-mathematical reader. Index. xii + 276pp.  $5\frac{3}{8} \times 8\frac{1}{2}$ .

Paperbound \$2.00

### GREAT IDEAS OF MODERN MATHEMATICS: THEIR NATURE AND USE, *Jagjit Singh*

Reader with only high school math will understand main mathematical ideas of modern physics, astronomy, genetics, psychology, evolution, etc., better than many who use them as tools, but comprehend little of their basic structure. Author uses his wide knowledge of non-mathematical fields in brilliant exposition of differential equations, matrices, group theory, logic, statistics, problems of mathematical foundations, imaginary numbers, vectors, etc. Original publications, 2 appendices. 2 indexes. 65 illustr. 322pp.  $5\frac{3}{8} \times 8$ . Paperbound \$2.00

### THE MATHEMATICS OF GREAT AMATEURS, *Julian L. Coolidge*

Great discoveries made by poets, theologians, philosophers, artists and other non-mathematicians: Omar Khayyam, Leonardo da Vinci, Albrecht Dürer, John Napier, Pascal, Diderot, Bolzano, etc. Surprising accounts of what can result from a non-professional preoccupation with the oldest of sciences. 56 figures. viii + 211pp.  $5\frac{3}{8} \times 8\frac{1}{2}$ .

Paperbound \$1.50

## CATALOGUE OF DOVER BOOKS

### COLLEGE ALGEBRA, *H. B. Fine*

Standard college text that gives a systematic and deductive structure to algebra; comprehensive, connected, with emphasis on theory. Discusses the commutative, associative, and distributive laws of number in unusual detail, and goes on with undetermined coefficients, quadratic equations, progressions, logarithms, permutations, probability, power series, and much more. Still most valuable elementary-intermediate text on the science and structure of algebra. Index. 1560 problems, all with answers. x + 631pp.  $5\frac{3}{8}$  x 8. Paperbound \$2.75

### HIGHER MATHEMATICS FOR STUDENTS OF CHEMISTRY AND PHYSICS,

*J. W. Mellor*

Not abstract, but practical, building its problems out of familiar laboratory material, this covers differential calculus, coordinate, analytical geometry, functions, integral calculus, infinite series, numerical equations, differential equations, Fourier's theorem, probability, theory of errors, calculus of variations, determinants. "If the reader is not familiar with this book, it will repay him to examine it," *Chem. & Engineering News*. 800 problems. 189 figures. Bibliography. xxi + 641pp.  $5\frac{3}{8}$  x 8. Paperbound \$2.50

### TRIGONOMETRY REFRESHER FOR TECHNICAL MEN,

*A. A. Klaf*

A modern question and answer text on plane and spherical trigonometry. Part I covers plane trigonometry: angles, quadrants, trigonometrical functions, graphical representation, interpolation, equations, logarithms, solution of triangles, slide rules, etc. Part II discusses applications to navigation, surveying, elasticity, architecture, and engineering. Small angles, periodic functions, vectors, polar coordinates, De Moivre's theorem, fully covered. Part III is devoted to spherical trigonometry and the solution of spherical triangles, with applications to terrestrial and astronomical problems. Special time-savers for numerical calculation. 913 questions answered for you! 1738 problems; answers to odd numbers. 494 figures. 14 pages of functions, formulae. Index. x + 629pp.  $5\frac{3}{8}$  x 8.

Paperbound \$2.00

### CALCULUS REFRESHER FOR TECHNICAL MEN,

*A. A. Klaf*

Not an ordinary textbook but a unique refresher for engineers, technicians, and students. An examination of the most important aspects of differential and integral calculus by means of 756 key questions. Part I covers simple differential calculus: constants, variables, functions, increments, derivatives, logarithms, curvature, etc. Part II treats fundamental concepts of integration: inspection, substitution, transformation, reduction, areas and volumes, mean value, successive and partial integration, double and triple integration. Stresses practical aspects! A 50 page section gives applications to civil and nautical engineering, electricity, stress and strain, elasticity, industrial engineering, and similar fields. 756 questions answered. 556 problems; solutions to odd numbers. 36 pages of constants, formulae. Index. v + 431pp.  $5\frac{3}{8}$  x 8.

Paperbound \$2.00

### INTRODUCTION TO THE THEORY OF GROUPS OF FINITE ORDER,

*R. Carmichael*

Examines fundamental theorems and their application. Beginning with sets, systems, permutations, etc., it progresses in easy stages through important types of groups: Abelian, prime power, permutation, etc. Except 1 chapter where matrices are desirable, no higher math needed. 783 exercises, problems. Index. xvi + 447pp.  $5\frac{3}{8}$  x 8.

Paperbound \$3.00

## CATALOGUE OF DOVER BOOKS

### FIVE VOLUME "THEORY OF FUNCTIONS" SET BY KONRAD KNOPP

This five-volume set, prepared by Konrad Knopp, provides a complete and readily followed account of theory of functions. Proofs are given concisely, yet without sacrifice of completeness or rigor. These volumes are used as texts by such universities as M.I.T., University of Chicago, N. Y. City College, and many others. "Excellent introduction . . . remarkably readable, concise, clear, rigorous," *Journal of the American Statistical Association*.

#### ELEMENTS OF THE THEORY OF FUNCTIONS, Konrad Knopp

This book provides the student with background for further volumes in this set, or texts on a similar level. Partial contents: foundations, system of complex numbers and the Gaussian plane of numbers, Riemann sphere of numbers, mapping by linear functions, normal forms, the logarithm, the cyclometric functions and binomial series. "Not only for the young student, but also for the student who knows all about what is in it," *Mathematical Journal*. Bibliography. Index. 140pp.  $5\frac{3}{8} \times 8$ . Paperbound \$1.50

#### THEORY OF FUNCTIONS, PART I, Konrad Knopp

With volume II, this book provides coverage of basic concepts and theorems. Partial contents: numbers and points, functions of a complex variable, integral of a continuous function, Cauchy's integral theorem, Cauchy's integral formulae, series with variable terms, expansion of analytic functions in power series, analytic continuation and complete definition of analytic functions, entire transcendental functions, Laurent expansion, types of singularities. Bibliography. Index. vii + 146pp.  $5\frac{3}{8} \times 8$ . Paperbound \$1.35

#### THEORY OF FUNCTIONS, PART II, Konrad Knopp

Application and further development of general theory, special topics. Single valued functions. Entire, Weierstrass, Meromorphic functions. Riemann surfaces. Algebraic functions. Analytical configuration, Riemann surface. Bibliography. Index. x + 150pp.  $5\frac{3}{8} \times 8$ . Paperbound \$1.35

#### PROBLEM BOOK IN THE THEORY OF FUNCTIONS, VOLUME 1. Konrad Knopp

Problems in elementary theory, for use with Knopp's *Theory of Functions*, or any other text, arranged according to increasing difficulty. Fundamental concepts, sequences of numbers and infinite series, complex variable, integral theorems, development in series, conformal mapping. 182 problems. Answers. viii + 126pp.  $5\frac{3}{8} \times 8$ . Paperbound \$1.35

#### PROBLEM BOOK IN THE THEORY OF FUNCTIONS, VOLUME 2, Konrad Knopp

Advanced theory of functions, to be used either with Knopp's *Theory of Functions*, or any other comparable text. Singularities, entire & meromorphic functions, periodic, analytic, continuation, multiple-valued functions, Riemann surfaces, conformal mapping. Includes a section of additional elementary problems. "The difficult task of selecting from the immense material of the modern theory of functions the problems just within the reach of the beginner is here masterfully accomplished," *Am. Math. Soc.* Answers. 138pp.  $5\frac{3}{8} \times 8$ . Paperbound \$1.50

## CATALOGUE OF DOVER BOOKS

### NUMERICAL SOLUTIONS OF DIFFERENTIAL EQUATIONS,

*H. Levy & E. A. Baggott*

Comprehensive collection of methods for solving ordinary differential equations of first and higher order. All must pass 2 requirements: easy to grasp and practical, more rapid than school methods. Partial contents: graphical integration of differential equations, graphical methods for detailed solution. Numerical solution. Simultaneous equations and equations of 2nd and higher orders. "Should be in the hands of all in research in applied mathematics, teaching." *Nature*. 21 figures. viii + 238pp. 5 $\frac{3}{8}$  x 8. Paperbound \$1.85

### ELEMENTARY STATISTICS, WITH APPLICATIONS IN MEDICINE AND THE BIOLOGICAL SCIENCES, *F. E. Croxton*

A sound introduction to statistics for anyone in the physical sciences, assuming no prior acquaintance and requiring only a modest knowledge of math. All basic formulas carefully explained and illustrated; all necessary reference tables included. From basic terms and concepts, the study proceeds to frequency distribution, linear, non-linear, and multiple correlation, skewness, kurtosis, etc. A large section deals with reliability and significance of statistical methods. Containing concrete examples from medicine and biology, this book will prove unusually helpful to workers in those fields who increasingly must evaluate, check, and interpret statistics. Formerly titled "Elementary Statistics with Applications in Medicine." 101 charts. 57 tables. 14 appendices. Index. vi + 376pp. 5 $\frac{3}{8}$  x 8. Paperbound \$2.00

### INTRODUCTION TO SYMBOLIC LOGIC,

*S. Langer*

No special knowledge of math required — probably the clearest book ever written on symbolic logic, suitable for the layman, general scientist, and philosopher. You start with simple symbols and advance to a knowledge of the Boole-Schroeder and Russell-Whitehead systems. Forms, logical structure, classes, the calculus of propositions, logic of the syllogism, etc. are all covered. "One of the clearest and simplest introductions," *Mathematics Gazette*. Second enlarged, revised edition. 368pp. 5 $\frac{3}{8}$  x 8. Paperbound \$2.00

### A SHORT ACCOUNT OF THE HISTORY OF MATHEMATICS,

*W. W. R. Ball*

Most readable non-technical history of mathematics treats lives, discoveries of every important figure from Egyptian, Phoenician, mathematicians to late 19th century. Discusses schools of Ionia, Pythagoras, Athens, Cyzicus, Alexandria, Byzantium, systems of numeration; primitive arithmetic; Middle Ages, Renaissance, including Arabs, Bacon, Regiomontanus, Tartaglia, Cardan, Stevinus, Galileo, Kepler; modern mathematics of Descartes, Pascal, Wallis, Huygens, Newton, Leibnitz, d'Alembert, Euler, Lambert, Laplace, Legendre, Gauss, Hermite, Weierstrass, scores more. Index. 25 figures. 546pp. 5 $\frac{3}{8}$  x 8. Paperbound \$2.25

### INTRODUCTION TO NONLINEAR DIFFERENTIAL AND INTEGRAL EQUATIONS,

*Harold T. Davis*

Aspects of the problem of nonlinear equations, transformations that lead to equations solvable by classical means, results in special cases, and useful generalizations. Thorough, but easily followed by mathematically sophisticated reader who knows little about non-linear equations. 137 problems for student to solve. xv + 566pp. 5 $\frac{3}{8}$  x 8 $\frac{1}{2}$ . Paperbound \$2.00

## CATALOGUE OF DOVER BOOKS

### AN INTRODUCTION TO THE GEOMETRY OF N DIMENSIONS, *D. H. Y. Sommerville*

An introduction presupposing no prior knowledge of the field, the only book in English devoted exclusively to higher dimensional geometry. Discusses fundamental ideas of incidence, parallelism, perpendicularity, angles between linear space; enumerative geometry; analytical geometry from projective and metric points of view; polytopes; elementary ideas in analysis situs; content of hyper-spacial figures. Bibliography. Index. 60 diagrams. 196pp.  $5\frac{3}{8} \times 8$ .

Paperbound \$1.50

### ELEMENTARY CONCEPTS OF TOPOLOGY, *P. Alexandroff*

First English translation of the famous brief introduction to topology for the beginner or for the mathematician not undertaking extensive study. This unusually useful intuitive approach deals primarily with the concepts of complex, cycle, and homology, and is wholly consistent with current investigations. Ranges from basic concepts of set-theoretic topology to the concept of Betti groups. "Glowing example of harmony between intuition and thought," David Hilbert. Translated by A. E. Farley. Introduction by D. Hilbert. Index. 25 figures. 73pp.  $5\frac{3}{8} \times 8$ .

Paperbound \$1.00

### ELEMENTS OF NON-EUCLIDEAN GEOMETRY, *D. M. Y. Sommerville*

Unique in proceeding step-by-step, in the manner of traditional geometry. Enables the student with only a good knowledge of high school algebra and geometry to grasp elementary hyperbolic, elliptic, analytic non-Euclidean geometries; space curvature and its philosophical implications; theory of radical axes; homothetic centres and systems of circles; parataxy and parallelism; absolute measure; Gauss' proof of the defect area theorem; geodesic representation; much more, all with exceptional clarity. 126 problems at chapter endings provide progressive practice and familiarity. 133 figures. Index. xvi + 274pp.  $5\frac{3}{8} \times 8$ .

Paperbound \$2.00

### INTRODUCTION TO THE THEORY OF NUMBERS, *L. E. Dickson*

Thorough, comprehensive approach with adequate coverage of classical literature, an introductory volume beginners can follow. Chapters on divisibility, congruences, quadratic residues & reciprocity. Diophantine equations, etc. Full treatment of binary quadratic forms without usual restriction to integral coefficients. Covers infinitude of primes, least residues. Fermat's theorem. Euler's phi function, Legendre's symbol, Gauss's lemma, automorphs, reduced forms, recent theorems of Thue & Siegel, many more. Much material not readily available elsewhere. 239 problems. Index. I figure. viii + 183pp.  $5\frac{3}{8} \times 8$ .

Paperbound \$1.75

### MATHEMATICAL TABLES AND FORMULAS,

*compiled by Robert D. Carmichael and Edwin R. Smith*

Valuable collection for students, etc. Contains all tables necessary in college algebra and trigonometry, such as five-place common logarithms, logarithmic sines and tangents of small angles, logarithmic trigonometric functions, natural trigonometric functions, four-place antilogarithms, tables for changing from sexagesimal to circular and from circular to sexagesimal measure of angles, etc. Also many tables and formulas not ordinarily accessible, including powers, roots, and reciprocals, exponential and hyperbolic functions, ten-place logarithms of prime numbers, and formulas and theorems from analytical and elementary geometry and from calculus. Explanatory introduction. viii + 269pp.  $5\frac{3}{8} \times 8\frac{1}{2}$ .

Paperbound \$1.25

## CATALOGUE OF DOVER BOOKS

### A SOURCE BOOK IN MATHEMATICS,

*D. E. Smith*

Great discoveries in math, from Renaissance to end of 19th century, in English translation. Read announcements by Dedekind, Gauss, Delamain, Pascal, Fermat, Newton, Abel, Lobachevsky, Bolyai, Riemann, De Moivre, Legendre, Laplace, others of discoveries about imaginary numbers, number congruence, slide rule, equations, symbolism, cubic algebraic equations, non-Euclidean forms of geometry, calculus, function theory, quaternions, etc. Succinct selections from 125 different treatises, articles, most unavailable elsewhere in English. Each article preceded by biographical introduction. Vol. I: Fields of Number, Algebra, Index. 32 illus. 338pp.  $5\frac{3}{8} \times 8$ . Vol. II: Fields of Geometry, Probability, Calculus, Functions, Quaternions. 83 illus. 432pp.  $5\frac{3}{8} \times 8$ .

Vol. 1 Paperbound \$2.00, Vol. 2 Paperbound \$2.00,  
The set \$4.00

### FOUNDATIONS OF PHYSICS,

*R. B. Lindsay & H. Margenau*

Excellent bridge between semi-popular works & technical treatises. A discussion of methods of physical description, construction of theory; valuable for physicist with elementary calculus who is interested in ideas that give meaning to data, tools of modern physics. Contents include symbolism; mathematical equations; space & time foundations of mechanics; probability; physics & continua; electron theory; special & general relativity; quantum mechanics; causality. "Thorough and yet not overdetailed. Unreservedly recommended," *Nature* (London). Unabridged, corrected edition. List of recommended readings. 35 illustrations. xi + 537pp.  $5\frac{3}{8} \times 8$ . Paperbound \$3.00

### FUNDAMENTAL FORMULAS OF PHYSICS,

*ed. by D. H. Menzel*

High useful, full, inexpensive reference and study text, ranging from simple to highly sophisticated operations. Mathematics integrated into text—each chapter stands as short textbook of field represented. Vol. 1: Statistics, Physical Constants, Special Theory of Relativity, Hydrodynamics, Aerodynamics, Boundary Value Problems in Math, Physics, Viscosity, Electromagnetic Theory, etc. Vol. 2: Sound, Acoustics, Geometrical Optics, Electron Optics, High-Energy Phenomena, Magnetism, Biophysics, much more. Index. Total of 800pp.  $5\frac{3}{8} \times 8$ .

Vol. 1 Paperbound \$2.25, Vol. 2 Paperbound \$2.25,  
The set \$4.50

### THEORETICAL PHYSICS,

*A. S. Kompaneys*

One of the very few thorough studies of the subject in this price range. Provides advanced students with a comprehensive theoretical background. Especially strong on recent experimentation and developments in quantum theory. Contents: Mechanics (Generalized Coordinates, Lagrange's Equation, Collision of Particles, etc.), Electrodynamics (Vector Analysis, Maxwell's equations, Transmission of Signals, Theory of Relativity, etc.), Quantum Mechanics (the Inadequacy of Classical Mechanics, the Wave Equation, Motion in a Central Field, Quantum Theory of Radiation, Quantum Theories of Dispersion and Scattering, etc.), and Statistical Physics (Equilibrium Distribution of Molecules in an Ideal Gas, Boltzmann Statistics, Bose and Fermi Distribution, Thermodynamic Quantities, etc.). Revised to 1961. Translated by George Yankovsky, authorized by Kompaneys. 137 exercises. 56 figures. 529pp.  $5\frac{3}{8} \times 8\frac{1}{2}$ .

Paperbound \$2.50

## CATALOGUE OF DOVER BOOKS

### MATHEMATICAL PHYSICS, *D. H. Menzel*

Thorough one-volume treatment of the mathematical techniques vital for classical mechanics, electromagnetic theory, quantum theory, and relativity. Written by the Harvard Professor of Astrophysics for junior, senior, and graduate courses, it gives clear explanations of all those aspects of function theory, vectors, matrices, dyadics, tensors, partial differential equations, etc., necessary for the understanding of the various physical theories. Electron theory, relativity, and other topics seldom presented appear here in considerable detail. Scores of definition, conversion factors, dimensional constants, etc. "More detailed than normal for an advanced text . . . excellent set of sections on Dyadics, Matrices, and Tensors," *Journal of the Franklin Institute*. Index. 193 problems, with answers. x + 412pp. 5 $\frac{3}{8}$  x 8. Paperbound \$2.50

### THE THEORY OF SOUND, *Lord Rayleigh*

Most vibrating systems likely to be encountered in practice can be tackled successfully by the methods set forth by the great Nobel laureate, Lord Rayleigh. Complete coverage of experimental, mathematical aspects of sound theory. Partial contents: Harmonic motions, vibrating systems in general, lateral vibrations of bars, curved plates or shells, applications of Laplace's functions to acoustical problems, fluid friction, plane vortex-sheet, vibrations of solid bodies, etc. This is the first inexpensive edition of this great reference and study work. Bibliography, Historical introduction by R. B. Lindsay. Total of 1040pp. 97 figures. 5 $\frac{3}{8}$  x 8. Vol. 1 Paperbound \$2.50, Vol. 2 Paperbound \$2.50, The set \$5.00

### HYDRODYNAMICS, *Horace Lamb*

Internationally famous complete coverage of standard reference work on dynamics of liquids & gases. Fundamental theorems, equations, methods, solutions, background, for classical hydrodynamics. Chapters include Equations of Motion, Integration of Equations in Special Cases, Irrotational Motion, Motion of Liquid in 2 Dimensions, Motion of Solids through Liquid-Dynamical Theory, Vortex Motion, Tidal Waves, Surface Waves, Waves of Expansion, Viscosity, Rotating Masses of Liquids. Excellently planned, arranged; clear, lucid presentation. 6th enlarged, revised edition. Index. Over 900 footnotes, mostly bibliographical. 119 figures. xv + 738pp. 6 $\frac{1}{8}$  x 9 $\frac{1}{4}$ . Paperbound \$4.00

### DYNAMICAL THEORY OF GASES, *James Jeans*

Divided into mathematical and physical chapters for the convenience of those not expert in mathematics, this volume discusses the mathematical theory of gas in a steady state, thermodynamics, Boltzmann and Maxwell, kinetic theory, quantum theory, exponentials, etc. 4th enlarged edition, with new material on quantum theory, quantum dynamics, etc. Indexes. 28 figures. 444pp. 6 $\frac{1}{8}$  x 9 $\frac{1}{4}$ . Paperbound \$2.75

### THERMODYNAMICS, *Enrico Fermi*

Unabridged reproduction of 1937 edition. Elementary in treatment; remarkable for clarity, organization. Requires no knowledge of advanced math beyond calculus, only familiarity with fundamentals of thermometry, calorimetry. Partial Contents: Thermodynamic systems; First & Second laws of thermodynamics; Entropy; Thermodynamic potentials: phase rule, reversible electric cell; Gaseous reactions: van't Hoff reaction box, principle of LeChatelier; Thermodynamics of dilute solutions: osmotic & vapor pressures, boiling & freezing points; Entropy constant. Index. 25 problems. 24 illustrations. x + 160pp. 5 $\frac{3}{8}$  x 8. Paperbound \$1.75

## CATALOGUE OF DOVER BOOKS

### CELESTIAL OBJECTS FOR COMMON TELESCOPES, *Rev. T. W. Webb*

Classic handbook for the use and pleasure of the amateur astronomer. Of inestimable aid in locating and identifying thousands of celestial objects. Vol I, The Solar System: discussions of the principle and operation of the telescope, procedures of observations and telescope-photography, spectroscopy, etc., precise location information of sun, moon, planets, meteors. Vol. II, The Stars: alphabetical listing of constellations, information on double stars, clusters, stars with unusual spectra, variables, and nebulae, etc. Nearly 4,000 objects noted. Edited and extensively revised by Margaret W. Mayall, director of the American Assn. of Variable Star Observers. New Index by Mrs. Mayall giving the location of all objects mentioned in the text for Epoch 2000. New Precession Table added. New appendices on the planetary satellites, constellation names and abbreviations, and solar system data. Total of 46 illustrations. Total of xxxix + 606pp.  $5\frac{3}{8} \times 8$ . Vol. 1 Paperbound \$2.25, Vol. 2 Paperbound \$2.25  
The set \$4.50

### PLANETARY THEORY,

*E. W. Brown and C. A. Shook*

Provides a clear presentation of basic methods for calculating planetary orbits for today's astronomer. Begins with a careful exposition of specialized mathematical topics essential for handling perturbation theory and then goes on to indicate how most of the previous methods reduce ultimately to two general calculation methods: obtaining expressions either for the coordinates of planetary positions or for the elements which determine the perturbed paths. An example of each is given and worked in detail. Corrected edition. Preface. Appendix. Index. xii + 302pp.  $5\frac{3}{8} \times 8\frac{1}{2}$ . Paperbound \$2.25

### STAR NAMES AND THEIR MEANINGS,

*Richard Hinckley Allen*

An unusual book documenting the various attributions of names to the individual stars over the centuries. Here is a treasure-house of information on a topic not normally delved into even by professional astronomers; provides a fascinating background to the stars in folk-lore, literary references, ancient writings, star catalogs and maps over the centuries. Constellation-by-constellation analysis covers hundreds of stars and other asterisms, including the Pleiades, Hyades, Andromedan Nebula, etc. Introduction. Indices. List of authors and authorities. xx + 563pp.  $5\frac{3}{8} \times 8\frac{1}{2}$ . Paperbound \$2.50

### A SHORT HISTORY OF ASTRONOMY, *A. Berry*

Popular standard work for over 50 years, this thorough and accurate volume covers the science from primitive times to the end of the 19th century. After the Greeks and the Middle Ages, individual chapters analyze Copernicus, Brahe, Galileo, Kepler, and Newton, and the mixed reception of their discoveries. Post-Newtonian achievements are then discussed in unusual detail: Halley, Bradley, Lagrange, Laplace, Herschel, Bessel, etc. 2 Indexes. 104 illustrations, 9 portraits. xxxi + 440pp.  $5\frac{3}{8} \times 8$ . Paperbound \$2.75

### SOME THEORY OF SAMPLING, *W. E. Deming*

The purpose of this book is to make sampling techniques understandable to and useable by social scientists, industrial managers, and natural scientists who are finding statistics increasingly part of their work. Over 200 exercises, plus dozens of actual applications. 61 tables. 90 figs. xix + 602pp.  $5\frac{3}{8} \times 8\frac{1}{2}$ . Paperbound \$3.50

## CATALOGUE OF DOVER BOOKS

### PRINCIPLES OF STRATIGRAPHY,

*A. W. Grabau*

Classic of 20th century geology, unmatched in scope and comprehensiveness. Nearly 600 pages cover the structure and origins of every kind of sedimentary, hydrogenic, oceanic, pyroclastic, atmoclastic, hydroclastic, marine hydroclastic, and bioclastic rock; metamorphism; erosion; etc. Includes also the constitution of the atmosphere; morphology of oceans, rivers, glaciers; volcanic activities; faults and earthquakes; and fundamental principles of paleontology (nearly 200 pages). New introduction by Prof. M. Kay, Columbia U. 1277 bibliographical entries. 264 diagrams. Tables, maps, etc. Two volume set. Total of xxxii + 1185pp.  $5\frac{3}{8}$  x 8. Vol. 1 Paperbound \$2.50, Vol. 2 Paperbound \$2.50,

The set \$5.00

### SNOW CRYSTALS, *W. A. Bentley and W. J. Humphreys*

Over 200 pages of Bentley's famous microphotographs of snow flakes—the product of painstaking, methodical work at his Jericho, Vermont studio. The pictures, which also include plates of frost, glaze and dew on vegetation, spider webs, windowpanes; sleet; graupel or soft hail, were chosen both for their scientific interest and their aesthetic qualities. The wonder of nature's diversity is exhibited in the intricate, beautiful patterns of the snow flakes. Introductory text by W. J. Humphreys. Selected bibliography. 2453 illustrations. 224pp. 8 x 10 $\frac{1}{4}$ . Paperbound \$3.25

### THE BIRTH AND DEVELOPMENT OF THE GEOLOGICAL SCIENCES,

*F. D. Adams*

Most thorough history of the earth sciences ever written. Geological thought from earliest times to the end of the 19th century, covering over 300 early thinkers & systems: fossils & their explanation, vulcanists vs. neptunists, figured stones & paleontology, generation of stones, dozens of similar topics. 91 illustrations, including medieval, renaissance woodcuts, etc. Index. 632 footnotes, mostly bibliographical. 511pp.  $5\frac{3}{8}$  x 8. Paperbound \$2.75

### ORGANIC CHEMISTRY, *F. C. Whitmore*

The entire subject of organic chemistry for the practicing chemist and the advanced student. Storehouse of facts, theories, processes found elsewhere only in specialized journals. Covers aliphatic compounds (500 pages on the properties and synthetic preparation of hydrocarbons, halides, proteins, ketones, etc.), alicyclic compounds, aromatic compounds, heterocyclic compounds, organophosphorus and organometallic compounds. Methods of synthetic preparation analyzed critically throughout. Includes much of biochemical interest. "The scope of this volume is astonishing," *Industrial and Engineering Chemistry*. 12,000-reference index. 2387-item bibliography. Total of x + 1005pp.  $5\frac{3}{8}$  x 8. Two volume set, paperbound \$4.50

### THE PHASE RULE AND ITS APPLICATION,

*Alexander Findlay*

Covering chemical phenomena of 1, 2, 3, 4, and multiple component systems, this "standard work on the subject" (*Nature*, London), has been completely revised and brought up to date by A. N. Campbell and N. O. Smith. Brand new material has been added on such matters as binary, tertiary liquid equilibria, solid solutions in ternary systems, quinary systems of salts and water. Completely revised to triangular coordinates in ternary systems, clarified graphic representation, solid models, etc. 9th revised edition. Author, subject indexes. 236 figures. 505 footnotes, mostly bibliographic. xii + 494pp.  $5\frac{3}{8}$  x 8. Paperbound \$2.75

## CATALOGUE OF DOVER BOOKS

### A COURSE IN MATHEMATICAL ANALYSIS,

*Edouard Goursat*

Trans. by E. R. Hedrick, O. Dunkel, H. G. Bergmann. Classic study of fundamental material thoroughly treated. Extremely lucid exposition of wide range of subject matter for student with one year of calculus. Vol. 1: Derivatives and differentials, definite integrals, expansions in series, applications to geometry. 52 figures, 556pp. Paperbound \$2.50. Vol. 2, Part 1: Functions of a complex variable, conformal representations, doubly periodic functions, natural boundaries, etc. 38 figures, 269pp. Paperbound \$1.85. Vol. 2, Part 2: Differential equations, Cauchy-Lipschitz method, nonlinear differential equations, simultaneous equations, etc. 308pp. Paperbound \$1.85. Vol. 3, Part 1: Variation of solutions, partial differential equations of the second order. 15 figures, 339pp. Paperbound \$3.00. Vol. 3, Part 2: Integral equations, calculus of variations. 13 figures, 389pp. Paperbound \$3.00

### PLANETS, STARS AND GALAXIES,

*A. E. Fanning*

Descriptive astronomy for beginners: the solar system; neighboring galaxies; seasons; quasars; fly-by results from Mars, Venus, Moon; radio astronomy; etc. all simply explained. Revised up to 1966 by author and Prof. D. H. Menzel, former Director, Harvard College Observatory. 29 photos, 16 figures. 189pp. 5 $\frac{3}{8}$  x 8 $\frac{1}{2}$ . Paperbound \$1.50

### GREAT IDEAS IN INFORMATION THEORY, LANGUAGE AND CYBERNETICS,

*Jagjit Singh*

Winner of Unesco's Kalinga Prize covers language, metalanguages, analog and digital computers, neural systems, work of McCulloch, Pitts, von Neumann, Turing, other important topics. No advanced mathematics needed, yet a full discussion without compromise or distortion. 118 figures. ix + 338pp. 5 $\frac{3}{8}$  x 8 $\frac{1}{2}$ . Paperbound \$2.00

### GEOMETRIC EXERCISES IN PAPER FOLDING,

*T. Sundara Row*

Regular polygons, circles and other curves can be folded or pricked on paper, then used to demonstrate geometric propositions, work out proofs, set up well-known problems. 89 illustrations, photographs of actually folded sheets. xii + 148pp. 5 $\frac{3}{8}$  x 8 $\frac{1}{2}$ . Paperbound \$1.00

### VISUAL ILLUSIONS, THEIR CAUSES, CHARACTERISTICS AND APPLICATIONS,

*M. Luckiesh*

The visual process, the structure of the eye, geometric, perspective illusions, influence of angles, illusions of depth and distance, color illusions, lighting effects, illusions in nature, special uses in painting, decoration, architecture, magic, camouflage. New introduction by W. H. Ittleson covers modern developments in this area. 100 illustrations. xxi + 252pp. 5 $\frac{3}{8}$  x 8. Paperbound \$1.50

### ATOMS AND MOLECULES SIMPLY EXPLAINED,

*B. C. Saunders and R. E. D. Clark*

Introduction to chemical phenomena and their applications: cohesion, particles, crystals, tailoring big molecules, chemist as architect, with applications in radioactivity, color photography, synthetics, biochemistry, polymers, and many other important areas. Non technical. 95 figures. x + 299pp. 5 $\frac{3}{8}$  x 8 $\frac{1}{2}$ . Paperbound \$1.50

## CATALOGUE OF DOVER BOOKS

### THE PRINCIPLES OF ELECTROCHEMISTRY, *D. A. MacInnes*

Basic equations for almost every subfield of electrochemistry from first principles, referring at all times to the soundest and most recent theories and results; unusually useful as text or as reference. Covers coulometers and Faraday's Law, electrolytic conductance, the Debye-Hueckel method for the theoretical calculation of activity coefficients, concentration cells, standard electrode potentials, thermodynamic ionization constants, pH, potentiometric titrations, irreversible phenomena. Planck's equation, and much more. 2 indices. Appendix. 585-item bibliography. 137 figures. 94 tables. ii + 478pp.  $5\frac{3}{8} \times 8\frac{3}{8}$ .  
Paperbound \$2.75

### MATHEMATICS OF MODERN ENGINEERING, *E. G. Keller and R. E. Doherty*

Written for the Advanced Course in Engineering of the General Electric Corporation, deals with the engineering use of determinants, tensors, the Heaviside operational calculus, dyadics, the calculus of variations, etc. Presents underlying principles fully, but emphasis is on the perennial engineering attack of set-up and solve. Indexes. Over 185 figures and tables. Hundreds of exercises, problems, and worked-out examples. References. Two volume set. Total of xxxiii + 623pp.  $5\frac{3}{8} \times 8$ . Two volume set, paperbound \$3.70

### AERODYNAMIC THEORY: A GENERAL REVIEW OF PROGRESS, *William F. Durand*, editor-in-chief

A monumental joint effort by the world's leading authorities prepared under a grant of the Guggenheim Fund for the Promotion of Aeronautics. Never equalled for breadth, depth, reliability. Contains discussions of special mathematical topics not usually taught in the engineering or technical courses. Also: an extended two-part treatise on Fluid Mechanics, discussions of aerodynamics of perfect fluids, analyses of experiments with wind tunnels, applied airfoil theory, the nonlifting system of the airplane, the air propeller, hydrodynamics of boats and floats, the aerodynamics of cooling, etc. Contributing experts include Munk, Giacomelli, Prandtl, Toussaint, Von Karman, Klemperer, among others. Unabridged republication. 6 volumes. Total of 1,012 figures, 12 plates, 2,186pp. Bibliographies. Notes. Indices.  $5\frac{3}{8} \times 8\frac{1}{2}$ .  
Six volume set, paperbound \$13.50

### FUNDAMENTALS OF HYDRO- AND AEROMECHANICS, *L. Prandtl and O. G. Tietjens*

The well-known standard work based upon Prandtl's lectures at Goettingen. Wherever possible hydrodynamics theory is referred to practical considerations in hydraulics, with the view of unifying theory and experience. Presentation is extremely clear and though primarily physical, mathematical proofs are rigorous and use vector analysis to a considerable extent. An Engineering Society Monograph, 1934. 186 figures. Index. xvi + 270pp.  $5\frac{3}{8} \times 8$ .  
Paperbound \$2.00

### APPLIED HYDRO- AND AEROMECHANICS, *L. Prandtl and O. G. Tietjens*

Presents for the most part methods which will be valuable to engineers. Covers flow in pipes, boundary layers, airfoil theory, entry conditions, turbulent flow in pipes, and the boundary layer, determining drag from measurements of pressure and velocity, etc. Unabridged, unaltered. An Engineering Society Monograph. 1934. Index. 226 figures, 28 photographic plates illustrating flow patterns. xvi + 311pp.  $5\frac{3}{8} \times 8$ .  
Paperbound \$2.00

## CATALOGUE OF DOVER BOOKS

### APPLIED OPTICS AND OPTICAL DESIGN,

*A. E. Conrady*

With publication of vol. 2, standard work for designers in optics is now complete for first time. Only work of its kind in English; only detailed work for practical designer and self-taught. Requires, for bulk of work, no math above trig. Step-by-step exposition, from fundamental concepts of geometrical, physical optics, to systematic study, design, of almost all types of optical systems. Vol. 1: all ordinary ray-tracing methods; primary aberrations; necessary higher aberration for design of telescopes, low-power microscopes, photographic equipment. Vol. 2: (Completed from author's notes by R. Kingslake, Dir. Optical Design, Eastman Kodak.) Special attention to high-power microscope, anastigmatic photographic objectives. "An indispensable work," *J., Optical Soc. of Amer.* Index. Bibliography. 193 diagrams. 852pp.  $6\frac{1}{8} \times 9\frac{1}{4}$ .

Two volume set, paperbound \$7.00

### MECHANICS OF THE GYROSCOPE, THE DYNAMICS OF ROTATION,

*R. F. Deimel*, Professor of Mechanical Engineering at Stevens Institute of Technology

Elementary general treatment of dynamics of rotation, with special application of gyroscopic phenomena. No knowledge of vectors needed. Velocity of a moving curve, acceleration to a point, general equations of motion, gyroscopic horizon, free gyro, motion of discs, the damped gyro, 103 similar topics. Exercises. 75 figures. 208pp.  $5\frac{3}{8} \times 8$ .

Paperbound \$1.75

### STRENGTH OF MATERIALS,

*J. P. Den Hartog*

Full, clear treatment of elementary material (tension, torsion, bending, compound stresses, deflection of beams, etc.), plus much advanced material on engineering methods of great practical value: full treatment of the Mohr circle, lucid elementary discussions of the theory of the center of shear and the "Myosotis" method of calculating beam deflections, reinforced concrete, plastic deformations, photoelasticity, etc. In all sections, both general principles and concrete applications are given. Index. 186 figures (160 others in problem section). 350 problems, all with answers. List of formulas. viii + 323pp.  $5\frac{3}{8} \times 8$ .

Paperbound \$2.00

### HYDRAULIC TRANSIENTS,

*G. R. Rich*

The best text in hydraulics ever printed in English . . . by former Chief Design Engineer for T.V.A. Provides a transition from the basic differential equations of hydraulic transient theory to the arithmetic integration computation required by practicing engineers. Sections cover Water Hammer, Turbine Speed Regulation, Stability of Governing, Water-Hammer Pressures in Pump Discharge Lines, The Differential and Restricted Orifice Surge Tanks, The Normalized Surge Tank Charts of Calame and Gaden, Navigation Locks, Surges in Power Canals—Tidal Harmonics, etc. Revised and enlarged. Author's prefaces. Index. xiv + 409pp.  $5\frac{3}{8} \times 8\frac{1}{2}$ .

Paperbound \$2.50

*Prices subject to change without notice.*

Available at your book dealer or write for free catalogue to Dept. Adsci, Dover Publications, Inc., 180 Varick St., N.Y., N.Y. 10014. Dover publishes more than 150 books each year on science, elementary and advanced mathematics, biology, music, art, literary history, social sciences and other areas.

(continued from front flap)

- Underwater Explosions, Robert Cole. \$2.75  
Applied Optics and Optical Design, A. E. Conrady. Two-volume set \$7.00  
Electrical Theory on the Giorgi System, P. Cornelius. Clothbound \$6.00  
Ionospheric Radio Propagation, Kenneth Davies. \$2.25  
Mechanics of the Gyroscope: Dynamics of Rotation, Richard F. Deimel. \$1.75  
Mechanics, J. P. Den Hartog. \$2.25  
Strength of Materials, J. P. Den Hartog. \$2.00  
Metallurgy in the Service of Man, W. H. Dennis. Clothbound \$7.50  
Hydrodynamics, Hugh L. Dryden, Francis D. Murnaghan, and Harry Bateman. \$2.75  
A Guide to Operational Research, Eric Duckworth. \$1.35  
Aerodynamic Theory, William F. Durand, editor-in-chief. Six-volume set \$13.50  
Mathematical Tables of Elementary and Some Higher Mathematical Functions, Herbert B. Dwight. \$2.50  
The Theory and Operation of the Slide Rule, John P. Ellis. \$2.00  
Theory of Elasticity, M. Filonenko-Borodich. \$1.75  
Differential Equations for Engineers, Philip Franklin. \$2.50  
Hydraulics and Its Applications, A. H. Gibson. Clothbound \$10.00  
Pulse Generators, edited by G. N. Glasoe and J. B. Lebacqz. \$3.00  
Modern Developments in Fluid Dynamics: An Account of Theory and Experiment Relating to Boundary Layers, Turbulent Motion and Wakes, edited by Sydney Goldstein. Two-volume set \$5.50  
A Treatise on Gyrostatics and Rotational Motion, Andrew Gray. \$2.75  
Inductance Calculations: Working Formulas and Tables, Frederick W. Grover. \$2.25  
Stream Flow: Measurements, Records, and Their Uses, N. C. Grover and A. Wm. Harrington. \$2.25  
Physics of Modern Electronics, W. A. Gunther. \$2.25  
The Principles of Electromagnetism Applied to Electrical Machines, Bernard Hague. \$2.25

Paperbound unless otherwise indicated. Prices subject to change without notice. Available at your book dealer or write for free catalogues to Dept. Eng., Dover Publications, Inc., 180 Varick St., N. Y., N. Y. 10014. Please indicate field of interest. Each year Dover publishes over 150 classical records and books in art, languages, philosophy, nature, literature, humor, mathematics, chess, puzzles and other areas.

# APPLIED MATHEMATICS

CARL E. SMITH

Radio engineers, technicians, and students of communications engineering will all find this elementary course in applied mathematics a highly valuable work, either as a handy refresher and review of basic principles, or as a helpful handbook of useful applications and tables. It may also be used as a self-contained home-study course for the student or worker with the equivalent of a high-school education.

Fully comprehensive, it ranges from the simplest operations of arithmetic to a treatment of calculus, series, and wave forms, including as well more than a score of the most useful tables of functions and formulas commonly employed by the radio engineer. Each chapter is followed by a number of carefully selected exercises, and contains in addition many examples with full solutions given, allowing the student to check his progress as each new topic is introduced.

The author begins with the basic fundamentals and formulas of arithmetic, logarithms, algebra, geometry, and trigonometry. He gives special emphasis to vector addition and complex quantities, including illustrations from electrical and radio theory. Following chapters cover the requirements of simultaneous equations in mesh circuits and quadratic equations in complex circuits having multiple resonance frequencies. Chapters on hyperbolic trigonometry, uses of the differential calculus in treating both algebraic and transcendental functions, integral calculus, and series and wave forms complete the expository section of the book.

Also included are 22 useful tables, covering the Greek alphabet, mathematical and engineering symbols and abbreviations, logarithms of numbers from 1-100, trigonometric functions, natural logs, exponential and hyperbolic functions in terms of nepers and in terms of decibels, Bessel functions, sine and cosine integrals, factorials of numbers from one to twenty and their reciprocals, useful constants, algebraic formulas, logarithmic formulas, complex quantities, trigonometric charts and formulas, exponential and hyperbolic formulas, useful integrals, series, and wave forms.

Unabridged republication of 1945 edition. Index. 166 exercises, 140 examples, all with answers. 95 diagrams. 22 tables. Short bibliography at chapter ends. x + 336pp. 5 $\frac{3}{8}$  x 8.

## A DOVER EDITION DESIGNED FOR YEARS OF USE!

We have made every effort to make this the best book possible. Our paper is opaque, with minimal show-through; it will not discolor or become brittle with age. Pages are sewn in signatures, in the method traditionally used for the best books, and will not drop out, as often happens with paperbacks held together with glue. Books open flat for easy reference. The binding will not crack or split. This is a permanent book.
